Within the boundary of the State of California are large tracts of swamp and overflowed lands which, when reclaimed and subjected to the cultivation they are susceptible of receiving, will by their products become capable of supporting a population equal in numbers to that which now inhabits the entire State. To many persons this statement may appear extravagant, and to others, who have doubts upon the practicability of reclaiming and cultivating these tracts of land, it may seem a declaration which should be followed by the proofs. The misfortunes which have attended the efforts to reclaim the swamp lands of California present many good reasons to doubt a result so important, and if it is not shown to be more from the inefficiency of the means used than from the impracticability of reclaiming this land, then those who doubt do so wisely.

At this time the swamp and overflowed land of California is either in a condition as profitless as when first surveyed or is imperfectly reclaimed and carelessly cultivated. To go upon these dismal swamps and look at them as they are in a natural state, or in the so-called condition of reclamation, it becomes difficult to bring the mind to the belief that upon land exactly the same in the quality of its soil and in its relation to the floods of the rivers and the tides of the sea, there now is maintained and has existed for centuries as high and refined a civilization as can be found among the nations of the earth. In relation to these waste lands of California, it may be said, "What has been done may again be done when like conditions exist." Upon swamps originally like the overflowed land in the Sacramento and San Joaquin valleys and on the margins of the bays of San Francisco and Suisun in the centuries past, a people founded a nationality whose record is among the proudest for deeds of dauntless courage on the fields of battle and for daring and enterprise on the seas.

To give any portion of the military or naval history of this remarkable race is not within the line or intention of this article; the desire is to briefly direct your attention to the mighty works of civil engineering and patient labor done on the lowlands of the Netherlands to illustrate what may be done on the lowlands of California.

The Manner of Reclamation.

The entire Kingdom of the Netherlands contains 12,650 square miles. This is an amount of land equal to a strip of country 42 miles wide and 300 miles long. Such an extent of land could be taken from the San Joaquin and Sacramento valleys and leave a marginal surplus. The number of the population, as estimated upon the last census of 1886, is at this time 4 800 000 people. The larger part of the entire State is protected from the storms and tides of the North Sea and from the currents and overflow of the river Rhine and other rivers of lesser magnitude by sand dunes and by dikes. The land thus protected from the ravages of the sea and rivers is drained by canals, whose water is pumped by windmills and by steam-power into the rivers or the sea, which at many places have an elevation of from 15 to 30 feet above the level of the canals. Do not understand that the greater portion of the reclaimed land in Holland is of a level so low as these figures would indicate, for these depths are only found in such "Polders" as the Haarlem, the Beemster, and perhaps a half-dozen like reclamations.

The last reclamation of importance was made in the construction of the North Sea Canal, extending from Amsterdam westerly to the North Sea, a distance of about 18 miles. This work was commenced by the construction of an immense dam of 1¼ miles in length, across an estuary of the Zuyder Zee, known as the "i j" (pronounced I). In the center of this dam were made five stone locks, three of which are adapted to the passage of vessels and two are for the regulation of the water in the canal. At the North-sea entrance to the canal there are three locks of granite, brick and iron, which act as barriers to the waters of the ocean and permit of the entrance and exit of the largest steamships engaged in commerce between Amsterdam and other seaport cities. This great work was commenced in 1865 and finished in 1876. The canal extending from Amsterdam to the Helder, through which the commerce of Amsterdam was formerly conducted, became insufficient as the tonnage of modern vessels increased.

To realize the importance of this great enterprise, imagine a dam built across the Bay of San Francisco from the drydock or Potrero Point to the nearest shore of Alameda, and at a distance of three-quarters of a mile from the city shore, and in the Bay of San Francisco, five enormous locks of granite, whose foundations are 40 feet below the surface of the water. Now see with your mind's eye two long levees or dikes whose foundations sink nearly 40 feet below the water level, and constructed as jetties are when made at great depth, but watertight; these levees or dikes running parallel to each other at a distance of 300 feet and extending a distance of 15 miles toward San Jose, and in the middle of the bay.

Now fancy, or bring your imagination to picture, the largest steamships which enter the Bay of San Francisco steaming through this canal, and all the water now in the bay on either side of the canal pumped out, and the bottom of the bay transformed into dry land, upon which an industrious and frugal people have built towns and happy homes, and have cultivated the land into pasture and grain-fields.

The steamships which pass from Amsterdam to the Atlantic ocean course along a canal whose waters are, for long distances, 20 feet above the land on both sides of it. This land was, 20 years ago, the holding-ground for ships' anchors; it is now cultivated into productive fields of grain or is devoted to pasture for cattle and has upon it thriving villages. The immense quantity of water which the bay contained was pumped into the ship canal after the dikes were completed, and by this channel they were discharged into the sea. The land thus recovered from the ocean was sold to the farmers for about $450 per acre, and it thus paid about one-third of the cost of the canal. The city of Amsterdam paid about one-fifth of the cost of the canal, the balance was paid from the National Treasury. As a work of water engineering this canal and the approaches to it from the North sea and the city of Amsterdam, rank among the highest of modern achievements.

To fully appreciate the engineering ability demonstrated by the works of Holland engineers in the construction of dams, dikes, jetties, etc., you should go upon those which are exposed to the storms of the North sea, which at times rage with all the violence of the Atlantic or Pacific oceans. Those who doubt the practicability of reclaiming the marsh lands of California should stand upon the dikes and dams of the Netherlands and the parts of North Germany contiguous thereto when the sea breaks during storms, with all the violence seen at Seal Rock or the entrance of the Bay of San Francisco, upon the outer side of those dams and dikes, while on the inner side, and lower than the natural surface of the sea, the industrious and happy people pursue their usual course of life, having confidence that no danger exists behind such barriers.

Unfortunately, practical water engineering, as taught in Holland, is not taught in any of the collegiate institutions of America. Certainly none of the graduates of these institutions have demonstrated any special knowledge of this subject in the works in California. With works constructed as they are in Holland, the swamp lands of California would be cultivated without fear of overflow, and the product of this cultivation would contribute immensely to the wealth of the State.

Canals of Irrigation and Drainage.

After the land is securely diked, the next work of importance in the reclamation is the drainage and the irrigation. As the largest portion of the reclaimed land in Holland is below the river or sea level, it becomes necessary to dig canals to drain it and to raise the water from these canals to such channels as will carry it to the sea. Holland is a country where the rainfall occurs in every month of the year, and it is more abundant than in California, so that both rainfall and seepage require lifting to higher levels.

In the "polders" or lands reclaimed from the water, the canals are made at distances from 400 to 800 feet from each other and usually parallel. The end sought is to drain the land when too wet, to irrigate when too dry, and to partition the land into fields, the canals acting as fences and as resources for manure, for the vegetation which grows in the water is raked out, put in piles, rotted and spread on the land to enrich it. The reclaimed land of Holland is as productive in grain, vegetables and pastures as the best found in Europe, and seems to have lost but little of its riches, even where cultivated for centuries. This is due to the depth and richness of the soil and the application of manure taken from the canals and the beds of peat. The division of the farms into fields by the canals enables the farmer to confine his cattle on one field, while the others are reserved for the harvest of hay, grain or other products.

The Holland Windmill.

Among the structures illustrated by paintings and engravings until they have become associated with the name of Holland, and come before the mind when it is directed to this country, are the windmills. Comparison of their unique and graceless outlines are made with modern windmills much to the credit of the latter, especially so when the valuable services rendered by the former are lost sight of.

The Holland windmills are usually built upon piles driven into the ground until a firm foundation is reached. They are either round or many-sided, with a base of from 25 to 50 feet in diameter, decreasing in dimensions to their summit, and are of a hight of from 40 to 60 feet. The fans are of great length, usually from 15 to 30 feet, always four to each mill, and made by crossing at right angles two very large timbers of from 30 to 60 feet in length. The fans are made oblique by a framework of light slats, so crossing as to support the sail. Over this frame a canvas sail is drawn when required for use and withdrawn when it is desired to have the mill motionless. The mills are so constructed in the interior that each revolution of the fans will cause, by a system of cogs, many revolutions of an Archimedean screw pump, which is placed at its lower part in the canal of supply, and at its upper part to the canal of discharge, at an incline of about 40°. These screws are from four to eight feet in diameter, and are so located to confine the water that in a fair wind a great volume of water is raised from the lower to the higher level.

Before the use of steam pumps these mills were a necessity in the reclamation of the swamps of Holland, and as they are very effective and are less costly in their workings than steam machinery, they have continued to keep in a cultivable condition the larger portion of the land. These mills were and are now used as saw and grist mills, and for these purposes they do the work required well. For the simple lifting of water it is doubtful whether modern science has discovered anything better than the Archimedean screw, whether propelled by wind, water or steam; and it is also doubtful whether there are any more effective windmills in existence, or any more capable of resisting the storms and tempests than the windmills which are so prominent in the landscapes of Holland, and which so often suggest the ludicrous to the traveler.

As valuable for the purpose of drainage as are the windmills, it must not be understood that all the improvements of modern steam machinery have been omitted. On the contrary, the steam pumps used in pumping out the waters of Haarlem lake and the bay known as the "i j," at the time of their reclamation, are models of effective machinery.

The Coals of Puget Sound.

The coal measures of the Puget Sound basin consist of alternate beds of yellow and gray fine-grained sandstone and very fine gray arenaceous shales interstratified with many beds of carbonaceous shale and coal. Mr. Willis in his report says: "Looking at the Puget Sound basin as a whole, the coal measures extend from beyond the British boundary south almost to the Columbia, and from the Pacific ocean eastward up into the Cascade range to elevations varying from 800 to 5000 feet above the sea. The coals of this district range in quality all the way from lignite, which still retains a woody structure, to anthracite. The magnificent forests so extensive on the western slope of the Cascades, with their luxurious and dense growth of vegetation, make difficult the development of these coal-fields, as well, also, as the determination of their extent. Coal, however, is known to exist from the northern to the southern boundary lines of the State, through a belt ranging from 10 to 30 miles in width. The general coal formation in the State is placed much the same as that of the anthracite of Pennsylvania, with the sides of the basins dipping at all angles from 15 to 90 degrees. The number of coal beds in the field is undetermined, but, judging from the great number of exposures and the varied character of the beds and rocks, it is large. Those already examined vary in thickness from 1 to 45 feet."

Coal from several different localities has been tested and found to produce excellent coke. With only a few mines developed to any extent, and with a greater number of our most promising mines not sufficiently developed for shipping, there was an output during the year 1889 of 1,000,000 tons, valued at $4 500,000. Of this amount, King county produced 450,320 tons. The output is increasing as rapidly as the capacity and number of mines will permit. The output for 1890 will considerably exceed that of the past year. Shipments from the Gilman mine alone, operated by the Seattle Coal & Iron Co., have been 29 000 tons from January 1st to June 1st. This mine is now producing over 350 tons per day, and as the shaft is extended the quality of coal improves. The total output of coal from Seattle from January 1st to June 1st, 1890, was 201,130 tons. When it is borne in mind that with the exception of two very small mines in California, producing coal of an inferior quality and in quantity not sufficient to be taken into consideration, and an annual output of 40,000 tons of an inferior quality from Oregon mines, there is no other State than Washington on the Pacific Coast possessing coal, the value and future of this branch of industry can be understood.

IMMENSE DEPOSITS OF TIN.—Joseph Hare, editor of *The Tin Miner*, of Hill City, S. D., in speaking of the tin mines at that place, says: "Hill City is situated exactly in the center of the tin belt, which is in the shape of a half-moon, and is about 30 miles in length and three miles wide. We are 28 miles from Rapid City, the nearest railroad point. The richness of these mines is simply wonderful, and one who has not been there can hardly believe it, but I state a fact when I tell you that there is enough tin on the dumps and in sight now to supply the United States for five years. As soon as the big mill is started at Hill City, we shall be able to ship the tin out in bars. Some of these mines have been pushed down 240 feet, and the deeper the richer. The vein is eight feet thick, and dips toward the east at an angle of about 45 degrees. Some of the mines average 27½ per cent of metallic tin, and the whole ledge averages 10 per cent. The capitalists interested are mostly New Yorkers and Englishmen. The larger part of the capital is furnished by New York men."

THE Seattle *Press* says that California redwood is being shipped to that city in large quantities.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FROM SUTTER CREEK.—*Ledger*, Oct 25: The activity and unusual stir around the Wildman is gradually abating. Many of the hands that have been engaged in digging ditch and laying the pipe have been dispensed with; the laying of the pipe being almost finished. The mortar blocks are in place, the battery posts are up and the floor laid. The mortars are delivered and will be in their places by the middle of next week; the stamps will he in the guides and ready to drop. The Frue concentrators are to he used and are on the way. Mr. Knight feels confident that be will have the mill in motion by the 10th of December. He has H. G. Murray in charge of the job. At the Sutter Creek mine they have extended their drift 240 feet on the 60-foot level, and made two upraises to the surface all through what they think is paying ore. Stoping is now in order. The 10-stamp mill is about completed and crushing will he commenced about the 25th.

ON THE NORTH STAR.—Develnpments here are progressing slowly. The ground is hard in each drift. The outlook is not what migbt be called bright and the stockholders are getting a little discouraged. There is some talk, bowever, in case there is nothing encountered, of cutting through the green stone east, as there is a possibility of the ledge being considerable farther east than was anticipated.

THE LINCOLN has been taking a rest for a few days, as the water has been turned off to enable them to repair the ditch and put it in order for the coming winter. There has been a force of men for nearly a week cleaning out and enlarging the ditch so that they can get more water to the mill. The ore in sight is of a paying character and sufficient to run for some time.

Butte.

WORK BEGUN.—Oroville *Mercury*, Oct. 24: The work at the Golden Gate mine is now, as ever, progressing with the greatest possible speed. The water is being pumped from the pools in the channel into the sub-flumes and to-day the work of stripping began on the river bed.

Del Norte.

GOOD QUARTZ.—*Record*, Oct. 25: Robert Melson came in from Big Flat last Sunday, bringing some fine specimens of quartz, discovered by him between Hayne's Flat and Big Flat. The quartz brought in is about the size of an almond, and is full of gold as large as a pin bead. Robert thinks he has struck the ledge, and if he has he can soon sign his name to a check with more than four figures.

BEACH SAND.—The Big Lagoon beach in Humboldt county has been located for mining purposes. The sand is said to he very rich.

Inyo.

MODOC AND VICINITY.—*Independent*, Oct. 24: The news from Lookout and the Modoc mines is very good. On Sept. 21st Frank Fitzgerald resumed work after the vacation with nine men. The force has since been increased to 21 men. Another team is necessary to haul ore, as the output is greater than the two teams now at work can take away. The first shipment since resuming work was made last Wednesday, the quantity being 21,000 pounds and the net value $7990. Stoffle, St. Clair & Co. have seven men at work on lease and are doing well, even after half of the ore goes for royalty to the owner of the mine, Mr. Fitzgerald. J. J. Gunn has resumed work on the St. John mine with a force of seven men.

AT CERRO GORDO.—A large amount of fine silver-lead ore is being taken out of the Keefe & Dunpby mine at Cerro Gordo. It is the property of the Union Con. Co. Work goes actively along in the old Union shaft, which is now about cleared out and put in condition to the bottom, 900 feet, for exploitation. No ore is being hoisted, though there is said to he considerable in sight in the old workings, but which cannot well he taken out until the ground is better secured. The old dumps, containing thousands of tons of waste and ores mixed, are being worked over with jigging machines, and are paying handsomely. The Farrington team brings down to Keeler a carload of shipping ore every day in the week, Sundays excepted. About 25 men are at work on the hill, mostly for the company.

THE MINNEATTA. — Near the Modoc is the Minneatta, the property of Fitzgerald and J. J. Gunn, and under lease by the latter, who this week has put on a number of men for the resumption of active work. This is a very fine paying property—one of the best in the country.

WILL LAST A LONG TIME.—It will take years to exhaust the ore already on the dumps of the Defiance, Cerro Gordo, Darwin and other mines in this region of country. The ores from the several lead mines above mentioned, when prepared for shipment, run from 45 to 65 per cent in lead and rarely, if ever, less than 70 ounces in silver, and some much more than that. These remarks are all from the casual observations of a hurried visit made without a thought at the time of a report in any form, therefore they are not offered as being either full or strictly correct. As remarked above, the mining outlook in general at this time is better than it has been for a long time.

ABOUT DARWIN.—The mining interests about Darwin are looking up considerably. Gould & Jackson, after about 1½ years of steady work in driving a tunnel on the Gypsy Queen, and, so far, without a dollar in return, have at last opened up quite a fair body of good ore and hope soon to get out a solid carload for shipment. The Lucky Jim is working six men and shipping considerable ore. The Defiance, Jas. McDonald superintendent, is working nine men in the mine and about twice that number on the dump and on the pipe-line, supplying the camp with water. There are bundreds of tons of rather low-grade ore in sight in the mine, and other bundreds of tons of fine ore in the dumps. All this, together with all the spargrades from the mine, is to be handled with crusher, jigs and rockers, all of which can be done cheaply and rapidly as soon as water is piped on to the ground, as it soon will he. With these added processes, particularly the jig which seems to be just the thing for lead ores, there is no doubt but this mine will he one of the best-paying mines of the country. A good deal of high-grade ore is being sacked directly from the stopes, aside from all this just alluded to. Mr. P. Reddy, principal owner, is rusticating at the mine, and no man is more deserving of the biggest success for pluck and bang-up than is he. There is no question now but that he will win. He is replacing some nine miles of water-pipe and doing much other expensive preparatory work.

Nevada.

WORK ON THE CHAMPION.—*Herald*, Oct. 25: Some important improvements are under way at the Champion mine. The quartz-mill is to be raised several feet in order to put in a rock-breaker and make other changes in the arrangement of the mill which will facilitate the handling of ore. The Champion Co. is having the old Merrifield mill, which it purchased some time ago, torn down, and will utilize such of the machinery as it needs in the other mill.

WILLOW VALLEY DISTRICT.—The new works of the Federal Loan mine in this district are nearing completion, and in a few days operations will be resumed. As yet it is not possible to work a large force of men, but it will not he long before the number of men employed will be greatly increased. Work on the Lecompton ledge in the same district is progressing quite favorably. Some fine rock is being taken out by Ott & Co. and a crushing will soon be had.

RIGHT UNDER IT.—The Harmony Drift Gravel M. Co. after several months of persistent work, are rapidly approaching the channel for which they have been running. An upraise made Monday disclosed the fact that the channel is only four feet above the tunnel. From the hole made up to it there came some genuine quartz gravel, such as gold is always carried in. The tunnel, or present drift, will not he quite low enough to work the lower portion of the claim through, but it will enable the owners to work out a majority of the ground. The Harmony's past record proved the channel to be rich, and there is no doubt but the present company will reap a rich reward for their enterprise. Gold will be coming out of the mine very soon now.

Placer.

AT THE MAYFLOWER. — *Republican*, Oct. 25: There are about 80 men employed at the Mayflower mine near Forest Hill. Half of them are miners underground, and the others engaged in various preparations for the winter work. The mill is crushing 12-hour runs five days in the week, and is crushing 375 tons of gravel a week with good pay.

Plumas.

A FINE PROSPECT.—*National*, Oct. 25: Last Saturday F. B. Whiting brought to this office a fine specimen of gold-bearing quartz recently taken from his claim at Rich bar. He has been engaged for several years in developing a ledge in that vicinity and now firmly believes that he has discovered the lead to a large body of gold ore. In former days Rich bar was exceedingly productive in the yellow dust, and considerable quantities are yearly shipped from that locality. The source of this great wealth has been eagerly sought after by many and it is to be hoped that Mr. Whiting has at last struck the true channel. The rock displayed was enormously rich and numerous croppings of free gold stood out prominently from their beds, surrounded by specks of glistening gold thickly scattered throughout the piece. Plumas county can furnish the quartz gold, and plenty of it, but to possess it one must get in and dig.

San Diego.

MORE MINES SOLD.—Julian *Sentinel*, Oct. 24: H. H. Davis, of Banner, this week sold to W. M. Goodman, for a good round sum, the Seventy-six mine. Mr. Goodman contemplates developing the property at once. He has a good vein of ore on the surface, and will mill it as it is taken out at the new mill now being erected by the Gold King Mining & Milling Co. Charles Bacon has sold the Joe Dandy mine and accompanying mill-site to Waldo S. Waterman and Jerome McDonald. The price paid was satisfactory all around and the property has gone into hands that will insure the working of the same.

BLUE HILL AT BANNER.—A rich ledge has been struck in the Blue Hill mine in the tunnel run into the mountain 150 feet. Several thousand dollars have already been taken out, the ore showing being considered extremely good.

Shasta.

THE TRINITY MINE.—*Free Press*, Oct. 25: This property, located at Dog Creek, is to be incorporated under the name of the Trinity Gold & Silver Mining Co. A tunnel 100 feet in length has been driven on the ledge, which is in the mountain 80 feet from the surface. The ledge is five feet wide in ore that averages between $60 and $70 to the ton. Ten stamps will he erected inside of 20 days. All but two miles of the wagon-road leading from Delta to the mine, a distance of six miles, is completed. Mr. Champion, owner of the Trinity, has also recently purchased an extension to that mine, and expects to develop it into a valuable property.

THE THOMSON MINE.—Considerable development has been made in this mine, located in the Lower Springs district. Mr. Thomson, after purchasing this mine of B. Swasey, commenced its development in a systematic manner, and while he has met with some discouragements, there is a fair showing at the present time. Visiting this property last Sunday, we found an open cut and a tunnel running in a westerly course about 300 feet. The tunnel then runs at a right angle some 30 feet northerly. About 17 feet distant from the commencement of the north tunnel another branch tunnel has been run, and at a distance of 37 feet there has been struck quite a ledge of rich quartz perhaps two feet wide; over the roof of the tunnel also appears quite a quantity of good ore. The ore has assayed all along as high as $500 to the ton. The only trouble has been the pinching out of the ledge, but now at quite a distance under the hill the ledge appears to he widening out, and William Sublett, who has charge of the property at present, thinks that further developments will produce a large ledge. It is proposed to sink a deep shaft with three compartments.

Sierra.

TO START UP.—*Tribune*, Oct. 24: The 40-stamp mill at the Mountain mine will start up to-morrow afternoon. This is an important event in the history of this district and everybody will hope that the promoters of that great mining enterprise will reap a profit of a thousand fold. Under the experienced management of Supt. R. B. Harper, the mine has been put in splendid condition and promises to outdo any of them as a bullion-producer.

GOOD FOR THE YOUNG AMERICA.—About the best news that it has been our duty to chronicle for some time is the striking of the vein in No. 4 tunnel at the Young America mine. It was encountered last Monday. Mr. A. C. Busch was up there the day following, and he reported that so far as the ledge was opened up it looked fine. Some quartz that he brought down prospected well in free gold.

THE OUTLOOK GOOD.—A great many of the old-timers are of the opinion that the outlook for prosperous times in this district was never better than it is at present. Well, why not? The mines are looking well and there is a great deal of prospecting going on in these hills. The ledge on which Jos. Perry and John Wilson are operating, located just north of town and adjoining the Sierra Buttes mine, is looking well. The parties expect to mill some of the quartz shortly.

TAPPED GOOD ORE.—*Mountain Messenger*, Oct. 25: The lower tunnel at the Young America quartz mine, tapped a ledge of rich quartz 18 inches wide (it is said) a few days since; the poorest of the rock was estimated to pay $14 a ton, and the richest many times that. This assures the future of this mine as a gold-producer.

THE SIERRA BUTTES MINE.—*Tribune*, Oct. 15: The Buttes is not to he dismantled or in other words abandoned. It is too late in the season to do much now, but next year the 20-stamp mill at No. 7 will be rebuilt and it will he erected in a place where snowslides will not he likely to reach it. In addition to taking out enough ore to keep the mill going there will he prospecting going on, and perhaps the future history of this mine will figure something after the Plumas Eureka, which mine our readers will remember went down to a very low ebb a few years ago. In fact operations were about to he suspended there, but a little further prospecting was done, a new body of ore opened up, and the mine to-day is paying handsome dividends. The Sierra Buttes is a big mountain and the mine named after it has been a big institution, too, but there is no reason to suppose that the great hill has yet delivered up all of its riches.

Siskiyou.

FROM HUMBUG.—*Telegram*, Oct. 25: A placer mine, right below McCook's mill, is operated by Jim O'Conner and his partners, who have no complaints to make regarding success. Jim was formerly connected with the Occidental Hotel of San Francisco, but thinks he likes mining best. Hegler Bros. & Aldrich at the Comstock No. 2, have been running their five-stamp mill night and day this summer, crushing the ore from a well-defined ledge of generous size, so favorably located that a minimum of labor will produce great results in rich quartz. The Spencer mine has the reputation of being the best piece of property on the creek. It has been under its present management less than two years; in that time it has paid for itself and also for improvements and fixtures of a first-class character.

THE NORTH STAR.—This mine on the head of Cornish gulch has been worked by a San Francisco Co. about a year and a half. The surface developments consist of a number of shafts, cuts and strippings, exposing the ledge and pay ore for a distance of over 1000 feet. The underground workings of the mine consist of a main tunnel 300 feet in length. At that point it crosses the ledge at a depth of 80 feet. Here a level is driven along the vein a distance of over 300 feet, showing a well-defined ledge averaging 18 inches to two feet in thickness of $30 ore. Winze or air connections are made to the surface. The arrangements for handling and reducing the ore are such as to produce the greatest results from a minimum of labor, and the entire works are a model of neatness and convenience.

ON LITTLE HUMBUG.—Over on Little Humbug Fabricius and Rider have been working a placer claim for some years. They have run a tunnel recently and were rewarded last week by striking a channel 50 feet wide which yields the best pay in coarse gold that they have worked in for a long time. I. F. Roberts, an experienced mining man of Colorado, has recently located on Little Humbug, and it is very sure that the place will justify his work upon it. He is a practical assayer and has found a ledge that he says will make the old settlers open their eyes when he gets at work on it.

Trinity.

GLOBE MINE.—*Journal*, Oct. 25: Dave Tighe reports having sunk 15 feet on the Globe mine and the ledge is about four feet wide in the bottom of the shaft and averages well. More work will be done as soon as proper arrangements can he made to hoist the ore from the shaft.

EXPERTS ARRIVE.—Hon. J. H. Neff of Placer Co., accompanied by J. B. Hobson, arrived Monday on a visit to East Fork to take a look at the mines in which Mr. Neff is interested. They left Thursday.

Tuolumne.

GOOD POCKETS AND PROMISES. — *Independent*, Oct. 25: The Fuchs mine on Sawmill Flat, owned and operated by Oliver, Oaks & Co., yielded another pocket last Monday; between $4000 and $5000 were realized. The Faxon mine on Saratoga hill is looking very rich and promises to yield considerable gold before long. The Sanguiseppi mine is looking as well as ever, and last week Supt. Whorf let out a contract for extracting ore by the ton.

NEVADA.

Washoe District.

ON THE COMSTOCK LODE.—*Territorial Enterprise*, Oct. 26: The following table is arranged from the weekly reports of the mining superintendents, and represents the number of tons of ore crushed the past week, value per ton according to battery samples, and totals:

Mine.	Tons.	Value.	Total.
Con. Cal. & Va.	1,610	$22 14	$35,645
Belcher	328	23 12	7,583
Crown Point	440	13 73	6,481
Challar	535	18 50	9,897
Alta	315	18 00	5 670
Yellow Jacket	546	18 00	9,828
Overman	368	17 00	6,265
Justice	191	26 03	4,997
Savage	390	22 27	19,152
Occidental	259	22 31	5,778
Totals	5,453		$111,287

The above figures are given and calculated upon the basis of the value of silver at par, or 1 29.29. About 56 per cent of the bullion is silver. If the mills work the ore up to 80 per cent of the battery assays, the yield of the Comstock would be for the past week, $89,029.60. The discount on silver would be on 56 per cent of the latter sum, or on $49,856, $12,700, leaving a net product for the past week of $84,444, which is $7860 more than it would he at the price of silver under Grover Cleveland's administration. The yield of the past week may be properly used as an average weekly yield for the 52 weeks of the year 1890. This would make the product of the year $4,435,528. Last March the *Enterprise* estimated that the yield for 1890 would be $5,000,000 and the *Chronicle* estimated it at $8,000,000.

SIERRA NEVADA.—The southwest drift started on the 630 level has been advanced 45 feet in a soft porphyry formation, showing some seepage of water.

UNION CON.—East crosscut No. 2 from the north lateral drift, 1465 level, extended 32 feet; total, 160 feet, continuing in soft porphyry carrying clay slips and fine lines of quartz.

MEXICAN.—On the 1535 level the new winze has been sunk 20 feet during the week—total depth 65 feet. Bottom in soft porphyry.

OPHIR.—From the prospecting winze sunk below the sill floor of the 1300 level we have followed the streak of ore in a northeasterly direction, continuing to extract some ore therefrom. This streak is narrowing and the ore becoming of poorer quality.

CON. CALIFORNIA & VIRGINIA.—1200 level—Continue the extraction of some milling ore along the line of the north drift. 1300 level—Ore of a fair quality is still being extracted from the junction with the upraise. 1500 level—Ore extraction continues on this level north and south from the upraise connection with the drift northwest from the old stopes. 1600 level—Have continued to extract ore along and above the line of the drift run east through the old stopes on the sill floor of this level. We are also working southerly from this drift, stoping out ore. 1650 level—During the week we have taken out ore of the usual quality and quantity. North lateral drift from the Con. Va. shaft has been extended 191 feet. East crosscut has been extended to 77 feet, connecting with the northwest drift from the C. & C. shaft. Spots of ore are found along this crosscut. 1750 level—The air fan, together with pipe connections completed, and have resumed in the face of the drift southwest from the north drift from the C. & C. shaft, which has been reopened a distance of 190 feet, repaired and retimbered. There has been extracted during the week from all parts of the mine 1595 tons of ore, which was shipped to the Eureka mill; battery sample assays show an average value of $22.14 per ton; 1610 tons milled. Bullion shipped to the Carson Mint assay value $41,474.

Cedar District.

IMPROVEMENT.—Pioche *Record*, Oct. 25: The Banks Bros. among the first locators in this district, report great improvement on their mines. In one of their mines a small stringer of ore was found of good grade which gradually opened up as they progressed, and now at a depth of 12 feet it is two feet wide and the average assay is 200 ounces per ton. Development will he continued and work pushed as fast as practicable. A complete working outfit has arrived, and the material will he used in developing mines recently purchased by outside parties. W. S. Gnthe has purchased a one-fourth interest in the McGuire & Co.'s mines. These mines are reported to he fine property, and large quantities of 100-ounce ore in sight.

Hawthorne District.

RICH ORE. — *Territorial Enterprise*, Oct. 23: The Confidence mine in the Gillis range, Esmeralda county, belonging to Knapp & Laws of Hawthorne, is a very valuable property. Recent results from ore worked at the Mt. Diablo mill ran 25 per cent copper and from 700 to 800 ounces in silver per ton. The property paid four dividends during the summer months.

MINES ATTACHED.—A United States marshal recently levied upon the mining properties of the Manhattan Co. at Austin, for $150,000. The old Manhattan mill, which has ground out $1,000,000 on the average for about 25 years, has been dismantled, and what little ore is extracted from the mines of that once busy district has to he shipped to Salt Lake or elsewhere for reduction.

MT. DIABLO MINE.—The Mt. Diablo mine, Candelaria, is making usual development progress and showing splendidly in all quarters. It has paid $189,000 in 19 dividends, and there are many other dividends in sight. The mill runs right along, doing all that is required of it.

ORE STRIKE. — Walker Lake *Bulletin*, Oct. 22: Silver ore assaying $500 to the ton has just been struck in one of the company's mines at Ione, Nye county.

ALASKA.

GOLD, SILVER AND COAL.—The schooner Dora, lately arrived from Alaska, picked up on her way down from Oonalaska several miners at Unga island, where the Apollo Con. M. Co. is developing some valuable gold and silver mines. Thomas Pillington, who returned on the Dora from an eight-months' stay at Unga, says that the company is operating a five-stamp mill which was erected last spring, and the outlook for the mines is very bright. The Co.'s coal mines at Tbin Point, 43 miles east of Unga, promise development on quite a large scale. During last summer, 800 tons of coal were mined there and supplied to Government vessels and to the Alaska company's steamers.

ARIZONA.

ANOTHER TURQUOISE STRIKE.—*Prospector*, Oct. 20: Si Bryant has made a strike in his mine at Turquoise that is said to he an immense one. He worked through into a cave which is ore on all sides and the bottom of it shows 30 feet. It is said to he the biggest strike yet made in that camp. No man deserves success more than he and his friends will he glad to hear of it. This camp, about 27 miles from Tombstone, may become a greater one than Tombstone. The G. W. Seaverns silver mines are here.

GOOD REPORTS.—Prescott *Courier*, Oct. 25: Dave Gruhh, just from Hassayampa district, says mining is all right there. We have similar news from Big Bug, United Verde, Bradshaw and other districts. Large teams, hauling gold sulphurets from the Congress, arrive here each day. Wm. Conners

owns ledges on Boulder creek, one of which has assayed as high as $500 a ton, gold. Top rock assayed $100 a ton. The Catoctin mine, Hassayampa district, is looking exceedingly well. The ledge is almost five feet wide and very rich in silver. It is a regular dividend-payer. Ex-Governor Tritle has bought the Rubert mill and some mines near Skull Valley, from Messrs. Russell, Cowper and Rubert.

MOHAVE COUNTY.—*Miner*, Oct. 25: The lower levels of the Esmeralda mine are looking fine, and a good showing of ore is being uncovered. It is rumored that the Diamond Joe mine will soon start up with an American as superintendent. Rogers, Shippee & Sherrick have struck a streak of gold ore on the Tintic that goes over $100 in gold and about 15 per cent in lead. We don't know what the exact width of the streak is, but they have taken out chunks as big as a whisky barrel.

THE SILVER KING.—*Journal-Miner*, Oct. 22: Another rich strike is reported to have been made a few days since in the Silver King mine. A good-sized body of ore was encountered which goes $400 to the ton.

COLORADO.

GEORGETOWN ITEMS.—*Courier*, Oct. 18: The largest and best body of ore yet found in the Oneida mine was encountered recently. Lynch and Ward brought in a jack trainload with ore from the Cashier near Argentine Pass last week that returned at the mill 165 ounces silver to the ton and 12 per cent lead.

CLEAR CREEK NOTES.—Idaho Springs *News*, Oct. 24: The Commonwealth mill is working night and day this week. John Davis has taken a contract to drive the Lincoln tunnel a distance of 1000 feet. Chamberlain & Co.'s sampling works have been crowded with ore during the past week as they never have been in their past history.

ASPEN NEWS. — *Times*, Oct. 23: The roads have been so muddy of late that the ore-haulers of the Little Annie Co. have had a hard time of it. The company has been retarded in work by having to procure greater pumping machinery. News from the Black Queen mine at Crystal partakes of the bonanza character. Since the development of the mine was last spoken of in these columns, the rich ore body has been followed up a considerable distance without any limit having been reached. An important strike was made yesterday in the Silver Star. It is another illustration of what deep mining will do, and the bonanza properties of Tourtelotte, which have been great producers from ore bodies near the surface, may have yet far richer mineral down deep in the earth.

DAKOTA.

DEADWOOD DISTRICT.—*Pioneer*, Oct. 23: The Maggie mine of Ruby Basin is now working 12 men and taking out from 25 to 30 tons of ore daily. The ore is all high grade, averaging between $40 and $46 a ton.

SILVER QUEEN.—The Silver Queen of Galena will shortly recommence taking out ore for shipment to Omaha, when the railroad reaches Galena.

NEW DISCOVERY.—A well-known gentleman of Deadwood was exhibiting some samples of ore yesterday which he claimed would go $50 a ton. He stated that the rock was from an entirely new district, but refused to divulge the whereabouts of the El Dorado.

RICHMOND.—The Richmond at Galena, which has been shut down for the last two weeks, started up again on Monday morning.

IDAHO.

SILVER CITY PROGRESS.—Silver City is to have an ore sampling and purchasing works. This will greatly assist mine development in that section.

ENGLISH CAPITAL.—Boise *Statesman*, Oct. 18: The Atlanta lode, which has produced over $3,000,000, and which was considered one of the richest mines in Idaho when work was suspended several years ago, has been sold to London capitalists. Every claim is secured by a United States patent, and the price paid is $600,000.

ROCKY BAR ITEMS.—Elmore *News*, Oct. 18: Everything is moving in good shape at the Ophir mine, and if Supt. Boyd is not restrained by his company he will in a short time astonish the natives with the Ophir output of gold. The Elmore new shaft is being extended down to the 600-foot notch in a rapid and satisfactory manner. E. C. Towne has recently been doing some development work on the John Boyle claim—one of the Jim Blaine group—and he is unearthing some very rich ore. The John Boyle is doubtless a continuation of the great Ophir lode.

MERITED FORTUNE.—Wood River *Times*, Oct. 23: Ore was struck in the shaft of the Camas No. 1 mine, last Friday, at a depth of 122 feet from the surface. This was somewhat unexpected, as the contract to sink was let with the intention, on the part of the management, to attain a depth of 125 feet and then drift for the vein. The ore is said to be similar in every respect to that found in the Camas No. 2. This being the case, it is evident that another bonanza has just been uncovered on the Gold Belt.

GOOD ORE.—Silver City *Avalanche*, Oct. 18: On the Midas lode, belonging to the Stoddard group at Wagontown, the quartz has been assayed and found to run upward of $50 per ton. The Manhattan Mining Co., Messrs. Davies & Howe, have encountered very rich ore in their mine and are taking out some fine nuggets of horn silver. This mine joins the Wilson on the northwest.

LOWER CALIFORNIA.

NEWS FROM ALAMO.—San Diego *Sun*, Oct. 20: Alamo continues to turn out gold. Four mills are hard at work and arrangements are being made to start up the El Paso Co.'s 10-stamp mill. The Santa Clara Co.'s mill will soon receive an addition of five stamps, as ore is being taken out of the Aurora faster than it can be milled. Night and day shifts are working since the pump was put in. The Manzanita Co. is rushed with orders for crushing custom ore. Several new rock-crushers have been ordered to keep up with the demand. The Princess mill is running day and night on the company's mines, principally the Ulysses and Indio. Probably the best strike ever made in the district was uncovered last week in the Ulysses. In drifting along the ledge on the 100-foot level, a new vein was encountered which joined the old vein at an acute angle. The point of junction was cut and the vein showed a width of five feet, every foot of which yielded quartz fairly bristling with gold. A contract for an air shaft 100 feet farther along was immediately let, and drifting was started alongside the new vein toward the shaft. The ore body held its size and richness the entire length.

AT REAL DEL CASTILLO.—San Diego *Union*, Oct. 18: The St. Nicholas mine at this place has been bonded by Manuel Gonzales. It had been idle since February, and a steam pump was set to work to get the water out and put it in shape for working. Saturday, A. Morales, the original owner, and J. M. Villagrano arrived from the peninsula and reported that they and the Ybarra Bros. of Ensenada had sold their interest in the property to Manuel Gonzales & Co. The debts against the mine have all been settled so far as Lower California is concerned, and ex-Gov. Ryerson, president of the outgoing company, will come to San Diego and settle all accounts held here against the mine.

MONTANA.

PROSPEROUS BUTTE.—*Inter-Mountain*, Oct. 22: The past week has been one of quiet prosperity among the mines of this district. Every smelter in the camp is running at its full capacity, there being no shortage of ore. The Princess Co. has received returns from a carload of ore recently shipped which makes the excellent showing of $72.80 in gold and $14.58 in silver. The stockholders are greatly elated.

VIRGINIA CITY DISTRICT.—*Madisonian*, Oct. 25: Work on the mines at the head of Meadow creek is being prosecuted with vigor, and they continue to improve with development. The Bedford Con. Mining Co., of which Mr. Joseph R. Muffly is the manager, is rapidly perfecting its plans for the erection of a smelter on its property and the vigorous working of the mines. Messrs. Elling & Morris are doing considerable preliminary tunnel work on their Pony mines preparatory to resuming active operations. The difficulties between the Pony Gold Mining Co. and its creditors have been settled, and there is no longer cause for delay in working these great properties.

IMPROVING.—Anaconda *Review*, Oct. 23: The last carload of ore shipped to Butte from the Silver Lake properties averaged 108 ounces to the ton, which is a very fine showing. At present the two big mines, the Anaconda and St. Lawrence, are beginning to touch upon their old-time prosperity. The Anaconda is raising ore from the 500, 600 and 700, there being an abundance of ore on these levels to last an unlimited time. All the levels in the Anaconda have again been placed in repair, and they now resemble their condition before the fire.

A SPOTTED BONANZA.—*Mining Review*, Oct. 22: A recent shot put in the Spotted Horse mine, at Maiden, is said to have thrown out specimens of ore that assayed $8000 in gold to the ton. Over 70 men are at work on the property, which not only shows up better than ever, but is constantly improving. The career of this mine is beginning to read like a romance. Each time after having to all appearances "petered" out, it has deluded the experts by bobbing up serenely with a greater store of treasure than ever.

NEW MEXICO.

LORDSBURG ITEMS.—*Western Liberal*, Oct. 17: Wednesday the Hercules mill was sold by Sheriff Whitehill. It was bought in by M. W. McGrath for the face of the judgment and costs, which amounted to $1388.19. Col. Marcus Huling, accompanied by his son Ward H. Huling, arrived in town Saturday night. The Colonel informs the *Liberal* that he has a large mill coming and that in a short time the affairs of the Standard Mutual Co. at Shakspeare will be on a boom.

OREGON.

MINERAL WEALTH OF JOSEPHINE COUNTY.—*Courier*, Oct. 25: Col. A. J. Straight expresses the opinion that there is enough ore in sight in Josephine county to justify the building of a road to Grant's Pass; and further than that, he considers this county one of the most promising fields on the Pacific Coast for experienced mineralogists, for he believes that not only gold and copper mines will be found in Josephine in abundance, but nearly all the other metals—silver, tin and nickel. He has also found excellent limestone, fine gravel and sandstone for building purposes. He added that if Colorado or Montana contained such unexplored fields of wealth they would make more noise about it than Chicago is doing over the World's Fair, and would get men of experience, men from all parts of the world. Thousands of dollars have been taken out of this county, but in the next 25 years there will be dollars where there have been cents.

UTAH.

THE CRESCENT MINE.—*Advertiser*, Oct. 19: At the annual meeting of the Crescent M. Co. the following facts were reported: During the year 3642 feet of drifts, crosscuts, raises and winzes were run, while the quantity of ground stoped amounted to 228,000 cubic feet.

THE MARY MINE.—The ore taken from the Mary mine at Bingham is free-milling carbonates. Hundreds of tons of low-grade ore have been thrown over the dump that will be well worth working as soon as a mill is put up for its reduction, which will likely be in the near future.

PROSPEROUS BINGHAM.—*Tribune*, Oct. 21: The Stewart tunnel, Bingham, is now in over 1400 feet, and at the heading there is much water and vein matter. This indicates that they are near the vein on the Saratoga and Washington for which they have been driving. They expect to start the Stewart mill early next month and keep it running.

ALL BUSY AND PROSPEROUS. — Everybody at Bingham is busy and doing well.

LEAD AND BROOKLYN. — Both the Lead and Brooklyn mines are doing nicely, and are sending out in first and second-class ores some 75 to 100 tons per day.

YOSEMITE NO. 2.—The Yosemite No. 2 is sending out an average of 300 tons of ore per month. The shaft lately reached a depth of 800 feet below the working level, and they are now cutting back to the vein, a distance of 20 feet, and will soon begin extracting ore from that end.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Oct. 30, 1890.

Notwithstanding the election engages attention of all, general trade is good. The buying does not appear to be confined to any particular locality.

The local money market is easy, although in some quarters it is said to be close. Remittances from the interior are free. Australia is sending us considerable gold for exchange purposes.

MEXICAN DOLLARS—The market is somewhat unsettled. The only buyers are Chinese. Large holders ask 84c to 85c, while some from outside sources (generally short sellers) are placed at a lower range.

SILVER—The Mint has not been in the market, having bought the last of the stipulated 4,500,000 ounces several days ago. Until the Mint is again in the market, which will be on next Monday, the quotations will be nominal. There is considerable silver held here for better prices. The market abroad and at the East has suffered from a well-organized bear raid. Large quantities held on a margin have been uncovered, and passed into stronger hands. Yet, even with the latter's buying, prices may go still lower on the next break. It looks as if the speculative pool has determined on bear raids until all large outside speculators are forced to sell, after which set in on a bull movement. The output of silver does not show any material gain, but on the contrary it looks as if there is a falling off on this coast.

QUICKSILVER—The market is steady at the lower prices. For quicksilver in bond, $52.50 is quoted. Receipts the past week aggregate 107 flasks, and exports, 156 flasks to Mexico.

LIME—Receipts the past week aggregate 5876 bbls. Notwithstanding the heavy receipts, all have gone into distribution. Clear weather is favoring sellers.

BORAX—Receipts the past week aggregate 758 ctls., and exports 21,046 lbs. to New York and 1180 lbs. to Mexico. The market rules firm at full prices. The East reports a strong market.

LEAD—Receipts the past week include 500 bars from Tacoma and 350 from Portland, Oregon. The market holds to strong prices. The opinion prevails that the market has, for the present, seen the top.

COPPER—The market holds to strong prices. The statistical position abroad continues to favor the holding interests. The *Iron Age's* cablegram from London reports on Oct. 22d as follows: "The disturbed condition of the stock markets has had a rather unfavorable bearing upon speculative operations in copper, but favorable statistics of movement and heavy consumption served to check the downward course of prices. The visible supply decreased about 1800 tons during the first half of the month, and receipts since then have been moderate. Sales of furnace material are difficult to make, however, as consumers' wants are well supplied by deliveries making on previous purchases."

TIN—Tin plates are stiff, but pig is only maintained by a strong corner. The consumption is light, but heavy consumption is expected in next year. London cables report tin plate strong with San Francisco still buying.

IRON—Foreign markets are rather mixed. Germany's is weak at lower prices, while the English market is feverish. The Eastern markets are easy with the tendency downward under free offerings at lower prices of good outside brands.

COAL—Imports the past week aggregate as follows: Departure Bay, 4516 tons; Seattle, 5013; Sydney, 1357; Comox, 2150, Nanaimo, 1300; Tacoma, 2850; Coos Bay, 700, total, 17,886 tons. The market is very strong for spot, under a continued good demand. The warm weather is against household coals, yet dealers say cold will come, when more of that grade will go into consumption. About one-third of the usual number of miners are at work in the Wellington collieries. Imports from these mines are coming to hand. From Australia reports are confirmed of the miners in one district going to work, while in the leading district they are still on a strike. Considerable English coal is on the way. Cars for bringing Cherry Valley and Rock Spring coals to this market will be obtainable soon.

San Francisco Metal Market.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 21, 1890.

438,761.—CABLE GRIP—J. W. Gentry, Oakland, Cal.

438,808.—STENCILING BRUSH—J. I. Hansen, Portland, Or.

439,081.—SAFETY DEVICE FOR ELEVATORS—John Hatch, S. F.

439,067.—CHURN—W. J. Hersom, Stockton, Cal.

438,926.—SOLDERING MACHINE—M. Jensen, Astoria, Or.

439,072.—FRUIT-DIPPING APPARATUS—D. D. Jones, San Jose, Cal.

438,689.—STATION INDICATOR — J. Kueffer, S. F.

438,690.—SEWING MACHINE — M. Lachman, S. F.

438,752.—PIPE-COUPLING—E. Lawson, S. F.

439,082.—TOY TARGET—E. E. Lommatzsch, S. F.

439,183.—CHILO'S BEO LOUNGE—A. Morris, S. F.

439,084.—WINE-COOLER—A. S. Morton, Suisun, Cal.

439,085.—RAILWAY CAR—C. W. M. Smith, S. F.

438,649.—RAZOR-STROP—G. Spiess, S. F.

438,784.—TELEPHONE—J. C. H. Stut, S. F.

The following brief list by telegraph for Oct. 28, will appear more complete on receipt of mail advices:

California—Henry S. Brink, Biggs, cultivator; James B. Burrell, Wrights, machine for cutting boards; Elswood Chaffey, Santa Monica, mechanism for transmitting power; Leopold Dahlstrom, assignee of one-half to R. Menzel, Santa Clara, valve mechanism for double-acting pump; James C Gibson, S. F., clutch pulley; John J. Griffith, San Bernardino, burglar-alarm; Stephen C. Houghton, assignee of one-half to L. C. Branch, S. F., adjustable seat-back; Augustus A. Lamont, Santa Rosa, cuff-holder; Perham W. Rahl, S. F., navigable air ship; D. F. Oliver, Oakland, assignee to Hooker & Co., S. F., vehicle seat; James E. Pellow, Sierra City, leaf-turner; Daniel W. Williams, Fortuna, shingle-shaping machine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

Mining shares the past week under review continued unsatisfactory for outside operators. The only relief from the monotony was a short-lived spurt in Andes, which failed to awaken other stocks from their drowsy condition. The foundation for the moves in Andes is hard to find out. Some say they are made on shorts, while others think they are based on promised developments later on. At any rate, the stock is active compared with others. A close and careful watching of the moves in the various stocks more than ever convinces the writer that they are being concentrated, and it is only a question of a short time when the market will go up, although before going up, they may shade off still more. This is the more apparent when the street has it "wait for a break, when buy." So far there has been no break, only "wasting away." The street is more mixed than ever, and is grasping at all kinds of wild rumors set afloat by either designing persons or by those who wish to see "what fools we mortals are." But they have the effect of frightening the timid operator, and nearly all outsiders are timid. In outside stocks the Quijotoas have been strong under the leadership of Silver King (the Silver King mine is in another district about 60 miles distant, but it goes with the Quijotoas). The Tuscaroras have been quiet but strong. The Bodies have flopped around in a mysterious manner. The general belief is that the Kelleys are trying to market their stock, and consequently the street fears to buy, even with the Bodie mill running and the very best advices from the mine coming to hand. Of course there are a few hulls, or at least they talk so.

Unquestionable information from the Comstock mines is confirmatory of very rich ore to the west in both the Ophir and Con. Virginia workings. This deposit is undoubtedly the downward continuation of the Red lode. There is apparently a quiet but determined three-cornered fight for control of the ore deposits. The Andes, West Con. Virginia and Con. Virginia are after it. Time alone will determine to which it belongs.

From the Comstock mines the news is of a very encouraging character for early results from the prospecting work being pushed in several of the mines. Much of the work is still of a secretive character, which in time will be made public through the usual skeleton letters from high-salaried superintendents. There can be no doubt but the "powers that be" are preparing a surprise for the public; like all their surprises, it will probably end in the garrulous public buying at high prices the now cheap stocks being bought by the inside. The official letter received yesterday from Crown Point notes more active prospecting work inaugurated and higher battery assays. In Seg. Belcher the work is becoming quite interesting, as it is in Belcher, Yellow Jacket, Confidence, Alpha and Con. Imperial. The decline in the Hale & Norcross and Savage stocks causes experienced miners to look with confidence for good results from the work going on in the two mines. The work under way in the middle and north end mines is being closely watched. After the State election next week, more news will probably be given from the mines.

From the outside mines the news from the Tuscaroras, Quijotoas and Candelaria mines is of a favorable character. From the Bodies our advices report more active prospecting in Bulwer. In Bodie the work begins to attract renewed interest from better informed miners. Some are looking for better results than have been had for many years past. The ore being milled is said to be high grade and all gold. The superintendent of the mine should conform to the law and report the number of tons of ore milled, the mine and battery assays, and more detailed information regarding the work in the mine.

The Bodie mill started up on Oct. 6th, and the first shipment of bullion was received to-day, amounting to $15,500. Other and larger shipments will follow every few days. The share market closed stronger and higher for the Comstocks.

MECHANICAL PROGRESS.

Band-Saw Mills.

The Vulcan Iron Works of this city recently shipped a hand-saw mill to the Elk River Lumber Co. of Eureka, Humboldt county, which is described by the *Pacific Lumberman* as follows: It has 8 foot wheels, and carries an 8 inch saw 50 feet long. In this style of mill the upper wheel is a spoke wheel, and the lower wheel is a web center or plate wheel, but in their other style the lower wheel is also a spoke wheel. The form and great strength of the main column and the front-supporting column of the upper-wheel shaft are such that there is no danger whatever of any vibration. The back-supporting column of upper-wheel shaft is guided by strong boxes securely bolted to main column. The bearings in which the shaft rests are trunnion hearings, and the back box has in addition side adjustments, by means of set screws placed at the end of the trunnion shaft, and also has a very convenient vertical adjustment.

The strain is first put on the saw by means of a simple method of worms and worm wheels, and is here taken up by the weights at the end of the long lever.

The bearings of the lower-wheel shaft are also trunnion hearings, and the back bearing has a very efficient vertical adjustment. These easy adjustments of the two-wheel shafts will be readily appreciated by any one that has ever run a band-saw mill, or who knows their necessity in being able to out good lumber. The upper-gnide arm is moved by means of a strong screw and connections, arranged for rapid and effective work.

There is no complicated mechanism around any part of the mill, and all parts are easy of access.

The Vulcan Iron Works are one of the leading manufacturers of saw-mill machinery, and the only manufacturers of hand-saw mills on the coast. They have made a study of the requirements of the work to be done here, and are building a hand-saw suited especially for the Pacific Coast. All parts are made unusually strong and heavy for the special work required, and no pains nor expense is spared to make it a complete machine for the purpose intended.

In Regard to Large Band-Saws.

Industry of this city in speaking of large band-saws says: This is a subject we take a special interest in and have had some experience with, so will say that the makers of band-sawing machinery have for 20 years past been inventing and improving the machines without any notable advancement, because the difficulties met with have not been in the machines at all, but in the saws. Almost any kind of a machine will operate a band-saw that is in proper order, and no kind of a machine will operate a saw that is not in such order. In the first place the teeth must be stiff and obtuse, also must be thin at the point and sharp. These two things are directly opposed, if we assume that thin, pointed teeth must be of the acute hook form, to attain a thin edge. This is not necessary. What the teeth want is an obtuse angle, very stiff, and a short hook point "swaged on" and spread at the same time to form the set. Machines are now made for this purpose and an experienced sawyer when he first sees a saw thus dressed, is convinced without an experiment even. The matter shows on its face that it is practicable and just what is required. Mr. L. O. Orton, of the Berry & Orton Co., at Philadelphia, has experimented a great deal with band-saws, and admits that his attempts to improve machines, while successful and useful, were directed to the wrong point in so far as securing good performance of the saws, and that the difficulties encountered have nearly all been traceable to the form and dress of the teeth, for log-saws especially.

We have examined the saws dressed on the system above described, also the machines for swaging, and are quite sure that with one of these almost any skilled man can "run a band-saw" in timber of any kind.

The most difficult wood to saw with a band-saw is the soft or spongy kinds. The hardness does not so much matter. Georgia or hard pine when seasoned saws very well with band-saws, because the dust is granular, to so call it, and does not pack in the kerf.

In Sacramento, Cal., is a large band-sawing machine for logs, built by Richards, London & Kelley of Philadelphia, for the C. P. R. R. Co., in 1872. The saws are 48 feet long, 5 to 6 inches wide, and the wheels six feet in diameter. This machine has been in successful use for 18 years past.

IMPROVEMENT IN SAND MOLDING PROCESSES.—A company is being started in Glasgow, Scotland, for the purpose of manufacturing improved sand-molding machines, as patented and already introduced, on a limited scale, by Mr. Laeder, foreman molder of the Singer Manufacturing Company's Works at Kilbowie. The invention in question not only accomplishes, without skilled artisans, the work of preparing molds, but while the first cost of the machine is extremely moderate, produces a complete mold in a single machine, and that at a speed not approached in any measure by the aid of skilled labor and such apparatus as has hitherto been available. By the employment of Mr. Laeder's invention, a great saving is effected through dispensing with the use of molding-boxes, the maintenance of which is a considerable item in the working expenses of a large foundry. Over 40 of the patented machines are at present in operation in the foundry of the Singer Manufacturing Company, and it has been found on the average that by their means the cost of producing molds for the castings has been reduced to about one-fourth of what had been formerly incurred, and that in an establishment where every appliance of value has been available for the ordinary process of molding. As the machine is adapted for almost any class of castings of which large numbers are required, it will, in all likelihood, be adopted by the majority of large foundries where light castings are produced.

ORIGIN AND MANUFACTURE OF THE AUGER.—Everybody is familiar with this commonplace but indispensable tool, though not perhaps with the story of its invention and the process of its manufacture. It is said that its principle was first discovered by accident. An Englishman, with the elegant name of Ben Pugh, in the year 1680, was idling away some spare time in watching a boy who was boring a hole in the ground with a piece of iron barrel hoop. As the pliable metal became heated, it twisted its edges and assumed the contour of a corkscrew, and as it was brought to the surface it brought the dirt with it, and combined the boring and emptying business so effectually that Mr. Pugh at once recognized its merit and applied the same principle in boring wood. It has been in use ever since. In the process of manufacture it requires some delicate manipulation and the service of a highly skilled artisan. The iron which forms the spiral part is welded with the steel of which the point is made before forging. It is then put under hammers and forged into shape and is passed into what is technically designated as a "wringing machine," where it is twisted into a spiral form and then introduced to the care of a series of "crimpers," which give uniformity to the twists. This done, the rough and unfinished tool is passed through "straighteners" and made perfectly straight and ready for putting on the head, which is the most delicate and important operation in the manufacture of the anger. The tool is then put through two rubber wheels to rough-polish the twist, when the fitter-up takes it in hand and fits the head and passes it on to the polisher, out of whose hands it passes into the market; and one of the most useful of modern tools preserves the reputation of Benjamin Pugh.—*Age of Steel.*

DELTA METAL.—An alloy of copper, zinc and a small quantity of iron is called delta metal. It possesses the properties of blacksmith's iron, is strong as steel, and of a golden-yellowish color. Toward acid and sea-water it is very resisting, and does not rust, nor does verdigris form on it. According to *Glaser's Annalen*, delta metal is a very old alloy, having been known to the old Egyptians. It was first prepared, however, in a scientific manner by Alexander Dick, a German, in 1882. This metal is an alloy of copper, iron and zinc, resembling aich-metal and sterro-metal, which contain the same elements and are largely used for heavy guns. The delta metal is prepared by taking advantage of the fact that melted zinc will dissolve about 9 per cent of its weight of iron. The saturation point of the zinc depends upon the temperature of the metals during the process—the higher the temperature the greater the amount of iron absorbed. At a white heat, nearly 20 per cent is taken up. The fluid alloy is then mixed with an amount of copper or copper and tin, which varies according to the purpose for which the metal is intended. The oxides present are removed by the addition of a small quantity of manganese, usually in the form of copper manganese alloy.

ENGLISH VS AMERICAN SHIPS.—The experience of the Pacific Mail Company in having its fast ocean steamer China built in Great Britain instead of the United States has not been such as will tend to create a rush to the Old World for vessels. The China made fast time across the Pacific ocean, it is true, beating the Oceanic a little, but she did it at such an expense as has caused no little dissatisfaction to her owners. She carries a few more passengers than the Peking, a 15 year-old American steamer, but the latter can carry about 800 tons more freight, which is quite an item in figuring up the profit and loss of a trip. While the City of Peking, with 4000 tons of freight on board and three boilers at work, makes slightly slower speed, she burns but 47 or 48 tons of coal daily. The China, with but 3000 tons and with a few more passengers than the Peking, burns 80 tons of coal a day and 120 when all six of her boilers are used. This comparison, it must be remembered, is made between a British-built ship whose construction had the advantage of all modern inventions and discoveries and a vessel built in Roach's yard 15 years ago.—*Daily Investigator.*

THE PRIZE ENGINE at the Royal Agricultural Society show of 1849, burned 11½ pounds of coal per horse power per hour; that of 1850, 7½; of 1852 4⅝; of 1853 4½; of 1855 3¾; of 1856, 3½; of 1872 2¾; and of 1887, 1 4 5 pounds per hour.—*Engineering, London.*

IRON BOLTS.—Iron bolts exposed to water, in the bridges over the Thames, have, in 25 years, been eaten away one-half.

SCIENTIFIC PROGRESS.

THE DEEP SEA IS FULL OF WONDERS.—There are fish living 2600 fathoms down, some blind, others almost eyeless, which are so compressed from the weight of the water that when brought to the surface their bodies expand. Three miles down there is no light and no change of temperature. Being no light, there is no vegetable growth, and the fish feed on each other—at least so many of them as have teeth probably do so. Those without teeth, no doubt, feed on animalcule. From Prof. Tait's experiments, it seems that at a depth of six miles the sea is compressed about 620 feet. May this compression long continue, for should it cease, something like 2,000,000 square miles would be inundated. In this connection, it is also interesting to notice that most fish have the habit, at the very first apprehension of danger, of darting rapidly away and of stopping equally quick. They seem to understand that a very few yards will get them beyond the vision of their enemy. The shading of the water varies from blue to greenish. Objects at a depth of 30 feet take a blue tinge, and at from 75 to 90 feet the light is such a deep blue that objects of a red shade appear black. When one returns quickly to the surface with his eyes accustomed to the peculiar under-water bluish light, the aerial landscape, following the laws of contrast of colors, seems reddish. The fact of the blue rays of light penetrating so much farther than those of any other color renders it possible to bring photography to aid the submarine explorer in his investigation as to the real depth that light does succeed in making its way.

A TELEPHONE TO THE SUN.—Mr. Edison is prosecuting an experiment by which he hopes to catch and record the sounds made in the sun's photosphere when solar spots are formed by eruptions beneath its surface. At Ogden, New Jersey, there is a mass of iron ore a mile long standing perpendicular, and extending into the bowels of the earth to great but unknown depths, said to contain several hundred million tons of magnetic material. As the violent storms and uprushes in the sun produce disturbance of the earth's magnetism which are recorded on the magnetometers at the Kew and other observatories, it has occurred to Mr. Edison that the strength of the solar disturbance, as exerted on our planet, could be increased enormously by utilizing a vein of magnetic iron ore, and running around the body of ore several miles of wire, forming an inductive circuit, into which powerful electric currents would be thrown by any disturbance of the earth's magnetism. By the use of instruments every change, he says, could be recorded, and by the use of the telephone all sounds produced on the sun would be heard on our planet. He is, accordingly, erecting telegraph poles on each side of the Ogden ore hill and parallel with it, on which he is coiling an insulated wire many times around the whole area where the earth's magnetic lines leave the iron mountain and extend into space. The two ends of the long wire will be taken into his observation station and connected with the receiving telephone. It is believed that these experiments will materially aid in determining variations of solar heat seriously affecting the earth's meteorology.

COAL DUST AND COLLIERY EXPLOSIONS.—The influence of coal dust in augmenting the force of colliery explosions and in extending the area affected by them is generally admitted to be very great. There are many miners, however, says a contemporary, whose experience and attainments are such as to entitle their opinions to consideration who hold that explosions never originate in an atmosphere composed of ordinary air and coal dust and that some percentage of explosive gas must always be present to start an explosion. Other competent engineers contend, and it seems to be established by the evidence of cases which have occurred, that explosions have originated and extended into other portions of the colliery from shots in stone drifts or tunnels where large quantities of dust were present, and where there was no gas. At all events the amount of dust in the roadways and working-places of a colliery is an element affecting safety which must be taken into consideration and guarded against. When dust and gas are both present, double precautions should be taken.

THE TONGUE AND TASTE.—It is said by medical experts that taste is not equally distributed over the surface of the tongue. There are three distinct regions or tracts, each of which has to perform its own special office or function. The tip of the tongue is concerned mainly with pungent and acid tastes; the middle portion is sensitive chiefly to sweets or bitters, while the back or lower portion confines itself entirely to the flavors of rich, fatty substances. This subdivision of faculties in the tongue makes each piece of food undergo three separate examinations, which must be successively passed before it is admitted into full participation in the human economy.

SIMPLIFYING EXPERIMENTAL SCIENCE.—The *American Engineer*, referring to Hopkins' "Experimental Science" in flattering terms, and naming the subjects treated under the 23 chapters which the work contains, concludes by saying: "Each of these chapters contains beautiful engravings of devices and apparatus, methods and means, that illustrate the instructions. Like the celebrated Faraday, the instruction is conveyed and the experiments described without recourse to mathematics. The majority of students have little taste for the intricacies of numbers and the higher formulæ of mathematics. Most of the apparatus illustrated and described can be constructed and used by any one having ordinary mechanical skill. The work bears the stamp of a thorough scientist, a writer who writes nothing but with certainty of action and result, and of a teacher who imparts scientific information in an attractive and fascinating manner."

THE IMMENSITY OF SPACE.—For a long period astronomers unsuccessfully endeavored, says *Nature*, to determine the distance between the stars and the earth, and it is only within a comparatively short time that the interesting problem can be said to have been solved. The distance which separates us from the nearest star is, according to a recent lecture by Prof. Nichols, about 206,000 times greater than the distance from the earth to the sun, or 95,000,000 of miles multiplied by 206,000. Alpha, in the constellation of the Centaur, is the star nearest the earth; its light occupies three whole years in traversing the distance which separates us from the little blinking orb; or, in other words, should Alpha be blotted out of existence today, we would be well into the summer of 1893 before the inhabitants of this mundane sphere would be aware that Alpha no longer existed. Yet light travels so rapidly as to occupy no perceptible space of time in flashing around our globe. If the sun were transported to the place occupied by this, the nearest star, the vast circular disk, which in morning rises majestically above the horizon, and in evening occupies a considerable time in descending entirely below the same line, would have dimensions puny in their insignificance. Colossal as the sun appears to us, it would, were it possible for it to exchange positions with Alpha, take the Lick telescope to make it appear as a star of the third magnitude.

"FACE PERCEPTION."—By some singular instinct a man who was born blind can tell when he is opposite an object, and can tell whether it is tall or short, slender or bulky. He can also determine whether it be a solitary object or a continuous fence; whether a close fence or an open one, and sometimes whether a wooden fence, a stone wall or a hedge. None of the five senses has anything to do with this perceptive power, but the impressions are made on the skin of the face, and by it transmitted to the brain. He therefore names this unrecognized sense "facial perception." The presence of fog interferes with facial perception, and makes the impressions faint and untrustworthy, but darkness is no impediment. A noise which distracts the attention interferes with the impressions. In passing along the street he can distinguish shops from private houses, doors from windows, and whether the windows consist of a number of panes or of a single sheet of glass.

OILING THE HURRICANES.—The ship Timandra recently arrived at New York from Calcutta after experiencing a series of most terrific hurricanes. She encountered no less than four during the passage. According to the N. Y. *Times*, she met the first July let near the Mozambique channel and lay in it 18 hours; the second was on the following evening and lasted 16 hours; the third, and worst, was July 24th, and lasted for eight hours; and the fourth came along July 31st, just off the Cape of Good Hope, and kept up for 32 hours. Capt. Mowatt, during this quartette of gales, hung oil bags over the bow, amidships and astern, and rode them all without injuring his vessel in the least. He is now enthusiastic over the oil idea.

A LOST COMET FOUND.—Some three weeks ago, Prof. Barnard of the Lick Observatory discovered what he at the time supposed was a new comet, which then occupied a space in the heavens near to the planet Mars. Since that time, computations have rendered it probable that it is the lost comet d'Arrest, which was last seen in 1877, and its return predicted in 1883. It did not then make its appearance, probably was overlooked, as it was only a telescopic comet. From computations of the two they now appear to be one and the same.

FIRE FROM STEAM PIPES.—In an article on the danger of fire from steam pipes in a German paper, it is said that after wood has remained a long time in contact with steam, hot water or hot air pipes, the surface becomes carbonized, and during warm weather the charcoal absorbs moisture. When the moisture is driven off, it leaves a vacuum into which the fresh-air current, circulating around the pipes, rapidly penetrates and imparts its oxygen to the charcoal, causing a gradual heating and eventually combustion.

THE NEW ALLOY, discovered by Keith of Birkenheim, Germany, is claimed to practically resist the attacks of most acids and alkaline solutions, and may therefore be very advantageously used in the laboratory to replace vessels of ebonite, vulcanite or porcelain. It is composed of 15 parts copper, 2.34 parts tin, 1.82 parts lead, and one part antimony.

IMPROVING THE PHONOGRAPH.—Mr. Edison has succeeded in improving the phonograph so that it can be worked by a water motor as well as electricity.

GOOD HEALTH.

a ı nd Cataracts.

EDITORS PRESS:—I have an idea; something I fr¤quently haven't got. I see in the newspapers that dreadest of all dread epidemics—the Asiatic Cholera—is heavy in the Islands of Japan, and that it may come in a ship to California one of these days,

Now in the trough, or valley, of the Ohio river is the City of Wheeling, and in that city I was born (so I've been told), and also, I was reared to some degree of manhood in that place, and as it is of pious record that I have been upon this earth for about threescore years, it stands to reason that I must have seen something of the cholera; for that disease has been in these United States several times since I came, and it about always strikes hard upon the line of the Ohio river.

When I was a boy the disease swept my native city furiously, and since then it has hit it pretty hard again and again, but at none of these times, or, as I think, at any time, has this disease prevailed in Zanesville, Ohio, 87 miles west of Wheeling on the Muskingum river, a branch of the Ohio.

During a heavy attack of the epidemic in Wheeling a vigorous young physician of Zanesville volunteered and went to Wheeling to study the great destroyer, and having soon died there of the disease, his body was taken to Zanesville and buried, but there were no cases succeeding his funeral. I have often, while I resided in Zanesville for ten years subsequent to 1852, wondered and pondered why there was none of this disease there when it struck Wheeling again during the fifties. The soil about the two cities is similar, the products the same, the surface hilly, the people's habits and housings alike, the fuel bituminous coal for both, the "breed" of the people from a like stock, morals, religion, education, and amusements nearly related; the trees, rocks and climate are not different. What then is it which preserves Zanesville from cholera and punishes Wheeling? The Ohio river moves "on its clear winding way toward the sea" with steady, even, strong current as it glides past Wheeling, leaving no stagnant water; while the Muskingum tumbles and whirls over rocks and rapids as it gurgles onward passing the whole length of Zanesville.

I have an idea that the rapids in the river at Zanesville have something to do with her exemption from the rapid disease. That the *microbes, bacilli, whoodle bugs or what-ye-may-call'ems* cannot stand the racket and the roar of pure, fresh water in large quantity. Large quantity, because the Muskingum is a stream larger than the San Joaquin, and, except in spring flood, its water is clear as a diamond. I have no knowledge of how the Asiatic terror acts, if at all, around Niagara Falls or other rapids of water, but the PRESS can inquire about this matter and find out, and perhaps it may be that rapid rolling waters are remedial or preventive when the cholera comes around.

I am about satisfied that water has a great deal to do, not only with cholera, but with several other epidemic diseases. Water of any kind is a dangerous fluid, anyhow. I've sampled it several times.

If we find that waterfalls are efficacious as against the invasion, we have only to "flee unto the mountains" up stream, and squat.

Let us all hope and the pious pray that the pestilent plague may keep away. In the mean time—yours, J. W. GALLY.

Pajaro Volley. Oct 22d.

ELECTRICAL TREATMENT.—The passage of a current of electricity through the body may benefit the system by agitating, and perhaps decomposing, certain portions of the tissue. A little electricity, however, goes a great way in this regard. Physicians, in giving this sort of treatment, use only from one to five one-thousandths of an ampere. From one to three amperes, passed through the vital parts of the human system, would be positively dangerous, for the tissues cannot stand so violent an agitation. In order to force this volume of electricity through one's system, a pressure of several hundreds of volts is necessary, owing to the resistance of the body.—*Ex.*

DISINFECTING CANDLES.—Of late, says the *Scientific American*, owing to its proved germicidic power, the vapor of bromine has come to the front as a disinfectant. Hygienic iodine lights and candles, which on burning liberate iodine vapor in any required quantity in the same manner as the bromine night lights liberate bromine, and which are made in a similar way, promise to render considerable service in the treatment of throat and chest complaints. They are, in fact, the first means introduced of successfully dispersing a gentle and regular flow of the vapor of iodine through the air of a room.

ANTI-PYRENE AND THE OPIUM HABIT.—One cause assigned by several physicians and druggists for the increasing number of victims to the opium habit is the use of anti-pyrene. A great number of young women, especially female clerks, take anti-pyrene in such quantities that it finally loses its restorative power. They then resort to morphine.

BACTERIA IN THE AIR.—A writer in *Science* says that while as yet we have discovered no way of avoiding contagion which comes to us in the air, we are just beginning to find out the extremely important fact that the air does not become contaminated with bacteria unless they are allowed to dry. Recent investigations, he adds, have shown a smaller number of bacteria in the air of a well-kept sewer than in that of a poorly ventilated schoolroom.

USEFUL INFORMATION.

HOW TO PILE HARDWOOD.—To know exactly how to pile hardwoods to secure quick results and prevent checks, stains and mold is more of a science, says the *Timberman*, than most people imagine. For instance, oak, ash, hickory and other tough woods must dry very slowly, and therefore when piled must be crossed with very thin sticks, placed closely together, in order to get it to dry as slowly as possible. The softwoods, like basswood, pine and poplar, dry more rapidly, and there is not so much danger of checking. No hardwood pile should be more than six or eight feet wide. The front part of the foundation should be at least two feet from the ground, the back about 18 inches. A space of at least two feet should be left between the piles. Begin the pile by leaving a space between each board, and continue to do so until the top is reached. Place the cross-sticks about four feet apart and directly over each other. Put the sap-boards with the sap down, and on the outside of the pile. Cross-sticks should never be more than three inches wide and thoroughly dry, and the front stick should be placed so as to project about an inch beyond the ends of the lumber. This allows just enough moisture to collect to prevent the stock drying too rapidly on the ends, or faster than other portions of the pile. When a pile is completed, the top should be covered in a substantial manner to protect the lumber from the rain and sun. This covering should project beyond each end of the pile and also over each side.

WHY DIAMONDS SPARKLE.—Many persons have been puzzled to account for the ceaseless motion of diamonds in the earrings worn by ladies. It makes no difference that the head of the wearer is in perfect repose and that she is speechless, the twinkling goes on, greatly enhancing the flashing beauty of the gem. The secret of this motion is in the setting of the diamond, and the method is patented. The patentee is rearing a royalty of $50 from every manufacturing jeweler to whom he sells the privilege of using it. The stone is set in the usual manner, except that a band like the handle of a diminutive basket is attached to the framework. On the other side of the band is a duplike cavity. On the lower part of the hoop is a pin, pointed with rhodium—a metal that never wears out—something like the iridium with which gold pens are tipped. When the diamonds are put into position on the hoop the rhodium point projects into the cup. The result is what scientists call a condition of unstable equilibrium. Like the pea blown with a pipe by a schoolboy, the diamond is given no rest, with the difference that no effort is required to keep it dancing.—*Jeweler's Weekly.*

A MACHINE FOR LAND CLEARING has been devised, which, without the expenditure of great force, accomplishes a vast amount of work in a short space of time, and with a degree of thoroughness hitherto unattained by mechanism for such a purpose, this being due to the peculiar construction of the device, which is in the form of a capstan. Around the drum of the capstan a heavy cable winds, the other end being attached by means of a heavy chain to the object to be removed. This cable is 160 feet in length and by means of a block of special adaptation, any part of it can be hitched, as desired. The shaft which turns the drum is 15 feet in length, and is drawn with entire ease by one horse. Dividing the length of the shaft by half the diameter of the drum, five inches, it gives the multiplying power of the machine as 36, and by means of another block the power of the machine is increased to 72 times that of the horse which turns the shaft.

TO PREVENT THE BREAKAGE OF MINING TIMBERS.—A German mining paper says that to prevent the premature breaking of the wall-props, the Consolidated Mining Co. in the district of Aachen has, after experimenting for some time, found that when three or four notches, 30 centimeters deep, have been sawed in the top part of the wood, this yields to the pressure by being compressed, but does not break. The economy in the item of timber has not yet found an expression in figures.

TO CLEAN IRON PARTS OF MACHINERY, tools, etc., two to three cents' worth of paraffine chipped fine are added to one liter petroleum in a stoppered bottle, and during two or three days from time to time shaken up until the paraffine is dissolved. To apply it, the mixture is well shaken, spread upon the metal to be cleaned by means of a woolen rag or brush, and on the following day rubbed off with a dry woolen rag.

JAPANESE PAPER.—Speaking of Japanese paper, the London *Daily News* says: Toughness and a silk-like surface are the usual characteristics of Japanese paper, which, in spite of our recent progress in this department of the arts, still remains far superior to European paper.

ELECTRICITY.

PROGRESS IN ELECTRICITY.—A noted astronomer once said that it was a moral impossibility for one man to keep abreast of the science of astronomy. Indeed, said he, individuals find enough to do in devoting their attention to one subject like Mars, the sun or the moon, and following it for a lifetime. The same truth certainly applies to physics, and more particularly to the subject of electricity. To say nothing about the purely scientific side of the question, no man can adequately study the advancement which is being made in the application of electricity to the mechanical arts. Not a week and hardly a day passes without some new invention to utilize this subtle power. Huge dynamos, new insulators, improved conductors, giant machinery and fairy-like contrivances, are some of the results which mechanical skill is constantly turning out in this steadily widening and fertile field of invention. And, indeed, the marvelous adaptation of this new agent to the practical ends of life even transcends the development of the steam engine. Nor will it be strange if the lightning does not make a greater revolution in mechanics than the tea-kettle did after that happy experiment of James Watt. Inventors are already feeling their way into the employment of electricity as a motive-power on a large scale, and it would appear that the world is at the threshold of some daring experiment, which shall eventually overturn existing ideas as to the limits of mechanical force.

ELECTRICITY IN THE PRINTING OFFICE.—A new use for electricity has been found at the Cook publishing house. In the office of the superintendent ten electric lamps are arranged in separate compartments of a frame or box, somewhat similar in appearance to the annunciators seen in hotel offices. The lamps are concealed from view, apertures in front of the compartments being covered with colored glass, each having its distinguishing color. The lamps are connected by means of electric wires with the automatic counting machines on the ten large printing presses located in an adjoining building. When the presses are in operation, the electric circuit is opened and closed by the working of the counting machines, causing quick flashes of light in the lamps. Thus every sheet of paper printed in the establishment telegraphs its record to the office, where the operation of each machine can be seen and its speed or delays noted. It is believed that this is the first application of electricity to purposes of this kind, and may serve as a valuable hint to managers of large establishments who wish to be enabled to see the operation of their machinery while working at their desks.—*Elgin, Ill., Daily News.*

ELECTRIC SAFETY DEVICES.—With our constantly increasing knowledge of the character and proper mode of handling electric wires, their danger is rapidly passing away. The great number of electric safety devices that are being brought out show that considerable attention is being given to the safety of circuits and apparatus, as well as securing the safety of the public. Automatic protectors for circuits and machines as well as lightning arresters are multiplying very rapidly. Ground detectors which automatically indicate a leakage from the circuits are in use and work most perfectly. In connection with these, means are employed by which the leak may be easily located. The successful working of all these devices has greatly increased the safety of high tension circuits, so that of late but few accidents have occurred. There is one underground circuit in Chicago carrying a potential of more than 4000 volts, and less trouble is experienced from this circuit than from some others carrying a potential less than half this amount.

GENERATION OF ELECTRICITY BY THE FLOW OF THE TIDE.—A French engineer, M. Decoeur, has elaborated a project by which he proposes to supply electric power to Paris. He would generate the required electricity by utilizing the flow of the ebb and flow on the coast and transmitting it to the French capital. There seems to be no reason why the scheme should not prove a practical one. If it should prove practical at the French capital at such a distance from the seacoast, it would be found much more practical in cities directly upon the coast. Why may not every such city be lighted by the tides, while incorporated companies are employing the same agent for the distribution of power? The wind and tides will ere long be pressed into the service of man in many ways.

ELECTRIC WELDING.—It would appear from the president's address at the late meeting of the British Association for the Advancement of Science that the principle of electric welding was publicly shown by Sir William Siemens, on a small scale, some years before the experiments of Prof. Elihu Thompson gave it its present world-wide reputation and value by his more thorough and practical demonstrations.

DEFECTIVE ELECTRICAL APPARATUS.—The New England Insurance Exchange employs an electric inspector whose duty it is to report to the secretary such electrical apparatus as he finds is not installed in accordance with the rules of the exchange. The secretary is also required to notify both the assured and the party installing the apparatus of all defects; and if, at the expiration of 30 days from such notice, such defects have been remedied, the rate on both building and contents will be advanced at least ten cents, and the new rates duly promulgated by the company's agent.

THE BUILDER.

About Fireproof Buildings.

Charles F. Andrews, a Boston architect, who has recently been visiting New York to study in that city the question of how to render city buildings better proof against fire than any plan now in use, says:

"We folks in Boston were led to believe that some of our builders had solved the secret of how to make buildings fireproof. At the last great fire in our city we learned how little confidence could be placed in these claims. Of course it is generally known that many of our streets are very narrow, and at the last conflagration the result of this narrowness was that structures on the opposite side of the street to that on which the flames were holding revel absolutely crumbled from the intense heat. Some of them were supposed to be fireproof buildings. The more I investigate the matter, the more confirmed becomes my belief that in the presence of a very hot fire nothing now built can stand. New York people had an illustration of the devouring power of fire in the case of the Western Union building. It was called a fireproof building, but when the flames took possession of it they had things almost all their own way. You have in New York a number of buildings that are calculated to present the maximum resistance to a fire started within them, but I doubt if they would stand before a general conflagration. After careful study on this important subject, I have come to the conclusion that the only safety to large buildings in case of fire can be found in the provision of water-tanks of ample size. I notice that in New York all the so called fireproof buildings that are in course of construction have immense reservoirs on almost every floor. In case a fire breaks out, the contents of these tanks may be let free and any conflagration drowned out. I do not believe we have yet solved the problem how to make buildings fireproof, but I have so much confidence in American ingenuity that I believe it is only a matter of time when we shall learn how to erect structures that will be able to defy any conflagration, however hot it may be."

There seems to be a pretty general agreement in the opinion that a genuine fireproof building is something which has not yet been devised, but still the possibility is considered within the skill of our architects, the only hindrance to its realization being the prevailing vice of American life—the haste to get rich and the grudging of a little money to provide against some possibly remote contingency.

ESTHETICS IN HOUSE FINISHING.—More thought, says the *Architect*, has been given at different periods of civilization to the obtaining of esthetic effects for the interior of residences than, perhaps, any other matter in the history and evolution of architecture, and in our sunny California it is interesting to note the growth of refined taste to which so many of our architects are now called upon to cater. Our State, we consider, is as remarkable for its architectural growth as it is for the enterprise and liberality of our many millionaires. It is suggestive to the ambitious designer, that here in the far West, the elegant portiere has within a decade or so supplanted the miner's gunny-sack which once draped the openings of his mountain castle, and that the elegant "modern residence" of the Queen Anne, or other type, has taken the place of the "candle-box" style which was once the pride of the "contracting architect, shingler and builder" who furnished "plans," etc., for *glory*, and made the rattle-trap thing cost in extras and repairs twice the amount of his original contract. It is encouraging to note architectural advancement made in residences and business structures in both city and country, and also a real growing demand for the many modern features which go to make the American home beautiful—"a joy forever."

CALIFORNIA VENEERS.—California and the Pacific Coast is noted throughout the world for its wonderful productions, and not the least of these are the ornamental woods suitable for the most delicate effects of the artistic designer in fancy woods, wherever he may be found, whether in the countries of the New or Old World. Their beauty is appreciable by all; from the savage to the most cultivated esthetic taste, their rich tones and ever-changing shades cannot fail to bring exclamations of approval. If the wonderful Aladdin was now to build his palace, the expert sprites would certainly procure their fancy woods from this part of the world. The *California Architect*, from which paper we clip the above, very properly adds: In view of the above, it seems astonishing that Eastern architects, designers and manufacturers of artistic woodwork should be so slow to look into the adaptability and beauty of our Pacific Coast woods.

RESISTANCE OF BRICK.—Recent experiments to test the strength of brick resulted in demonstrating a crushing resistance of from 5000 to 20,000 pounds per square inch, according to the quality of the brick.

Passing Events.

The balcyon days continue on the Pacific Coast and ont over the great South Sea that softly laves the shores of this far Southwest, the weather here being in sharp contrast with that which obtains on the Atlantic side of the continent, where the destructive tornado sweeps alike the land and the ocean. This California climate of ours should seem to the whole world a standing invitation to come here and enjoy safety and peace.

The labor troubles, that little distnrb here, continue and spread among peoples abroad. They encircle the world. In Australia, British Columbia and Canada, all over the Eastern States; in Great Britain, France, Belgium and Germany, the laborer and the employer stand arrayed against each other to the great detriment of both. A dark winter impends, admonishing a settlement of the difficulties that so distract the industrial world.

Mining for the precious metals is being well prospered throughout the Pacific States and Territories, Mexico and British Columbia included. In Australia, however, the industry is being much crippled through labor strikes, which affect every branch of the business, gold, copper and coal-mining alike. Operations in even the great Broken Hills mine have, through this cause, been brought to a standstill. This alone implies a loss of more than half a million per month, a large percentage of which falls on the wage-earner. This obstruction of the mining industry will materially reduce the output of gold, coal and copper in that country this year.

The difficulties that for a time beset the Commissioners of the Columbian Fair having been disposed of, the enterprise seems to be sailing in smoother waters, though a new trouble appears to menace its success in the threatened refusal of Italy and other European nations to be represented at the great exposition because of the enactment of our late tariff law. The better way, it strikes us, would be for the parties aggrieved to retaliate in kind.

The potato blight that has fallen on large sections of Ireland seems likely to be supplemented by an unusually short crop in this country as well. Murders, assassinations and suicides grow apace, filling the mind of the humanitarian with apprehensions as to the future of the race. As regards the frantic exhibitions of patriotism incident to the political canvass now in progress, these philanthropists are not so deeply distressed, seeing in the results of the impending election a cure for the malady.

A Great Convocation of Workers, Thinkers and Inventors.

Mr. Charles G. Yale, associate editor of this paper, who took his departure East on the 28th Sept. with the purpose of meeting in conference the various bodies, British, German and American, interested in the manufacture of iron and steel, and of visiting later on the great coal, iron and petroleum districts of Pennsylvania and regions adjacent, writes us giving a detailed account of his experiences since leaving California. We can at this time give no more than a synopsis of what our associate has to say in the above connection, and a more full account of which will hereafter appear in the columns of the PRESS.

The party of home and foreign engineers, which alone consisted of 600 persons, left New York on the 11th instant by two special trains over the Pennsylvania railroad. Reaching Philadelphia, this party visited first most of the great industrial establishments in and about that city. Then the Edgemoor Iron Works, 30 miles below on the Delaware, were seen. Next the Schuylkill valley, with its coal and iron, and its more notable manufacturing centers, was visited. This accomplished, the party having meantime been joined by the representatives of the Ironmasters of England, Germany and the United States, the vast concourse moved west, taking in the Johnstown district, the site of the late disastrous floods, also the Monongahela and other oil-producing sections, reaching finally the smoke-begrimed city of Pittsburg, with its forges, furnaces and foundries, its machine-shops and factories, infinite in variety and vast in extent.

Among the guests present were most of the iron magnates of our own and other countries. Conspicuous among the number were Sir Lowthian Bell, Sir James Kitson and Sir Nathaniel Barnaby, Englishmen; also Herr Alex. Thielen, president of the German Iron Verein, together with our own Andrew Carnegie, Abram S. Hewitt, John H. Ricketson, Rossiter W. Raymond, George W. Maynard and many other untitled noblemen, citizens of these United States. Never before was there gathered anywhere, or on any occasion, so much science, skill, and practical talent, as at this great convocation of workers, thinkers and inventors; nor can we hope soon to see another such gathering either here or elsewhere.

A Voice from the Mountains.

At the Joint Assembly Convention held at Sierraville on the 29th ult., it was determined that the Boards of Supervisors ought to be empowered to impose a license tax on sheep brought in to graze in the mountain counties; it was also expressed, as the sense of the meeting, that the hydraulic mines in Sierra and Plumas counties, being distant some 200 miles from Marysville, the amount of debris carried down that far could cause no appreciable damage to the farming lands or to any other interest; wherefore, the continued suppression of that industry in these counties ought to be deemed unjust and inexpedient. It is expected that Mr. F. G. Hail, nominee for the Assembly from that district, will, if elected, exert himself to carry out the views of the convention as above set forth.

The New Phase of Suicide.

Whence Comes It and What Does It Tend To?

Cyrus W. Field, the New York millionaire, having erected in that city a very tall building, one of his sons going to the top and passing out on a platform protected only by a railing, was seized with a sudden impulse to jump over, and would have done so had not a person present grasped him by the arm and prevented his taking the fatal leap.

This tendency to commit suicide under the influence of a momentary impulse, though not always under circumstances precisely like those above related, is becoming alarmingly prevalent, more especially in this country. With some, the rushing by of a locomotive becomes the incentive to self-destruction. Others cannot trust themselves to look over the side of a steamer, to such an extent does the sight of the water incite in them a desire to jump overboard, while still another class when climbing a high ladder or clinging to a rope are actuated by an irresistible impulse to let go their hold.

And this proneness to self-immolation is clearly on the increase. Indeed, it would appear to be of comparatively recent origin, there being little or no evidence of its existence in former times. As yet neither our doctors, our psychologists nor our clergy have been able to explain whence it comes or to divine what it means. That it is the product of our modern civilization there is good reason to believe, since among less enlightened peoples it does not much obtain.

True, suicide, pure and simple, is practiced everywhere. But its victims are moved thereto by causes and motives that are easily defined and well understood. Not so, however, with this new mental malady, which, coming without warning or any known cause, proves a stumbling-block to those whose business it is to minister to the mind diseased.

In searching after the origin of this inscrutable soul-sickness, it may be well to look a little below the surface. Excessive culture, as we all know, is a prolific breeder of disease. The wild-grape vine, unpruned and uncared for, has a long and healthful life, whereas the cultivated vine is short-lived and sickly, the same being measurably true of all other cultivated fruits. Is it much different with the human race? The uncultured savage has few comforts and no luxuries. He is ignorant of the many pleasures enjoyed by civilized man; but then he knows just as little of the social evils and the mental disorders with which the latter is afflicted, leaving it a question which is the better off.

Should this new madness much increase, as the vices and the infirmities of a high civilization are apt to do, it will be calculated to incite the gravest apprehensions. If it has come to stay and to spread, the fact becomes fearfully suggestive. This style of self-murder, as before observed, is becoming every year more and more common. The number of these crimes, or casualties, if the reader so prefer to call them, has, during the present generation, been more than doubled. The fool-killer having been off his beat for a very long time, the mentally unsound have multiplied at an alarming rate, and if for this hallucination there shall be found no cure, we may expect that it will hereafter take on still other forms, developing, perhaps, phases yet unheard of. That its manifestations will be confined to cases of the kind we have enumerated is too much to hope for. That the spell will come over these unfortunates on other occasions and under other circumstances than those before mentioned may well be supposed. There is room for this malady to expand in various directions—in the direction of the knife and the pistol; also, of the deadly potion, which latter having been attained to "rough on rats," may no longer be left standing around carelessly.

There is, in fact, a chance that this practice of self-immolation will yet grow into a fashionable pastime—possibly an uncontrollable craze. The day may come when the rich and the aristocratic, the over-cultured and the aesthetic, will consider this the proper thing to do; when we shall find of a morning the courtly lady standing on her head in a tub of cold water, the attenuated legs awry and the nether garments reversed in an unseemly manner; when the deeply-read cook will seek to roast her person by crawling into an over-heated oven or by seating herself on a red-hot stove; when, through this jumping-off process, the bodies of the distraught shall accumulate in heaps about the tall buildings, with some increment, of course, during *leap* years and, finally, when the average policeman, worrying over the low state of religion, shall club himself to death and the dude strut his life out under the impression that he is a turkey gobbler.

The time may come, we say, when the victims of this false and forced civilization of ours, aweary of life, will have recourse to these and possibly other expedients for getting rid of it. The contingency is not a pleasant one to contemplate, though it must be confessed there is a glimmer of sense in one so demented, seeking to butt or blow out his brains; and who shall say that this mysterious and inexplicable madness, which so subverts the first law of Nature, is not the beginning of the end? When the instinct of self-preservation shall come to be largely extinguished, the time will be not far off when the experimenter with man on this planet will feel constrained to pronounce that experiment a failure.

Only What Was Expected.

The price of silver in this country has, during the past month, declined 25 per cent, caused by overspeculation in this metal and by a determined effort on the part of the monometallists to frustrate the measures taken by Congress looking to the partial rehabilitation of silver. This is no more than was expected. The failure of this effort to disparage the white metal shows, however, the futility of attempts of this kind, nor is it probable that the speculators, after the experience they have had, will care to again load up with silver in the hope that they will be able to corner the market. To make impossible speculations of this kind and put an end to this war on the white metal, all that is required is to admit it to free coinage, after which it will take care of itself. As long as it remains, as at present, even partially ostracised, we shall experience more or less trouble in our attempts to adapt silver to the ever-fluctuating conditions of the financial and commercial work. Let its ancient functions be restored and thus an end be put to all this pother about silver.

The speculative movement in silver inaugurated in this country having inspired a general belief that it would advance the price of that metal to extreme figures, large shipments were made, arriving here from every quarter. These hopes failing to materialize, the price of the commodity naturally tumbled in the manner we have seen and to the serious loss of those interested in maintaining inflated figures. This decline was not due to any overproduction of silver such as its enemies predicted would follow the late legislation in its favor, nor is it likely that any such overproduction will take place.

The Director of the Mint, who enjoys exceptionally good opportunities for studying this question and forming a correct judgment in regard to it, expresses the opinion that no such result need be apprehended, for the reason that there has occurred of late no appreciable increment in the output of our silver mines, though the enactment of the late congressional bill has tended to stimulate that industry. If new ore deposits are being discovered and the mines are being worked a little more vigorously, the old deposits are being exhausted, while the winter season, now at hand, will tend to diminish production.

Even though the product of silver should be considerably enlarged, it will no more than keep pace with the growth of our other industries, which, being extremely rapid, call for a corresponding increase in the circulating medium. The expansion of silver mining in other countries, so confidently expected, has not taken place. Mexico has silver mines, but the output remains as before, the same being true of South America, Australia and Russia, in which last-named country the product of the white metal is comparatively small, though it is known to contain extensive deposits of lead-silver ore. But this ore is generally low-grade, these deposits being in other respects unfavorably conditioned for large and profitable production. An excessive output of silver is not therefore to be apprehended.

Salt-Making Processes.

NUMBER III. - CONCLUDED.

The Kanawha or Pomeroy Method.

Although this process has been in operation for some 40 years, it has so much to recommend it, and the evaporative power of the fuel is so fully realized, that it has seemed advisable to give some account of it; for in principle it is available not only in salt-making, but also in other branches of chemical manufacture where the economical evaporation of large amounts of dilute solutions, together with fractional crystallization, is a desideratum.

For the description and the data from which the accompanying plan has been made (Fig. 3) Mr. Chatard is indebted to Mr. John J. Juhler of Pomeroy, Ohio. The dimensions and details of operation are taken from his White Rock Furnace, and represent typical works carefully run and giving results stated by other manufacturers to be among the very best.

The characteristics of what may be called the Ohio region are cheap fuel and weak brines which, though very impure, are nevertheless practically free from gypsum. The principle of the method is the boiling of the brine in a steam chest by which a portion of the impurities is rendered insoluble, and a large supply of low-pressure steam is utilized in the evaporation of the brine. The grainers are arranged at different levels so that the mother liquors can be drawn from one to the other, giving a series of products of which the early ones are ready for the market, the later being redissolved in the settlers. The process is thus practically a continuous one.

The brine is pumped into a large tank and flows through a trough in which it is heated by steam pipes and conveyed to the front of the furnace, where it enters the first division of the steam chest. The steam chest in which the brine is boiled is in three divisions, connected by copper pipe. Each division has a cast-iron bottom one inch thick, made by placing together side by side 11 pans, each 10 feet long and 3 feet wide, having ends 12 inches deep and sides 8 inches deep, except the two end pans, which have each one side (the end side) 12 inches deep. By bolting these pans together we have a single pan 33 feet long, 10 feet wide and 12 inches deep, having divisions 8 inches high running across it every 3 feet. The seams of the divisions are thoroughly calked.

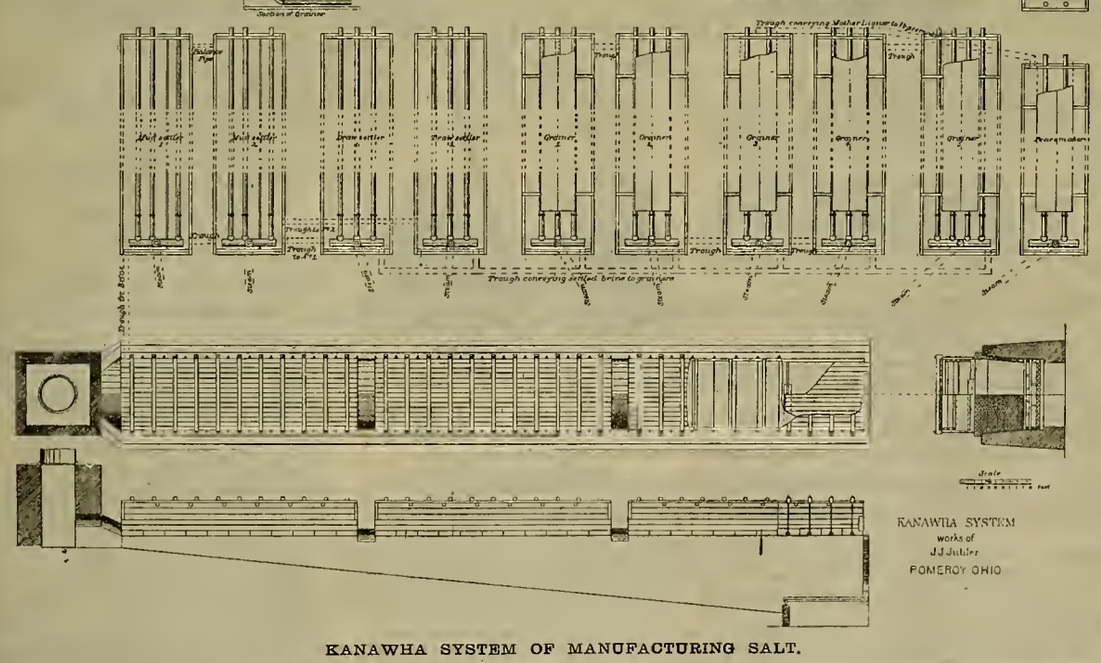
Resting on the divisions and bolted to the inside of the side-plates is the side-planking, 4 inches thick and 4 feet high, the seams being horizontal. The ends of the steam chest are formed by bolting to the outside of each of the end sides of the pan the so-called "damper," a cast-iron plate 1 inch thick and 2 feet high, having sides which extend back about 8 inches on the outside of side-planking; the remaining portion of the ends is filled out with 4-inch planking bolted to the inside of upper edge of damper and grooved into the ends of side-planking. Across the top of the tank so formed are six iron joists, let in flush with the upper edge, on which the top planks, also 4 inches thick, are laid.

In the steam-chest the brine is boiled till it reaches 15° to 18° B., depending upon the needs of the grainers for brine, the steam pressure carried being about four pounds. The brine, deeply colored by suspended oxide of iron, is then drawn off and flows into the first mud settler, reaching it on the upper side of the water-tight central partition; passes to the farther end, then through a low place cut in the top of the partition back to the head of the settler, whence it goes to the second mud settler to make the same round. By this time the iron mud is deposited and the brine, already much concentrated, flows to the first or the second "draw settler," as needed, where it concentrates until ready to deposit salt, unless the grainers require it before it reaches that point, which is 23° B. (sp. gr. 1.178). From the draw settlers it goes to grainers 1 and 5, where it deposits the best salt. When the brine in No. 1 attains 24° to 25° B., it is drawn into No. 2, while that in No. 5 reaches 26° to 27° B., and then goes to No. 4. Nos. 2 and 4 give a quality of salt but little inferior to that of Nos. 1 and 5.

The mother liquor of No. 2 and No. 4 goes at 29° B. to No. 3, where, still depositing salt, though of an inferior kind (No. 2), it reaches 31° B., when it is drawn into the "peacemaker" or smaller grainer, where it concentrates to 34° to 35° B., being then transferred to a "bitter water cistern" and rising to 37° B. In each of these some salt is deposited; but it is so impure that it is redissolved in the first mud settler. The heavy mother liquor is now ready for the bromine works, where it is distilled with sulphuric acid and chlorate of potash, yielding, when properly managed, about one pound of bromine for every two barrels of salt made.

The residue of the bromine distillation is then neutralized with lime and evaporated. It deposits some agricultural salt, and the hot liquid, consisting mainly of chlorides of calcium and magnesium, is run into oil barrels, solidifies on cooling, and is sold, being employed for making the non-freezing liquid of the Pictet ice-making process.

The settlers and grainers, with the exception of the "peacemaker," are each 180 feet long and made of 4-inch lumber, pine or poplar, preferably the latter. The steam connections are all of wood, being made of pine or poplar logs with a 6 inch bore, the copper pipes being five inches in diameter, 3 16 of an inch thick, connected by gooseknecks to the headlogs at upper end of grainers and passing through the lower end. The condensed water runs to waste, experience having shown that no further benefit can be derived from the small amount of heat thus lost. The absence of sulphate of lime, one of the most important points connected with this brine, permits the use of the light copper pipe, to which, in great measure, the high evaporative result is due.

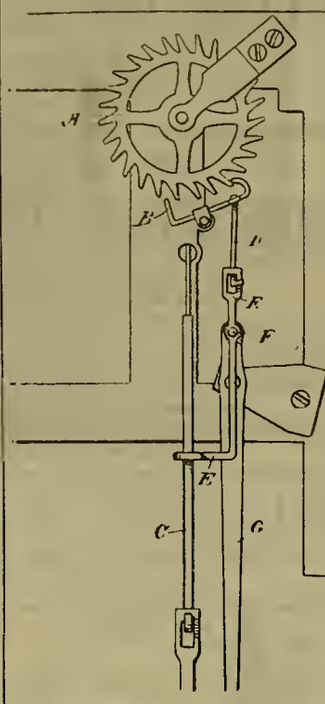


KANAWHA SYSTEM OF MANUFACTURING SALT.

Verge-Wire for Clocks.

The accompanying cut illustrates the invention of James M. Miller of Vacaville, Cal., which he has secured by letters patent of the U. S., No. 438,355, dated Oct. 14, 1890.

Every one knows how essential it is to have



VERGE-WIRE FOR CLOCKS.

a clock in even heat. A clock may be properly adjusted in this respect when it leaves the dealer's, but if the owner in mounting it does not get it on a level shelf, it will be out of beat, and the consequence will be that the verge will fail to properly engage the escape-wheel and the clock will soon stop.

While it is an easy matter for a clock-maker or repairer to readjust the verge to suit any given location of the clock, it is not easy for the owner to do so, even though he knows enough to bend the verge-wire. The invention of Mr. Miller, however, provides a very simple and readily operative means for enabling any one to properly adjust his clock to an even beat no matter whether it be on a level shelf or not. This device will be readily understood from the cut. The usual parts of the clock are the escape-wheel *A*, verge *B* and pendulum wire *C*.

The customary verge-wire consists of a single piece attached at its top to the verge, and bending about the pendulum wire at its lower end. Now any adjustment of this wire will adjust the verge, and the usual adjustment is effected by bending the wire; but this is a somewhat difficult operation for an inexperienced person, as he can get it to the proper point only after repeated trials. In Mr. Miller's invention, the verge-wire is divided into two sections, the upper one *D*, and the lower one *E*. The former is connected with the verge, and the latter with the pendulum wire, and the two are jointed together at their adjacent ends. The lower one near its top is pivoted at the point *F* to the upper end of a pivoted lever *G*, the lower end of which extends downwardly within easy reach. Now when the clock is out of beat, by turning the lever to one side or the other, as may be needed, and thereby shifting the fulcrum *F* of the verge-wire, the sections of said wire are slightly changed in position and made to conform to the position and throw of the pendulum wire, while keeping the verge itself in proper position to be operated by the escape-wheel.

African Gold-Fields.

In a paper read before the American Institute of Mining Engineers by W. H. Furlonge of Johannesburg, "On the Geology of the De Kaap Transvaal Gold-Fields," he says that here, as in other gold-mining countries, are found large granitic areas and belts, flanked by schistose and shaly rocks, which contain auriferous quartz veins. Decayed granite also often covers immense tracts. The town of Barberton is built on the eastern edge of one of them, which is at least 16 by 18 miles in extent. A striking feature throughout the large areas is what are locally known as "dongas." They are merely water-washes in the decomposed rock, are often of great extent and depth (the latter reaching 200 feet), and sometimes present the most fantastic and picturesque appearances. The accompanying engraving is given of one of the more striking. The rock seen is entirely decayed granite, which is on a "flat" and in a natural drainage channel; while the hills in the background are composed of the same rock, but in a normal or solid condition. The fragments that have rolled down the hill on to the "flat," and which have been subjected only to the ordinary atmospheric action, are also undecayed.

The Mechanics' Institute Fair.

The annual fair of the Mechanics' Institute, which closed one week ago to-day, though well attended, was not quite so successful in a financial point of view as that of last year, the net profits realized this year having amounted to $25,000 against $30,000 the preceding year. But despite this falling off in net revenue, the late exhibition was in all respects equal if not superior to any of its predecessors, nor was it less appreciated by the multitudes who attended it. The premiums awarded were numerous, and, as a rule, gave general satisfaction, as has usually been the case.

In the department of mining machinery several notable improvements were on exhibition, also some highly useful inventions in other provinces of industry. The display was rich in electric apparatus and appliances, denoting the intense interest with which everything pertaining to this new agent for the generation of light and the transmission of power is regarded by all classes of the community, the common mind being profoundly impressed with its possibilities. Next year it may be expected that more that is new and startling will find a place in the fair, these annual expositions showing the advances made year by year into the domain of this strange and subtle power.

Alexander Keller of Auburn had on exhibition a very creditable collection of mineral specimens, the most of them obtained in Placer, Nevada and El Dorado counties. There were in this collection over 100 samples of building stone, the most of them being of different varieties, showing how rich the above section of California is in material of this kind. The State Mining Bureau was represented by specimens of the useful metals and minerals, such as asbestus, chrome, cobre, manganese, etc., also by sections of the "Big Trees"—about the largest ever gotten out from these giants of the forest.

For the entertainment and instruction they afford the masses, these fairs are deserving of every encouragement, being worth always a great deal more than they cost.

A New and Splendid Companion to all the Metal Industries.

Fully abreast of the latest inventions and discoveries, as well in the largest and coarsest as in the smallest and finest of metal work.

JUST READY.
Price, $2.50.
Free of Postage to any Address in the World.

THE
Metal Worker's Handy-Book
—OF—
RECEIPTS and PROCESSES.

Being a collection of Chemical Formulas and Practical Manipulations for the working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by Wm. T. Brannt, editor of "The Techno Chemical Receipt Book" and "The Metallic Alloys." Illustrated by 83 engravings One volume, over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing a vast amount of valuable matter on all the Metals and Alloys, not to be found in any other book in the English language.

☞ *Price $2.50, free of postage to any address in the world.*

☞ *A circular of 24 pages, showing the full Table of Contents of this valuable book, will be sent free and free of postage to any one in any part of the world who will furnish us with his address.*

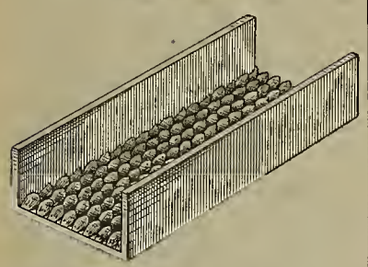
Gold Saving Device.
Patented June 17, 1890.



A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars. CHAS. TRAFTON, Yankee Jim's, Cal.

FRANCIS SMITH & CO.
Manufacturers of
Sheet Iron and Steel PIPE!
ALL SIZES,
130 Beale Street, San Francisco, Cal

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

C. H. EVANS & CO.
(Successors to THOMSON & EVANS),
110 and 112 Beale Street, S. F.
MACHINE WORKS,
Steam Pumps, Steam Engines
and all kinds of MACHINERY.

DEEP WELL PUMPS

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron
Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale st., S. F.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MF'G CO., 9 Nassau Street, Rockford, Illinois.

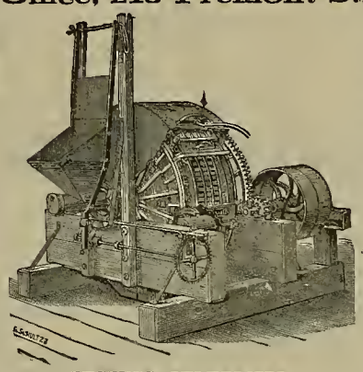
PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 Inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.
—MANUFACTURERS OF—



TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

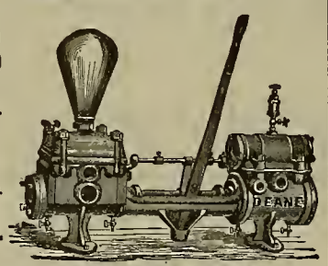
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.
SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,
718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Iron and Machine Works.

CALIFORNIA MACHINE WORKS,
WM. H. BIRCH & CO.,
ENGINEERS AND MACHINISTS,
No. 119 Beale St., - - San Francisco.
—BUILDERS OF—
Steam Engines, Saw Mills, Mining Machinery, Dredging Machines, Rock Crushers, Cable Railway Machinery, Ellithorp Air Brake Co.'s Patent Steam and Hydraulic Elevators, Air Cushions and Air Brakes. POSITIVE SAFETIES. Improved Ram Elevators, Sidewalk and Hand Hoists. B. E. Henrickson's Patent Automatic Safety Catches.
Machines of all kinds Made and Repaired. Orders Solicited.

UNION IRON WORKS,
SACRAMENTO, CAL.
ROOT, NEILSON & CO.,
MANUFACTURERS OF
Steam Engines, Boilers,
AND ALL KINDS OF
MACHINERY FOR MINING PURPOSES.
Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.
Front St., bet. N & O Sts., Sacramento, Cal.

Golden State & Miners Iron Works.
Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.
STEVENSON'S PATENT
Mold-Board AMALGAMATORS,
Golden State Pressure Blowers.
First St., between Howard & Folsom, S. F.

Saws.
SAW MILLS AND MACHINERY
Of all kinds made to order. Send for Descriptive Catalogue 17 and 19 Fremont St., San Francisco

DEWEY & CO. 220 Market St., S.F. Elevator, 12 Front. **Patent Agents.**

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Oodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL....

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

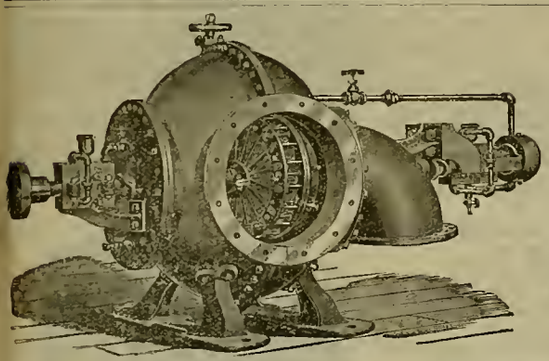
SUSPENDED TRAMWAYS.

General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

BRANCH OFFICES: NEW YORK, Room 43, No. 2 Wall St. DENVER, COLO., 1316 Eighteenth St. SALT LAKE CITY, UTAH, 7 W. Second South St. LONDON, ENG., 23 Bucklersbury, E. C. CHIHUAHUA CITY, MEXICO, No. 11 Calle de Juarez. LIMA, PERU, South America. JOHANNESBURG, TRANSVAAL, South Africa.

HELENA, MONTANA, Room 28, Merchants' National Bank Building, No. North Main St.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,

Springfield, Ohio, or 110 Liberty St., New York

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 800. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately in standard gauges and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

BURNHAM, PARRY, WILLIAMS & CO., PROPRIETORS, PHILADELPHIA, PA.

CLAYTON IMPROVED

ROCK DRILLS. MINING PUMPS.

AIR COMPRESSORS

For CATALOGUES, ESTIMATES, Etc., Address, Clayton Air Compressor Works OF BROOKLYN, N. Y. 43 DEY ST., NEW YORK.

The Best Mining District On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6 00 a year; WEEKLY, $2 50, *in advance*.

H. S. SPAULDING, Publisher.

T. C. HOCKING, Editor.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of October, 1890, an assessment (No. 20) of Six Cen's (6c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of December, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary pro tem.
Office—Room 11, No. 303 California Street, San Francisco, California.

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address Dr. Willis E. Everette, Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

It has produced over 10,000 tons of high-grade ore, and a very little expenditure will open up great quantities of ore that will run 20% or better in copper. Free Gold Mines for sale. Address W. H. WERFIELD, Box 39, Madera, Cal.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

THE ROLLER ORE FEEDER
[Patented May 28, 1882.]

THIS is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.
Golden State and Miners' Iron Works,
Sole Manufacturers,
327 First Street, San Francisco, Cal.

GRANGER'S ROLLER STAMP MILL
Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.

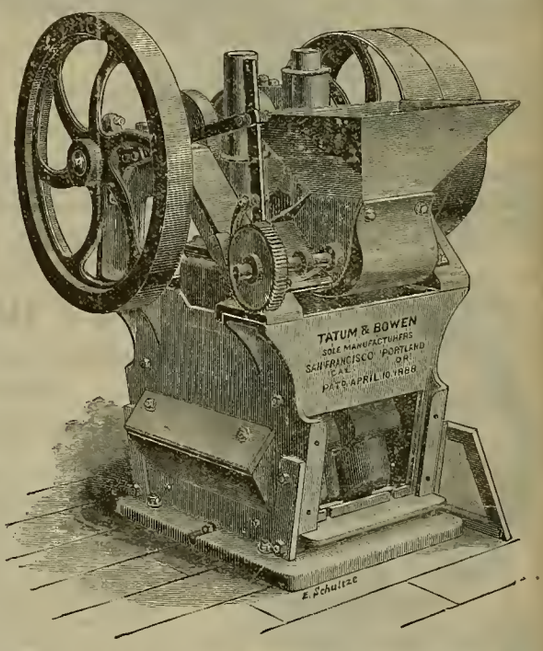
PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer.

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours, that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

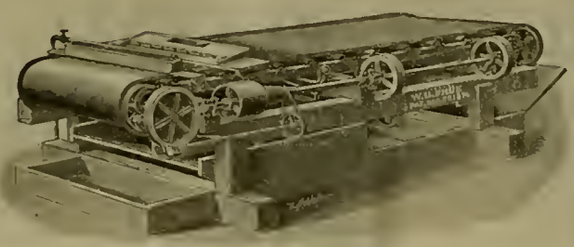
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

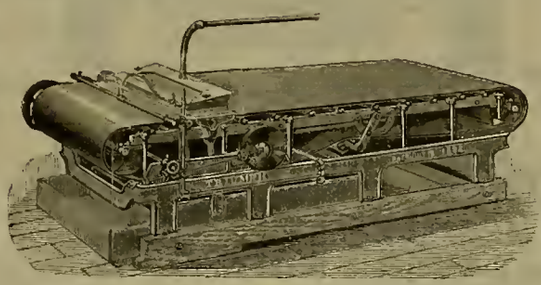
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,

Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

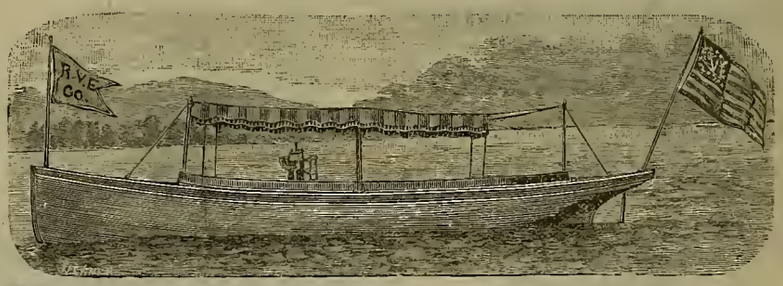
GEORGE HAAS, 324 Market St., Phelan Building, }
SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do s my work better than than those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be it understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $50 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.
Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and service ble for transportation, and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos Kane & Co, Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.

Power In or Out of the Shaft for Miners!

Our Perfected "Safety" Engines cost to run only 6 cents per working day and upward; they make their own vapor, and REVERSE instantly.

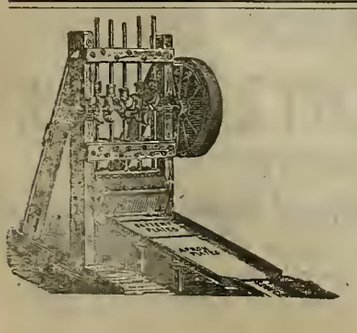
Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

CALIFORNIA STATE LIBRARY

The Davis-Colby Ore-Roaster.

The Davis-Colby ore-roaster for sulphurous iron ores is the outcome of some years of trial and practical experiences. The illustrations, taken from a paper by S. G. Valentine of Lebanon, Pa., will give a clear idea of the construction of the kiln. In general it consists of two shafts of brickwork inclosing between them an annular space, *E*, 18 to 24 inches in section, to contain the ore under treatment. The inner shaft, *F*, is continued to a proper hight above the top of the roaster to form the draft stack, as shown in Fig. 2, or it may be covered, as in Fig. 1, the products of combustion being carried downward and out through the flue, *F'*, to a separate chimney. This would allow of any utilization of the fumes deemed expedient. A cone-covered top, as shown, permits of more convenient charging, as ore can be dropped from car hoppers upon the cap, *L*, giving an even distribution of the ore. In the outer wall are placed the chutes, *C*, the fire arches, *B*, the gas flues, *X*, and the poking-holes and air flues, *Z*. Openings in the inner wall, *D*, admit the fumes and products of combustion to the draft stack, *F*. These openings are placed higher or lower, according to necessities arising from the character of the ore under treatment. The external shape, as shown in Figs. 2 and 3, is that of the Gjers kilns, which were remodeled to the new type. These illustrations are given to show how readily the ordinary style of roaster may be adapted to this new design. In some cases, particularly where dense, hard magnetites are to be roasted, the hight of the kiln is increased above that shown, for the purpose of giving the ore a longer exposure to heat; and the fire arches are put at a greater vertical distance apart, so that the ore may partially cool after its first heating, and be cracked or fissured, thereby exposing the remaining sulphur more thoroughly to the action at the second fire arches. A gallery around the outside, at the proper hight, gives workmen convenient access to fire arches and gas flues.

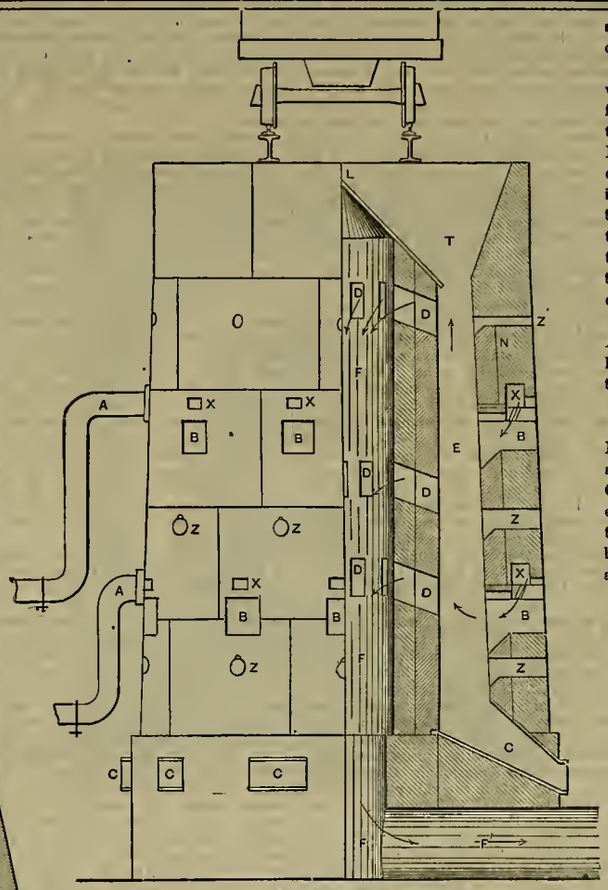

Fig. 1.—DOWN DRAFT DAVIS-COLBY ORE-ROASTER.

Gas from the mains *A* enters the flues *X* in the outer wall, and is distributed to each of the fire arches *B*, flowing downward through the outlets, as indicated by the arrows. Two or more sets of fire arches are used. In these the gas is burnt, the flame and heat impinging on the ore as it descends in the annular space *E*, raising it to any temperature required. This heating is done in the presence of abundant air, entering at the chutes *C*, the fire doors *B* and the poking-holes *Z*. After passing through the ore, the air enters the draft stack through the openings *D*, carrying with it the gaseous products of combustion and sulphur oxides from the ore.

The ore is filled in at the top *T*, passes down the space *E*, which gradually widens downward, and is drawn below from the chutes. Its cross-section being so narrow, the whole body of ore is thoroughly exposed to the fire.

MINES AND MINING AT THE FAIR.—The Committee on Mines and Mining of the World's Columbian Commission has organized, and the first meeting will be held at Chicago, Nov. 27th. It is proposed to have a building erected for the display of the products of the mines of the world. John W. Woodside of Philadelphia, a member of the committee representing the Middle, Atlantic and New England States, has issued a circular requesting all owners of mines and quarries, and manufacturers of mining machinery, who desire or propose to have exhibits, to communicate with him at 924 Arch street, Philadelphia, prior to Nov. 15th.

A VALUABLE Coal strike is reported in Sonora, Mexico.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Auriferous Cement Deposits of South Dakota.

EDITORS PRESS:—I have been much interested in the late articles of Prof. Hanks and Mr. Talbot on the gravel deposits of California. As there seems to be a striking resemblance between them and the so-called "cement" mines of this section, a description of these mines and the most probable theory of their origin may interest your readers.

They consist for the most part of a deposit of well-rounded bowlders, gravel and sand, formed mostly from fragments of quartzite and slate derived undoubtedly from the slates and quartz veins underlying them.

This conglomerate has been so completely solidified by a siliceous cement that a fracture will pass through the rounded quartz pebbles instead of around them.

It is generally of a red color at and near the surface, but at distances varying from a few feet to several hundred from the surface the color is generally blue, the rock then often carrying a liberal percentage of sulphurets.

They rest upon the upturned and eroded edges of the archæn slates, often in depressions and hollows that would lead one to infer they were once ancient river channels, were it not for the almost completely rounded form of the bowlders and pebbles, which in a river wash would at least show some of the fragments of rock to be but partially worn, and generally of a more irregular shape than the gravel of an ocean beach, which they seem to have once formed.

The writer was brought up alongside the ocean, and when he first saw these cement mines, the resemblance to the shore deposits of the eroded bluffs of his native town was so striking as to almost cause homesickness.

The bluffs spoken of are composed of the same well-rounded bowlders and pebbles as in these cement mines, though lacking their mineral character. This cement (to still use the local term) is generally overlaid by a quartzite which has been altered from a sandstone by the same agencies undoubtedly which has changed the gravel below to a solid mass of rock. This quartzite seems to indicate a gradual submergence of the shore line and a deposit of the finer particles of sand as the ocean advanced upon the sinking land.

Above all is a porphyry capping, the overflow of numerous dikes which traverse the slates below as well as the cement and quartzite.

Admitting these deposits often occupy depressions in the slate (or bedrock as it is called) resembling river channels; may we not suppose these depressions a consequence of the slate being of a more yielding and easily eroded nature in such apparent channels than that forming the rim.

It may also be in some places that the action of streams has formed channels before the subsidence of the land to the ocean level, but even that being the case, the almost spherical form of the bowlders and gravel proves the ocean wash has replaced that of the stream or river. This cement deposit extends over entirely too great an area to be accounted for by any supposable system of river channels, aside from the fact that they seem to form a belt encircling the entire central part of the Black Hills and gradually changing to sandstone and quartzite, as they recede from the Hills.

There have been many Californians here who have mined in the deep placers of that country, who claim a strong resemblance between the so-called channels here and there; still there are, no doubt, essential differences in their geological situation.

The overlying quartzite is, I believe, not found in California deposits, but that would seem to only prove the gradual elevation of the land instead of its subsidence as here.

The application of this theory to the deep placers of California is only suggestive, and can only be examined by one on the ground satisfactorily, and perhaps some of your readers may be able to give some of the results of their observations which would throw some light on the subject.

W. H. WASHBURN.

Deadwood, Oct. 19, 1890.

Notes from New Mexico.

EDITORS PRESS:—While at Deming, I heard considerable talk about the projected railroad from that point southward into Old Mexico, where it is known that the road would tap and open up an extensive and rich mining and agricultural region. This talk had received its late stimulus from the visit of an expert sent out to this country by a syndicate of English capitalists, who have signified their willingness to push the venture in case the expert now here can verify the previous reports made to the syndicate by the officers of the railroad in America. Our correspondent was surprised to see that much work had already been done upon the railroad in question. It is already graded for 50 miles or more, and could be speedily put in operation for that distance, which would take it into Mexican territory. The plan contemplates running into Mexico to the east of the Sierra Madre range of mountains, and at favorable points running branches to Chihuahua on the east and Topolobampo on the west. The probable future business of the road was indicated, to a degree at least, by the loads of ore which our correspondent saw hauled into Deming during his brief visit. There were several ox or mule teams, all freighting ore from mines 80 to 90 miles south of Deming, at which latter point it was to be sent by rail to the smelters at El Paso, Denver or Pueblo. The money so far expended on the Deming & Mexican railroad has been advanced by capitalists from Ohio and other Eastern States. This would be an important railroad, and if built will tend greatly to benefit Deming, its American terminus.

Socorro.

The town of Socorro presents a characteristic illustration of the ups and downs of a mining camp or settlement. There are no mines immediately at Socorro, but a number of years ago the mountains back from that old town were found to contain many excellent prospects and people flocked in from all directions. The mines were developed and the entire region had a mining boom. Socorro prospered amazingly and business houses, residences and structures of all kinds went up by the score. It is said that the city contained a population of 10,000 souls. It was the headquarters for teamsters, who had an immense business in hauling ores from the mountainous regions around Magdalena and Kelly to Socorro, where an extensive smelter was erected, and where also the ores were shipped to other points by rail. In recent years a railroad has been built from Magdalena direct to the Socorro smelter, and to a connection with the Santa Fe railroad at Socorro. This has put a quietus upon the teaming business which so stimulated Socorro's growth. Many of the mining properties have ceased to be worked and there has been a gradual shrinkage of the mining interests immediately adjacent to the old town. The camps of Magdalena and Kelly continue to thrive, but Socorro has become partially depopulated. There are dozens of vacant store buildings and scores of adobe and frame residences which stand as evidences of what Socorro must have been in her palmy days. There are still several plucky and enterprising merchants in the city who yet do a fair business with the people of the surrounding country. The decline at Socorro has probably "struck bottom," and from now on there will be a tendency upward. The smelter, located within a mile or two of town, employs 125 men, and in its three furnaces, works up some 125 tons of ore per day. This ore comes mainly from Magdalena and Kelly, but a goodly portion of the supply also comes from other parts of New Mexico, from Arizona, and from Old Mexico. The mines of the mountainous district back from Socorro are beginning to attract renewed attention, especially since there is a better look for silver-copper properties, and since new methods in the reduction of ores are supplanting old and extravagant methods. We look for prosperous times in the vicinity of Socorro, and perhaps the town may yet revive and take rank as one of the Territory's leading cities. It still has a population of 500 or more, is the county seat of Socorro county, and is a pleasantly situated and healthful city. It is in the valley of the Rio Grande, 75 miles below Albuquerque, on the line of the Santa Fe railroad from that city to El Paso, Texas, from which latter place it is distant 178 miles. An extensive milling plant in the outskirts of Socorro is now idle, but it is thought the stamps may begin dropping some time the coming winter. Besides the smelting company in Socorro, Sperling Bros., merchants, H. R. Brown of the Central hotel, and Geo. H. Thwaites, are enterprising citizens interested in mining matters. P.

Socorro, New Mexico, Oct. 23, 1890.

A BIG BUSINESS.—The business year of the house of Armour & Co., Chicago, closed October 1st, and the exhibit which this firm presents for the past year is interesting for the magnitude of its operations. The sales amounted to $55,000,000, which has far exceeded any previous year, and over 27 per cent of the total killing at Chicago for the year. They slaughtered 650,000 cattle during the year, and also 350,000 sheep. The gross weight of these 1,000,000 animals is not stated, but was approximately 1,150,000,000 pounds, or 575,000 tons, equivalent to 48,000 carloads of 12 tons each, or an average exceeding 150 cars for each business day of the year. Employment is given to 7000 persons, whose wages amount to $3,500,000.

ELECTRICITY ON THE NEW YORK ELEVATED ROADS.—The managers of the New York City elevated roads, it is said, have not abandoned the plan to propel the trains by electricity. Russell Sage says the day is not far distant when electricity will supersede steam on the elevated roads, and horses will be no more used on the surface lines. He believes the cost of operating the elevated lines could be reduced nearly ten per cent by the adoption of electricity.

AT the Electrical Exhibition of 1881 the most powerful dynamo was an Edison machine, giving 800 amperes and 110 volts (120-horse power). The Berlin central stations now have 500-horse power dynamos, and at Deptford a 3000-horse power alternator is at work, and two 10,000-horse power machines are expected shortly to be in operation.

Coal in the Black Hills.

Coal has been found at a number of places, the first discovery of importance being at the Hay Creek mines, located northwest of Deadwood and northeast of Sun Dance. The bed was variable in thickness and quality, and, while superior to the ordinary lignites of the Laramie group, was not pure enough to encourage active developments. Some fairly good prospects were found between Sun Dance and Newcastle, on the west side of the Black Hills. The best area developed at this date is at Newcastle, the present terminus of the Black Hills branch of the Chicago, Burlington & Quincy system, on which the rails have just been laid. The coal occurs, apparently in the Dakota sandstone group, which here consists of three massive sandstones, ranging from 50 to 100 feet in thickness, and separated by soft shales and slates, the whole having a combined thickness of perhaps something more than 300 feet. The principal coal-bed is found above the lower sandstone which directly overlies the red-beds of the Jura-Triassic. In the absence of proper paleontological evidence, we cannot positively assert the Dakota age of this coal horizon, but the apparent integrity of this sandstone group as a whole, warrants the assumption that the coal is of cretaceous age; for the upper member of the group seems certainly Dakota, and to whatever the top-rock belongs, the lower portion must also be assigned.

Shortly after explorations were commenced, I found that the outcrop of the coal had been burnt, and the search for coal became at once a search for ashes. The area in which the explorations were made was a plateau or table ranging from 600 up to 1200 feet above the plains to the west (from which it gradually rises) and cut by frequent sharp canyons, 200 to 500 feet deep, along the sides of which the outcrop of the coal was usually above water level. In some localities the outcrop was readily found, and the full thickness of coal was exposed by drifting a few feet; but where the outcrop had been burnt the coal was rarely found until the ashes and burnt rock had been drifted upon from 50 to 100 feet. The coal is one of the varieties difficult to classify, bearing intimate relations to coals both of bituminous and of lignitic composition. It is black and lustrous with a somewhat conchoidal fracture, and good coking properties. From its appearance and coking properties one might be justified in classing it as a true bituminous coal, but in chemical composition it is also closely allied to the lignites.

This coal will doubtless find a large market in Wyoming, Nebraska, Dakota and Montana. For domestic purposes, and for railroad and steaming use generally, it is far superior to any of the true lignites. The percentage of ash and water is moderate (averaging less than eight per cent), being somewhat higher than Rock Springs coal. The samples analyzed contained more sulphur than Rock Springs coal, but less than many of the Iowa and Missouri coals on which Nebraska is now largely dependent; and the ash percentage was very much lower than in most of these Missouri and Iowa coals. It is a strong steam coal, is very hard, does not slack upon exposure, and will bear transportation and handling well. Its coking properties have already been described. The Dakota sandstone is not generally known as a coal-bearing formation. In a paper read before the Institute, in October, 1888 (*Trans.* XVII., 375), Mr. G. C Hewett notes the occurrence of coal in the Dakota sandstone between the White and Yampa rivers, in Northwestern Colorado, which may correspond to the horizon of the Wyoming bed.

The developments made up to date indicate clearly that while in certain districts coal-beds of workable thickness and quality exist in this Dakota sandstone formation, the workable coal is not co-extensive with the formation; in other words, the presence of this formation in any locality is merely an indication that workable coal may possibly exist. At the time my examinations were completed, the bed developed in the Newcastle field showed from 4 to 7½ feet of workable coal with no important slate partings. Subsequent explorations, I am informed, have shown the presence of a considerable area, ranging from 8 to 9 feet in thickness. From the Belle Fourche west to the Big Horn mountains, the typical lignites of the Laramie group are finely exposed by repeated natural outcrops in canyons and cliffs, more especially on the headwaters of Donkey creek, Horse creek, Wild Horse creek, and the numerous affluents of the Powder river. These lignite beds range from 3 to 4 feet up to 22 feet in thickness, and are admirably situated for mining, being above water-level, and lying almost flat, so as to present many points at which self-draining mines may be opened and cheaply operated. Averaging about 20 per cent in water, these coals have low calorific value; and "slacking" upon exposure to the air (by drying), they will not bear transportation. Hence, while useful as a local fuel supply, they are not likely to become commercially valuable until some cheap method is devised for artificially evaporating the water and manufacturing a "briquette," or artificial fuel. Their low percentage of sulphur and ash would assure the production of a most excellent fuel, and the problem seems to be purely one of cost and of mastering the details of manufacture.

The area of this lignite field is very great, certainly more than 7000 square miles; and that some method of utilizing this enormous body of fuel will ultimately be devised, we cannot doubt. I believe a fuel equal to the best bituminous coal could be produced from these lignites artificially at a cost of about $2 per ton, and such a fuel would have one great advantage over ordinary bituminous coal, as it would reach the consumer in blocks (or eggs or spheres) of uniform shape, size and composition. —*H. M. Chance, M. E.*

The Cause of It.

No doubt all who have been depressed and disgruntled by the unusual duration of hot, dry weather will be glad to know the reason why the peculiar phenomena exist and continue so long, and why we had a wet October last year and just the opposite this year. Lieut. Finley of the Signal Service, being interviewed by a city reporter gave the following interesting statement:

"It is true that the difference between the temperature of this month and that of October, 1889, is most marked. In the latter month there was not a single day when rain did not fall somewhere on the Pacific Coast.

"In October, 1889," said the lieutenant, "the rains which came from the Japan current moved eastward over British Columbia, carrying the rain center northward of this portion of the United States. They then moved farther south, carrying the area of precipitation into California. In October, 1890, these storms have moved eastward so far north that the rain which attended them has been confined to Oregon and Washington, and did not reach California.

"As to the north winds which for the past week have prevailed, bringing a heated spell, they are due entirely to the presence of an area of dry air and clear weather prevailing over Nevada, Utah and South Idaho, with a slight depression of the barometer just off the coast of Southern California. This area of dry weather is called on the charts 'high,' because the air is denser and heavier. The depression off the coast of California is called 'low,' because the air is moist and lighter. The north winds result from the movement of the clear, dry air of the 'high' to the warm, moist air of the 'low.' There is a gradience between the two which causes the air to flow away from the place of the highest pressure to the lowest. The air in moving from the 'high' to the 'low' is obliged to pass over the heated sandy soils of Nevada, and by the time they reach California have absorbed an enormous quantity of heat. They therefore appear as scorching hot winds. The sun beats down from a cloudless sky on the desert regions of Nevada, and the earth becomes quickly heated to a high degree, so that the air as it passes over the ground takes up the heat of the soil and carries it onward."

At the time of the interview on Tuesday last, Lieut. Finley thought the same weather might prevail a couple of days longer at least. A rainstorm hreaking loose from the Japan current seems to be our hope for relief, and we trust it will not be long delayed, though this weather has done well in bringing in the outstanding fruit in the best condition.

FREEZING QUICKSANDS.—Quicksands have always been one of the most formidable engineering obstacles in shaft-sinking and in building foundations for bridge piers, but by the use of freezing mixtures these obstacles may be overcome. The common method of circulating the freezing mixtures is by means of a line of vertical tubes driven into the sand a short distance apart and just outside the circumference of the desired opening or shaft. When the freezing fluid is forced into the pipes the quicksand gradually solidifies into a firm, hard wall of sufficient strength to retain its shape while the inclosed shaft is being excavated and lined. This method has been often used in bridge-work, and recently it has been very successfully applied in shaft-sinking in the Lake Superior ore-mining region, where strata of thin quicksand have been encountered some distance below the surface. A more recent method of overcoming the same obstacle has been devised by a German engineer, Fr. Nenkirch, of Bremen. This method is quite similar to the freezing process, the refrigerating mixtures being replaced by cement. Iron tubes, pointed and perforated at their lower ends, are thrust into the quicksand at intervals of 10 or 15 inches on the area of the desired work, and when the proper depth has been reached, cement is forced through the pipes by a current of compressed air. The blast of air thoroughly mixes the cement with the sand and water, and a solid mass is quickly formed.

A BOOK FOR ALL WHO TRAVEL BY RAIL.—We are indebted to the Bancroft Company for a copy of the American Geological Railway Guide, wherein the geological features of the country adjacent to every railway station, with altitudes, etc., are given; also remarks on leading places along the various routes. While this is a work of interest to every class of readers, it must prove especially useful to those who travel much by rail. To be had of the Bancroft Co. of this city.

THE crude material of asbestos has a demand in London from £18 to £100 per ton—$500 per ton, American money. The Bell Company's output is 2000 tons per annum.

NUMBER XVIII.

[Written for the PRESS by JAMES H. CROSEMAN.]

The Lava-Bed Mining District

Is situated in the Lava-bed Range of mountains, a southeasterly prolongation of the Ord Range, and at a point 26 miles nearly east from Daggett. Formation, syenitic and porphyritic; strike of the strata north 22 degrees east; greatest elevation, 4175 feet. In this mountain occur several powerful veins which crop from 10 to 50 feet in hight and are traceable for long distances on their line of strike. The principal mining locations here are as follows:

The Mammoth,

Which cuts the formation at an acute angle, its course being N. 70 degrees west with a southerly dip of 80 degrees. The vein is of banded structure and carries four feet of good ore. It measures from wall to wall from 20 to 40 feet, and has heavy croppings the full length of the claim. In places it rises to a vertical hight of 25 feet, resembling a mammoth wall. Below the surface the vein has been much broken and disturbed from the effect of volcanic action, non-mineral bearing foreign matter having been injected into the quartz or gangue, reducing the value of the mass. This claim has been developed by two shafts—one 20 and the other 30 feet in depth. The gangue proper is composed of quartz and heavy spar. The assay value of the ores in silver varies from 20 to 95 ounces per ton, and from 5 to 15 per cent lead in the form of carbonates and sulphides.

The Meteor,

An extension of the Mammoth, carries bold, heavy croppings and has a width between its incasing walls of from 9 to 20 feet. Its gangue is quartz and a brecciated mass of volcanic rock. The ores are a soft carbonate of lead, with spots and bunches of galena which run high in silver. It is reported that this mine has yielded in silver values $20,000. The developments consist of a drift on the lode 38 feet, a crosscut 40 feet, with lateral drift of 40 feet. Shaft 90 feet deep, with good ore in the bottom 4 feet wide.

The Rising Sun

Lies parallel with the Meteor on its northerly side. Width of vein 8 feet; formation similar to the Meteor; developed by a 75-foot tunnel, and in the middle of the claim an open cut. Value, 40 to 50 oz. silver per ton.

Five miles in a northerly direction from this mine in the center of a low depression or dry lake, two volcanic cones are seen, their cup-shaped craters being plainly visible in the bed of the largest dry lake, which covers an area of 25 square miles at an elevation of 1920 feet. Two wells have been sunk, the one to a depth of 60 and the other of 90 feet. From these an inexhaustible supply of water is obtained. At a greater depth, in all probability, artesian water could be procured. At the Warm Springs Dry Lake, 20 miles westerly from this point, an inexhaustible supply of water can be obtained but a few feet from the surface, demonstrating that while the surface may be void of moisture, the substratum at varying depths is thoroughly saturated.

The Morning Star Mine

Lies at the extreme easterly end of the Lava-bed Range at an elevation of 3050 feet. The strike of the lode is north 70 degrees west. The comb of the vein rises above the surface to a hight of 35 feet and measures 20 feet between its incasing wall, but carries only four feet of ore, which is reported to assay 30 ounces per ton in silver. At this point a tunnel has been driven in on the lode a short distance; thence in a westerly direction 350 feet on the strike of the vein, a second tunnel has been driven connecting with a vertical shaft sunk in good ore to a depth of 70 feet, where some stoping has been done. From the tunnel level two winzes have been put down 30 and 70 feet. Tunnel No. 3 has been driven in on the south wall of the vein, carrying four feet of low-grade ore, from which a diagonal crosscut has been driven for a distance of 150 feet. The croppings, which are bold and strong, expose some good ore 12 feet in thickness. Two hundred and fifty feet distant, in a southerly direction, a spur falls into the main vein which carries galena assaying 45 per cent in lead and $7 in silver. The spurs and feeders that fall in from the north side of the lode all carry galena; on one of these an 80-foot tunnel has been driven.

The Pequot,

Though a strong vein, has been but little developed.

The Tip Top Vein

Strikes north 70 degrees west; dip 45 degrees northeasterly; vein 10 feet wide; gangue a dark ferruginous quartz assaying $24.50 in gold.

The Everett Lode

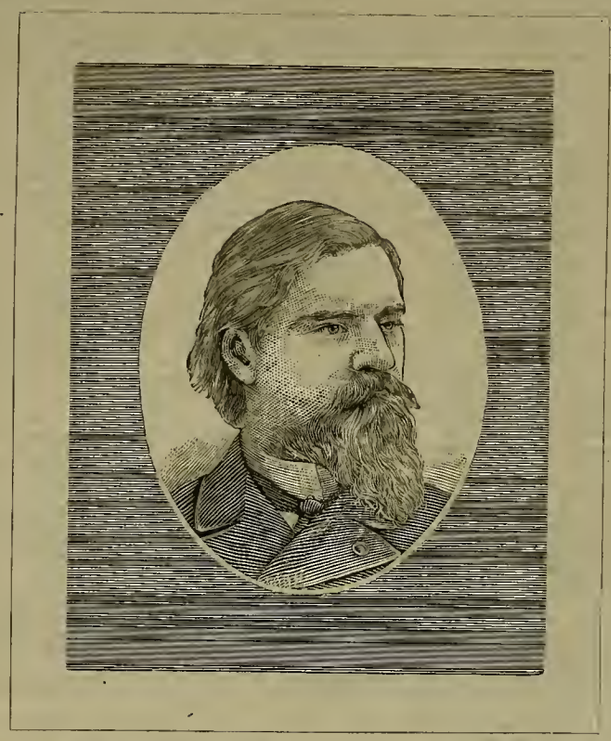
Lies at an elevation of 2950 feet; vein 18 feet wide, carrying four feet of ore which assays nine ounces silver per ton, developed by a shaft 60 feet deep and two drifts respectively 25 and 30 feet long; walls well defined. The ores of these mines are hand-picked and are shipped to San Francisco by the company, there being no reduction works in the vicinity of the mine.

Dry Lake District

Lies immediately south of the Lava Bed, in Tp. 6 W., R. 4 E., comprising an area of 36 square miles. In this district a number of locations have been made, though little work has as yet been done upon them. The ores carry silver, gold and lead. A. F. Lucas is developing a gold-bearing mine here that promises to prove a valuable property.

The Twenty-Nine Palm District,

Which covers an area of 360 square miles, derives its name from a group of palms surrounding several living springs of pure water which serve to irrigate a considerable area of the surrounding country, now under a good state of cultivation. Several arastras are run here on gold-bearing quartz. This district has been subdivided and the Virginia Dale and Minnie McConckey districts segregated from it. The former is located 31 miles in a southerly direction from Bagdad on the Atlantic & Pacific R. R. and 75 miles from Banning, a station on the Southern Pacific. The isolated position of the mines here has hitherto prevented their being generally known, notwithstanding the strength and persistence of the veins and the unusual richness of the ores, which consist of silver, copper and lead—the latter in the form of sulphides, oxides and carbonates, with chlorides of silver—some of the veins being exclusively gold-bearing. In this district are four locations on a continuous vein four feet in width, known as the Rattler, Virginia Dale, Wilson and South End. In all, some 40 locations have been made. The developments of the Virginia



COLONEL GEORGE R. DAVIS, DIRECTOR-GENERAL OF THE WORLD'S FAIR.

Dale consist of Shaft No. 1, 146 feet in depth, Shaft No. 2, 100 feet deep, connected by longitudinal drifts 100 feet in length, which have been extended northerly and southerly 100 feet farther on the line of the vein. Winzes have also been sunk to depths of from 50 to 100 feet on the vein. Enough stoping has been done to prove the gold-bearing character and value of the ores. The mine is under the management of I. C. Youngman of Pomona—the incorporation being known as the Virginia Dale Mill and Mining Co. The Clip mine, situated three miles to the east, has been developed by a 25-foot shaft, ledge 6 feet between walls, all ore which has paid $20 per ton in free gold by the mill process.

In the vicinity of these mines two wells have been sunk 600 feet apart, affording an abundant supply of water. One is 195 feet deep, the other 95 feet. For working the ores of this locality a 5-stamp mill has been erected at a point five miles distant from the mines.

The 29 Palms group of mines is situated from 15 to 28 miles distant in a southeasterly direction, the formation being porphyry and granite, with a belt of limestone lying on the south side; the veins course east and west.

The McConckey mine has been developed by a shaft 100 feet deep. The ores contain copper, lead and silver.

The Minnie McConckey District,

Which was discovered and formed in 1886, is situated 18 miles southeast of 29 Palms, six miles from Lyons mills, and eight miles south of the Virginia Dale mine and range of mountains. The True Business, situated in this district, has been developed by a shaft sunk on the inclination of the lode to a depth of 100 feet. Another shaft 600 feet easterly has been sunk to a depth of 25 feet, both being in high-grade ore, vein strong and well defined, incased in walls of limestone and granite. The ores are reported to carry lead, silver and gold in the proportion of, 50 per cent lead, 25 to 75 oz. silver and from $50 to $100 in gold per ton. Six locations have been made on this vein westerly from the discovery and one easterly. An adit level has been commenced which will tap the vein at a depth of 150 feet at a distance of 200 feet. Seven miles distant from the mine a well has been sunk to a depth of 90 feet, affording an abundant supply of water for milling purposes. The croppings on the surface of the vein at its point of greatest expansion vary in width from 25 to 30 feet.

The Big Mesquit Mine,

Which lies southeasterly from and three miles distant from the above, carries the same class of ore, but the vein is not so large and with less development. Lying to the north, we find the Poliz mine, of a similar character. The Eagle mountain copper mines, situated 20 miles south of 29 Palms, carry copper, silver and gold; vein from 4 to 6 feet in width; value of ore from $60 to $70 per ton. In the vicinity of 29 Palms, a quartz vein 2 to 10 feet in width occurs. It carries a rich streak of gold ore which the owners are working by a hand mortar.

Bagdad district is situated northeast of 29 Palms in the Bagdad Range of mountains and seven miles from Bagdad Station on the A. & P. R. R. A group of small veins occurs here carrying lead and silver. These veins, though small, are persistent on their line of strike and carry 30 per cent of lead and an average of 25 ounces silver per ton. Select samples run as high as $4000 in silver. Some 40 locations have been made here. The deepest shaft is 30 feet; formation, porphyry. The principal locations are owned by Messrs. Corley, Gass & Vickey.

The Grapevine Mining District

Is situated north of the Mojave river and west of the Calico mining district. Its formation is composed of feldspathic, porphyritic and calcareous rocks, much changed from the effects of subterranean heat. Strong and well-defined metalliferous veins occur here carrying the ores of silver and lead.

The Stonewall Jackson mine lies six miles in a northwesterly direction from Baratow, a railroad station, and in the vicinity of the Waterman silver mine. Strike of vein, northwest and southeast, developed by an incline shaft 36 feet deep, Dip of lode for the first 28 feet is 40°, and for the remaining 8 feet, 60°. Vein at bottom shows a width of eight feet between walls; gangue quartz; mineral, galena and carbonates of lead carrying considerable iron oxides.

The Beauregard,

Located on the above vein, has a northerly strike and is of the same character of ore as found on the Stonewall Jackson.

The next adjoining claim on the line of the lead is the Honeycomb; strike northwest and southeast, developed by shaft 9 feet deep and 12 feet wide. The next claim is the No Name; shaft 35 feet deep, all in ore of same character as Stonewall. Another shaft, 200 feet distant on the line of the lode, has been sunk to a depth of 40 feet; inclination of lode, 65°. The Ventura and Jupiter adjoin and are developed by shafts and cuts carrying ore of like character as above.

The Cleveland Mine,

Located on a lone mountain near the Calico district's boundary line, is distant five miles northwest from Daggett and four from the town of Calico. This mine has been developed by an incline shaft 170 feet deep. Vein dips E. 35 degrees. A crosscut shows the width of the vein to be 14 feet, the richest portion lying on the footwall. Hanging-wall, porphyry; foot a decomposed feldspathic rock. Samples of average ore sent to the Selby Smelting Works yielded 26 per cent lead and 20 ounces silver per ton.

The Cuticura,

Which adjoins the Cleveland on the west, is a parallel lode; formation, calcareous shale metamorphosed and changed; strike northwest and southeast; dip, northeasterly at an angle of 60 degrees; gangue, lime and quartz; ores, silver-bearing carbonates and oxides of lead; vein four feet in width and well defined, developed by a shaft 60 feet deep, with several open cuts. Cornish rolls and jigs have recently been erected on the property and as reported successfully and profitably worked; concentrates shipped to Selby in San Francisco.

On the Midnight, an easterly extension of the Cuticura, but little work has been done. It has, however, the same class of ore with concentrating works. This desert region contains numerous other veins carrying the ores of lead and silver, all sufficiently rich at current rates to warrant treatment by concentration, and in the absence of a smelting plant, to ship the concentrates to San Francisco, for sale or reduction.

The Waterman Mine,

Which has been extensively worked and large values extracted, is by no means exhausted, though now lying idle, litigation having prevented resumption of work here. In the vicinity of the Waterman a vein is being developed that runs high in silver, and the owners have every confidence in the future of the property. This is known as a blind vein, as it did not crop on the surface. It is being developed by a shaft, and judging from the strike it is the same as the Waterman, the character of the gangue and the ore being similar—the first contains baryta and quartz, the latter being rich in the chlorides of silver. Jas. Waters of San Bernardino is one of the principal owners of this mine.

(To be Continued.)

The Director of the World's Fair.

Colonel Geo. R. Davis, Director-General of the World's Fair, whose portrait we present on this page, was born at Three Rivers, Palmer, Mass., Jan. 3, 1840, and educated in the public schools, and at Williston Seminary, where he graduated in 1860. Entering upon the study of law, he was admitted in due course, but in 1860 forsook his chosen profession to join the Union army. He enlisted in the Eighth Massachusetts Volunteer Infantry, and soon became a captain. At the close of the contest he became a resident of Chicago, still retaining his interest in military matters. He took a leading part in the organization of the local militia, and was made commander of the First Regiment of Infantry, Illinois National Guard, and senior colonel in the State service. In 1876 he was nominated for Congress by the Republicans of his district and defeated, though running largely ahead of the Presidential ticket. Two years later he was more successful and was elected. He was re-elected in 1880, and again in 1882. At present Colonel Davis holds the position of Treasurer of Cook county, of which Chicago is the seat.

BRITISH SHIPBUILDING.—Lloyd's Register Shipbuilding Returns for the last quarter show unmistakable signs of falling off throughout the whole of the United Kingdom. The decline was to be expected from the high rates of materials and wages. The tonnage of vessels building is 123,000 less than the preceding three months; and the number of vessels preparing to be built shows a decline of 87,000 tons. Of vessels at present in hand, more are being built on "spec." than in the preceding quarter; and as compared with the same period a year ago, the falling off in this respect is very marked. On the Clyde there is a reduction of 49 vessels, the number for the last quarter being 114 in place of 163 in the preceding period; on the Tyne there are 66 vessels as compared with 72; on the Wear 47 instead of 59; in the Hartlepool district 50 in place of 59. The tonnage of the vessels under construction is also less in proportion. When materials and wages have adjusted themselves to the altered state of matters, we may hope for a revival, as shipowners are holding off, being unwilling to place orders on a falling market which has not yet by any means reached its lowest point.

MAKING IRON WITHOUT PUDDLING.—Dr. Emmens of Greensburg, Pa., is said to be the discoverer of a process of making wrought iron from pig metal without puddling. A vat is filled with a chemical solution and a number of thin sheet-iron plates. The pig iron is also placed in the vat, and the two metals are connected to a dynamo. The current, which is then passed through the vat, is said to have the effect of causing the pure iron to be separated from the impurities in the pig iron, and to form a deposit on the sheet-iron plates. It is claimed that the wrought iron produced can be bent, rolled or twisted into any shape while cold, and is superior to the best Swedish metal. Dr. Emmens says he can take a horseshoe nail of this iron, fasten the head in a vise, and twist it into an almost perfect screw without breaking it.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Inyo.

ORE SHIPMENTS.—*Index*, Oct. 29: The Brown Monster mine shipped one and one-half carloads of ore this week. At each trip from the Defiance mine at Darwin, J. V. Skinner brings in ten tons of ore. The mine is looking very well and improving as more opening is made. The new water works is nearly completed. Water is now run to the tanks in town. Mr. Reddy is still at the mine pushing on the work of development and getting the water works finished. Four or five carloads of ore are sent down from Cerro Gordo every week. The Dunphy-O'Keefe mine yields most of this. Good reports come from the Union mine and the expectation is strong of striking a large ore body speedily.

FROM SYLVANIA.—*Register*, Oct. 30: Water has been found in the Liheral shaft, and it interferes with work to such an extent that sinking has been suspended and crosscutting commenced. The Climax tunnel was driven 45 feet last week, and is now over 400 feet in length. Work on the shaft that was being sunk on the Climax mine has been suspended, and the force working there has resumed operations in the tunnel on Liberal ground in the hill just across the canyon, and northwest of the Liheral shaft. The ground in the tunnel indicates that the ledge is not far away.

MARBLE.—About 25 men are regularly employed at the Inyo marble works, four miles north of Keeler, getting out huge blocks of the white marble for the Mills building and the general market.

MINES, MARBLE AND SODA.—Bishop *Register*, Oct. 23: Sam Piper has opened up one of the richest gold ledges in this section. It is a mile or so north of Cottonwood creek, east of the Inyos and just within the Mono lines. He has also just got his new water-power arastra in operation. C. Wonacott has about finished the construction of a fine water-power double arastra on a stream near the old Sacramento mine for Joe Lopez. It is for the working of about 1000 tons of rather low-grade ores already on the dump near at hand. L. F. J. Winkle, superintendent, and B. F. Gray, assistant, are making a grand success of the soda enterprise. Its reduction works have within the year been more than doubled and processes improved upon, so that the big investment begins to pay a fair profit. The wet season has raised the lake a few feet, reducing the grade of the water from 8 to 10 degrees, but this has not perceptibly affected the output. The area of the vats is being constantly if not rapidly enlarged. In time there will be fully 1000 acres of these vats. All grades of the product are being shipped in increasing quantities, but more in the crude state than formerly for milling (silver), glass-making and other manufacturing purposes. About 25 men are regularly employed at the Inyo Marble Works, four miles north of Keeler, getting out huge blocks of the white marble for the Mills building and the general market. This important enterprise seems to be in quite a prosperous condition. Mr. Pidge, an experienced marble worker from Minnesota, is in charge of the quarry, with Al Staudenger as general assistant. The blocks go to the company's new mill on the Truckee for sawing and finishing for use.

Nevada.

IDAHO MINE.—*Tidings*, Nov. 1: Underground work in this mine has been temporarily suspended until the new pump rods are put in from the surface to the bottom of the mine. This is being done in preparation for the winter season, when the surface water gives the pumps more work to do. The depth of the mine causes a heavy strain up the long line of pump rods, and a general renewal of the timbers has been found to be necessary. No definite time has been set for resuming underground work, but the mill is kept going steadily, as there is a large supply of ore on hand.

THE OLD EAGLE BIRD.—*Tidings*, Oct. 26: The Diamond D., the old Eagle Bird mine in Washington district, now under the superintendence of H. C. Callahan, has a good record. The 30-stamp mill has been running continuously for two years, all the ore extracted being put through the batteries. What the net income is has not been given to the public, but the bars of bullion that are shipped monthly prove that dividends are of regular occurrence. Since the present owners have taken charge there have been numerous expensive improvements made in and around the mine. A road leading up the mountain to the Omega ridge and to connect with the Emigrant Gap road cost between $12,000 and $20,000. It is of great value to the mine, as it enables the owners to procure freight cheaply and expeditiously. It also opens up an extensive timber belt for use at the mine. A sawmill has also been erected, so that lumber and timbers are furnished to the mine for about $10 per thousand. The old compressor works have been moved down to the river, and a new compressor added. The shaft has been enlarged and made into double compartments, and extended down to the 600-foot level. A new hoisting works and building have been put up. A store has been built and stocked. A fine two-story residence is being constructed and is nearly completed. Cottages for employes have been built, and many other improvements have been made. Where labor-saving appliances can be used they have been supplied. The present owners bought the mine when it was reported as played out. But the past two years' run of 30 stamps has been made on ore then opened, and it will take four months yet to exhaust it. In the meantime explorations have been going on, so that the mill will be kept running on new supplies for an indefinite period. A mine that supplies 30 stamps continuously tells its own story.

San Bernardino.

TEMESCAL TIN MINES.—San Diego *Sun*, Nov. 1: Taking the principal tin mine, the Cajalco, as a central point, 700 feet northwesterly from the main shaft a well-defined vein of tin occurs; 75 feet southeasterly a strong line of croppings shows a promising vein of 325 feet in the same direction and the tin-bearing vein occurs, showing a long line of croppings which give high assays. Also in the same course three parallel veins are encountered, and at a distance of 600 feet the Little Scotty is seen with an incline shaft of 15 feet deep sunk on a rich body of ore. Samples of this ore show 20 per cent block tin, the vein showing an average width of 30 feet and is traceable for a long distance.

GOLD AND SILVER MINES.—About a mile from Temecula creek is a group of silver and gold mines, one of these showing a width of eight feet. From the ore exposed several samples were assayed with the following result: Silver, 165 ounces per ton; gold, $7.50; copper, 15 per cent.

Shasta.

THE PENROSE AND THE SCHERER MINES.—*Free Press*, Nov. 1: George Smith, with Mr. Parmlee of the reduction works, visited Penrose's mine at Gambler's gulch recently, and upon asking Mr. Smith for his opinion of the mine, he told us that it looked exceedingly well; that there is a fine-looking ledge 8 feet so far and not yet cut across; that the ore shows well, and from assays made is quite rich. P. Scherer has returned from San Francisco, where he has been to buy an air compressor, a Burleigh drill and other necessary machinery to work his tellurium mine. Pete says everything is looking well. The location of quartz mines in and around Shasta, and the working of many of them, is having a good effect on local business, and will improve.

Siskiyou.

THE OLIVE QUARTZ MINE.—Yreka *Sentinel*, Nov. 1: This mine, located at Indian Creek, near Hooperville, and owned by J. W. Smith & Co., is a well-developed lode and will probably prove a rich hooanza, says the Yreka *Journal*. The company has about 200 tons on the dump ready for crushing in its new mill to be put up next spring. They have run a 500-foot tunnel and found the ledge five feet thick, with prospects paying at the rate of $2000 to $3000 per ton. The Allen Bros., at Quartz valley, have been taking out some very rich quartz lately, paying from five to seven ounces of gold to the ton. The Spencer ledge, at Humbug, prospects well and the indications of a rich and permanent ledge are very flattering.

DOWN THE KLAMATH.—The Phil Mott claim is operated by seven partners, but without the success their efforts deserve. They are down to bedrock at a depth of 55 feet, and do not find very much gold—but they are working away and we wish them better luck in the future. There are a number of other river claims at this point and two miles up Empire creek is the Golden Age quartz mine. This mine has been worked at for a number of years, but this season they have been engaged in sinking a shaft, at the bottom of which there is a vein of particularly rich ore which is now being worked on. It is the intention of the owners to move their mill from the Klamath up to the mine, where its ten stamps will crush the ore in much quicker order than the area traction has heretofore done the work. The McConnell claim up river from Hoopa Valley is paying well, and the works here are the most extensive on the river. At the mouth of the Humbug the Spanglers are doing well although their wheels and other appliances were washed away last winter.

ABOUT HENLEY.—Gillam, Pane & Co. are building a house on their claim, and getting ready to commence work on their mine. Jillson & Co. have their mine in fine condition for working, and have already commenced to pipe and tear away the deep gravel. If the coming winter is favorable for water they will take out gold by the pound. The Black Jack Mining Co. will have about 100 tons of gravel hauled to Jacob & Coyle's mill next week, to be crushed. We have strangers with us almost every day looking at our mining interests, which shows that the locality is attracting the attention of mining men and capitalists.

Tuolumne.

HOMER DISTRICT.—*Index*, Oct. 27: The hullioo from the last cleanup of Clifton ore was worth $17 per ounce. There are but two or three idle men in camp. There ought to be a 30-stamp mill in Lake canyon. There is ore in sight to warrant the erection of such a plant. There are signs that something will happen in Homer district before a great many months have elapsed. In other words, Lundy will be a lively little camp.

NEVADA.

Washoe District.

CON. CAL. & VA.—*Territorial Enterprise*, Nov. 2: 1200 level: Continue the extraction of some milling ore along the line of the north drift. 1300 level: Ore of a fair quality is still being extracted from the junction with the upraise. 1500 level: Ore extraction continues on this level north and south from the upraise connection with the drift northwest from the old stopes. 1600 level: Have continued to extract ore along and above the line of the drift run east through the old stopes on the sill floor of this level. We are also working southerly from this drift stoping out ore. 1650 level: During the week we have taken out ore of the usual quality and quantity. North lateral drift from the Con. Va. shaft has been extended 216 feet. East crosscut has been extended to 77 feet connecting with the northwest drift from the C. & C. shaft. There has been extracted during the week from all parts of the mine 1596 tons of ore, which was shipped to the Eureka mill. Battery sample assays show an average value of $24 per ton; 1590 tons milled.

OPHIR.—On the 1300 level prospecting northwesterly from the winze, 108 feet below the sill floor of the 1300 level, has been suspended and, at a point 122 feet below that level, a west drift has been run 14 feet in low-grade quartz.

SIERRA NEVADA.—The southwest drift started on the 630 level has been advanced 62 feet in a soft porphyry formation showing some seepage of water.

UNION CON.—East crosscut No. 2 from the north lateral drift, 1465 level, extended 25 feet; total, 185 feet, ending in hard porphyry.

MEXICAN.—On the 1465 level the new winze has been sunk 15 feet during the week—total depth 80 feet. Bottom in hard porphyry and work suspended.

OCCIDENTAL CON.—The stopes on the 350, 400 and 450 levels are yielding 45 tons per day of fair-grade ore. The crosscut from the bottom of the winze at the 650 level is in 17 feet; formation, quartz and porphyry, showing some value. During the week the mill has worked 308 tons of ore of the average value of $21 per ton.

BELCHER NO. 1.—Usual amount of work done in various drifts and stopes. The top of the 300 stope still contains streaks of good ore. Shipped to the Vivian mill during the week 285 tons of ore, average battery assay of which was $25.67 per ton.

CROWN POINT.—Nothing new to report of the stopes. Shipped to the Mexican mill during the week 391 tons of ore, the average battery assay of which was $16.63 per ton. In Challenge Con., Seg. Belcher, Overman, and Con. Imperial, work of exploitation is being advanced as usual. Some fairly good ore is being developed in these mines, but none extracted or sent to mill.

GOULD & CURRY.—The northwest drift on the 200 level has been extended to 62 feet; formation, low-grade quartz. On the 400 level, from the old stopes have extracted 40 tons of ore. Car samples assay $23.50 per ton.

BEST & BELCHER.—On the 800 level the north drift has been cleaned out and repaired 140 feet; total distance 500 feet. West crosscut No. 2, 180 feet north of the south line, has been cleaned out and repaired 100 feet. On the 1200 level west crosscut No. 1, 45 feet above this level, has been extended 10 feet; total length, 122 feet; formation in face barren quartz.

ALTA.—Worked past week 315 tons of ore, the average battery assay of which was $19 a ton. The prospecting work in the raise above the 725 level looks well. The stopes on the 825 level are yielding as usual.

YELLOW JACKET.—Shipping 78 tons of $18 ore daily to the Brunswick mill, and doing extensive prospecting work throughout the mine.

ANDES.—During the past week good progress has been made in the north drift from west crosscut No. 1; formation, clay, quartz and porphyry. In the south drift from west crosscut No. 1, the usual progress has been made through quartz and porphyry.

SAVAGE.—Extracting ore from the 500, 600, 750 and 1300 levels. During the week have hoisted from these levels 757 cars of ore. Shipped to the Rock Point mill 385 tons and to the Mexican mill 500 tons; average battery assays, $20.35 per ton. Bullion on hand, $43,000. The southeast drift on the 1300 level advanced 22 feet, face in low-grade ore.

HALE & NORCROSS.—Usual progress reported in the several mine workings. Still repairing the incline and north compartment of the vertical shaft and will soon be able to run the incline machinery and resume work below the 1300 level.

CHOLLAR.—The raise from the 850 level is up 54 feet in hard porphyry. We are cutting out a chute at the 1300 level for prospecting purposes. The stopes are yielding the usual amount and quality of ore. Extracted and sent to mill 494 tons of ore; average battery assays, $18.06 a ton.

WARD COMBINATION SHAFT.—East drift from the 1800 station is out 640 feet; face in quartz and porphyry.

POTOSI.—East crosscut 160 feet north of the winze 1030 level is in 160 feet; face in quartz and porphyry giving low assays. The south drift from the winze station, 1130 level, is in 100 feet, face in bunches of ore. South drift from the main incline is out 560 feet; face in porphyry.

SILVER HILL.—Drifting on the 160 and 334 levels in hard porphyry.

KENTUCK.—The 1000 level east drift has been extended 10 feet; total length, 137 feet; face in porphyry. It is the intention to connect this drift with one now being run from Crown Point. Face of west drift on same level is in a mixture of clay and quartz. The south drift on the 950 level is out 11 feet in low-grade quartz.

JUSTICE.—Have started a north drift from the 822 level station to connect with the bottom 622 winze; face in hard rock. Face of north drift, 622 level, is in low-grade quartz. Face of north drift, 570 level, is in clay and porphyry. Shipped 168 tons of $22.46 ore during the week.

UTAH.—725 level—The main south drift has been extended to 713 feet; formation, porphyry.

CONFIDENCE.—General repairs throughout the mine preparatory to prospecting for ore are still going on.

KEYES.—Two new hoilers are being put in and the machinery arranged for active resumption of work in the mine.

SCORPION.—Southwest drift on the 600 level still running in porphyry with clay seams, showing no change.

ALPHA.—East crosscut, 600 level, is out 126 feet, face in quartz, giving fair assays.

EXCHEQUER.—Drifting and crosscutting on the 500 and 600 levels making good progress; faces in quartz, clay and porphyry.

CON. NEW YORK.—Drifts north of the 650, 800 and 1100 levels running in porphyry, except the latter, which shows a little poor quartz in its face.

Hawthorne District.

THE MOUNT DIABLO.—Walker Lake *Bulletin*, Oct. 29: Following is Supt. Shockley's weekly report of operations at the Mount Diablo: The east drift seventh level is in 295 feet. The east drift on sixth level is in 633 feet, and connected with the winze from the intermediate above. The main stope between fifth and sixth levels shows 3 feet of $60 ore. The east drift on fifth level is in 722 feet. The east stope on this level is giving considerable of $60 ore. The stope west of the shaft on this level is giving some $30 ore. The east drift on intermediate between fourth and fifth levels is in 73 feet, showing bunches of low-grade ore in the face. We have resumed driving the west drift on third level. The north crosscut on this level east is in 117 feet. The intermediate stope above the second level west is giving considerable of $50 ore. The north crosscut from this level east is in 45 feet. The intermediate drift between first and second levels east is in 262 feet. The stope on this level is giving considerable $40 ore. The west drift from Mount Diablo adit is in 96 feet. We are taking out considerable of $30 ore from the surface.

HOLMES MINE.—Nine bars of bullion, valued at $12,000, were shipped below yesterday from the Holmes mine, and four bars, valued at $5000, were shipped from the Mount Diablo mine. The Holmes Mining Co. paid out $35,500 in miners' wages on last month's account.

VARIOUS MINES.—Nat Norton is working a claim near Ed Willis' ranch, East Walker river, which promises well. He has an eight-inch vein of gold ore which averages $30 per ton. He has 14 tons extracted, which is now being worked in an arastra. We are informed that Martin Brazzanovich has discovered a ledge of copper ore varying from four to six feet wide, near Sodaville. The ore is reported to carry about 30 per cent copper and about $20 per ton silver. The demand for copper is steadily increasing and this mine is likely to prove of great value. G. C. Fish has a most encouraging prospect in the Ida mine at Garfield. He has been digging away into that district for three years and deserves a little streak of prosperity.

CANDELARIA'S PROSPECTS.—Col. Wm. J. Sutherland left for London during the week, after a flying visit to the mines under his control at Candelaria. He will arrive in England in time to attend the annual meeting of the Doris syndicate, but it is difficult to fix the date for his return. The Holmes and Princess mines are looking remarkably well just now, with more ore than can be handled with the present milling capacity. A fine new 40-stamp mill will be erected immediately, close to the town and directly below the Holmes mines. It will be as complete as money can make it in every particular. A fine body of ore is exposed in the Georgeoe mine, and a tunnel now being run from the Holmes into the Enterprise (a recent purchase has cut a ledge of high-grade ore, which leaves no doubt as to the value of the latter ground.

White Pine District.

NEW RATE ON ORE.—White Pine *News*, Nov. 1 The Southern Pacific Co. has issued a rate on ore, when actual value does not exceed $30 a ton, of $3.1 per ton from Elko to Ogden, when destined to Salt Lake City. Cars to be loaded to market capacity. This rate also applies to ore shipped from Gerald and Battle Mountain. J. B. Williamson received word yesterday that a rich strike has been made in the Chief of the Hill mine at Cherry creek. Silver ore assaying $500 to the ton has just been struck in one of the company's mines at Ione, Nye county.

ARIZONA.

AROUND GLOBE.—*Silver Belt*, Nov. 1: Work on the copper and silver mines of Globe district is being energetically prosecuted. New silver claims are being prospected and the production of silver increased. The outlook is certainly encouraging and there is growing activity in every other industry, which, after all, are dependent upon the prosperity of our mines. The Quartet M. Co. is meeting with excellent success in the operation of its mine and mill. The mill has been running on custom ore and the result in every instance has been satisfactory to the owners of the ore. Ore from the Co.'s mine, the Loco, is now being worked, and a bar of bullion was shipped this week, and the company expects to make regular weekly shipments in the future. An important strike was made in the Loco last week, the ore assaying from $100 to $350 in silver per ton. The Loco promises to develop into one of the best silver mines in Globe district.

TURQUOISE DISTRICT.—Tombstone *Prospector*, Nov. 1: Si Bryant returned from El Paso yesterday, where he went with three carloads of ore from his Turquoise mine. One carload was sampled and returned him $2136 after paying freight and working charges. This exceeded his most sanguine expectations by $15 per ton. The cave recently struck in his mine is said to be a grand sight, and the beauty of it is that it shows up hundreds of tons of ore like the sample spoken of.

BRADSHAW DISTRICT.—Prescott *Courier*, Oct. 29: Messrs. Jackson, Marx and Carnes, just from Bradshaw district, give good reports of mills and mines. There are 110 men at work building a wagon-road from Phœnix. The Venetian mine, an extension of the Crook, is paying handsomely.

BRITISH COLUMBIA.

HOT SPRINGS.—Nelson *Miner*, Oct. 18: From this district little of interest is reported, other than that difficulty is encountered in procuring animals to pack shipping ore from the mines to the landing at Ainsworth, the owners of pack-trains refusing to do the work at the rates offered. Dr. Campbell, manager of the Revelstoke Mining Co., is now the ground making preparations for carrying on work at the United and No. 1 during the winter. The wagon-road will be extended from the Krao to the United, a distance of half a mile, so that ore can be hauled to the landing for transhipment to Revelstoke in the spring. A suitable ore-shed will be erected at the landing, if terms can be arranged with the owners of the townsite. On the United, a station will be put in at a depth of 50 feet, and a drift run on the ledge in both directions. If this is done the water can probably be handled this winter without the aid of machinery. The Best smelter was to have made its first trial run on Friday. A test was made the fore part of the week on a small quantity of picked specimens, the result being in every way satisfactory. The delay in making the trial run is said to have been occasioned by the refusal of the owner of the pack-train at Ainsworth to pack ore at the price offered, and by the refusal of prominent claim-owners to furnish ore.

TRAIL CREEK.—From this locality news comes in a roundabout way that a Mr. Dwyer, who visited the camp to make an expert report for Seattle parties, says its ore bodies are equal, if not far ahead, in quality to those in Toad Mountain and Hot Springs districts. From a 500-pound sample he had assays of $147 in gold. There is said to be much activity in the camp, and miners are making quite extensive preparations for the winter.

ON GOAT RIVER, ROVER AND EAGLE CREEKS. The more work done in Goat River district the better the showings. Among the owners in its prospective bonanzas are Jap King, Capt. Hayward, J. C. Rykert Jr., George Francis, Thomas Shearer, George Barnes, Dr. La Bau and the Petty brothers. On Rover creek the owners of the Whitewater are more than jubilant; they are millionaires. They claim to have one of the richest properties in Toad Mountain district; and if many tons of ore are in sight as good as the specimens on exhibition at Nelson, their claims are based on a pretty solid foundation. The free gold is found in rose quartz and in oxides of iron, the sulphuret ore being but a small percentage of the total. Recent assays by Ellis of Nelson gave $204 in gold and $24 in silver to the ton. The ledge is from 2 to 6 feet in width. A prospecting mill will, without doubt, be placed on the property at an early date. On Eagle creek work is reported entirely suspended at the Poorman, owing to a scarcity of water. The Wild Cat, Keefer & McCrea's promising prospect, is looking way up, and way-up figures would have to be offered for it by intending purchasers. The Chicese placer-miners on Bird and Jay creeks are taking out good pay, as is proved by the amount of dust sold to their "tyhee" in Nelson.

DISCOVERY OF PLACERS NEAR PASCO.—Okana-

gan *Outlook*, Oct. 17: A dispatch from Pasco dated Oct. 6th says: Intense excitement prevails among residents of this city over the discovery of placer mines three miles from town on the Columbia river. The mines turn out gold at the rate of from 2 to 5 cents a pan, and old miners assert that they can do better. A company is being organized to-night and the work of development will be pushed rapidly. Over 20 claims have already been taken, and it is expected that 200 will be taken by to-morrow evening. People are leaving town to-night to locate upon claims. Assayer Larkin pronounces the gold of the finest quality.

CLOSED DOWN. — The superintendent of the Arlington mine received instructions Monday to close down the mine. The why and wherefore of this termination of operations deponent knoweth not, but it is in harmony with previous manifestations of eccentricity on the part of the company, and creates not a particle of surprise and very little comment from those familiar with its history.

COLORADO.

ASPEN MINES.—Aspen *Times*, Oct. 26: The mining outlook in the Tourtelotte park was never as bright as it is to-day. At all points the old mines are looking well, and a number of new strikes have been made recently that are of the greatest importance. That section is producing steadily and heavily, and there is every prospect that this will be continued indefinitely. To give an idea of the condition of the industry there, the following resume of the more important features is given.

GOOD THUNDER.—A big strike has been made in the Murphy lease on the Good Thunder.

EDISON NO. 2.—In the central section of the Edison, known as the Edison No. 2, a large body of ore is showing.

THE JESSIE.—Some weeks ago Thomas Ogburn concluded to do some prospecting on the Jessie and started a drift off south from the tunnel. This at a distance of 50 feet has passed into a genuine ore chute that is a wonder. There is ore everywhere and no sign of a wall on either side. The ore is heavy in lead and rich in silver.

STRIKE IN CONUNDRUM.—Word was brought down yesterday of a big strike in the Conundrum. This has been made in the Vulcan tunnel on the Grand Union Group owned by Captain S. Q. Carey, A. J. Pickerell, Thos. Ogburn, and others. The discovery of rich ore in this property is not a surprise, but it has been found in an unexpected quarter. The mineral averages up close to 100 ounces and there is ore everywhere in the works.

THE O. K.—This mine is now in far better shape than it has been at any previous time.

LAST DOLLAR.—The Dollar long ago made its reputation, but this is being added to by recent developments. The property is increasing in value all the time and is one of the big things of the State.

HIGH GRADE ORES.—Georgetown *Courier*, Oct. 25: Phil Sheridan had a test millrun from the Ben Harrison lode Thursday, which returned 240 ozs. silver. The ore also carries quite a large per cent of lead. John Frazier is stoping on a small vein of good ore on his Black Prince, which according to a millrun had this week returned 242 ozs. silver to the ton. Silas Durkee & Co. have a vein of solid ore 12 inches thick in their working on the Johnson. A millrun of seven tons had this week returned $95 to the ton.

DAKOTA.

MINE AND MILL.—Deadwood *Pioneer*, Oct. 31: All the men and teams engaged in breaking ore at the Golden Reward and hauling it to the reduction works, were laid off yesterday, there being a sufficient quantity of ore to last until spring. A rich strike has been made in the Gold Bank mine at Mineral Hill, some of the ore assaying $3000 per ton. The vein is a fissure running down through the porphyry, and carries free gold. The rich streak is in the center of the vein and is only a few inches wide, but the rock on either side for a distance of four feet runs heavy in gold. Titus Corkhill brought over two specimens last night that under a glass were alive with free gold. The find has created great excitement among the miners of Bear Gulch. A force of men is at work on the Maggie mine at Ruby, taking out a high grade quality of ore. Joseph Swift, on his recent visit to the mine, expressed his satisfaction at the showing made. The Double Standard is shipping ore daily to Omaha over the B. H. & Ft. P. R. R. A carload is gotten out every two days, and the grade of ore is about $50 per ton.

IDAHO.

KOOTENAY COUNTY.—Boise *Statesman*, Oct. 26: Among the many excellent mining claims in Granite creek district, Kootenay county, may be mentioned the Montana, Idaho and Nevada. The veins are large and well defined on the surface, and as depth is attained the veins are widening. A large force of men has been kept constantly at work for several months, and as a result, the vein will average from 7 to 9 feet in width of silver-lead ore which assays from 150 to 350 ounces in silver per ton, 35 to 40 per cent in lead. These three are the best developed claims in that district, and every shot put in has demonstrated the greater value of the claims.

CŒUR D'ALENE.—Wardner *News*, Nov. 1: Work is being pushed vigorously throughout all portions of the Cœur d'Alene country. The developments made during the past season in the Poorman mine, place that property on a par with the best ore-producing mines in the country. The best evidence of its value can be found in the words of its superintendent, Mr. P. Clark, who says he will produce $70,000 in lead and silver this month, and pay a handsome dividend as well as $3.50 per day to a force of over 200 men.

LALANDE DISTRICT.—A rich strike was lately made in the Hunter mine, a large body of ore being encountered in tunnel No. 4. The ledge is 18 feet wide of good concentrating galena ore. Lalande district is daily adding to its reputation; many new producers will be added to the list in the near future, as some of the shafts now being sunk cannot fail to open up large bodies of ore.

YREKA DISTRICT.—The Last Chance Mining Co. on last Monday commenced excavating preparatory to starting their long tunnel which is intended to tap the lode at a depth of 900 feet from the surface and about 420 feet below the present workings. This tunnel when finished will be 2600 feet long, 7 feet high and 10 feet wide; it will contain double tracks allowing cars to pass each other, thus avoiding all delay in getting out the broken material. Supt. Charles Sweeny expects to have this mammoth work completed in 12 months. The company has 85 men on its present pay-roll, 65 of the number being employed in the mine and mill and 20 on the tunnel. The concentrator is running day and night.

LOWER CALIFORNIA.

IRON MINES.—*Lower Californian*, Oct. 23: M. D. King, superintendent of the Tepustete iron mines at San Isidro, says that the mines are among the largest on the continent. He has spent the last few months thoroughly prospecting the property, as the company wished to understand the full extent of its possessions before expending the large sums necessary to develop them. Mr. King thinks that it is the most valuable property on the Peoinsula of such a character.

THE SUENYO MINE.—D. M. Smith, late of Alamo, has secured a large interest in the rich Suenyo mine south of Tia Juana. A large force of men will be put at work developing the property.

MONTANA.

NEW SMELTING WORKS.—*Mining Review*, Oct. 29: The Helena smelter started up last week with over 100 men and ore enough to run two furnaces. It was expected that another furnace would have been started this week, but the accident on the Boulder branch of the Northern Pacific prevented the delivery of ore engaged, and the firing of the furnace will necessarily be postponed until trains can pass over this line. The smelter people hope soon to have the works running at their fullest capacity, when over 200 men will be employed, and 200 tons of ore reduced daily. In the Bald Butte, near Marysville, it is reported that a six-foot vein of free-milling gold ore has been discovered in the new shaft. The mill is in constant operation, and the returns large. The quartz claim of Messrs. Hunter and Fisher, located on Ogden mountain, near Helmville, has developed some very fine ore, and is now considered one of the best properties in that section.

STILL PROSPEROUS.—The Butte *Inter-Mountain*, Nov. 1, says: There has been no break in the prosperity of this camp during the past week. The steady advance of the year has been maintained and almost every day has chronicled its new improvements or a strike of more or less value in some of the many great properties making up the district.

IMMENSE IF TRUE.—Montana *Journal*, Oct. 29: It is said that the Cumberland, at Castle, has, by actual measurement, 450,000 tons of ore in sight, of an estimated net value of $50 per ton. Were the Cumberland in Leadville its stock would be quoted at $10 per share. In Montana it is a slow seller at $3.50.

NEW MEXICO.

ABOUT SILVER CITY.—*Sentinel*, Oct. 28: It is authoritatively stated that the contract has been let for a 100-ton concentrator to be erected at San Pedro at once by the Santa Fe Copper Co. Sec'y Thomas has let the contract for $3000 worth of improvements on the old Government palace at Santa Fe. We are informed by Lawrence Ryan that the Kinney Bros. have struck another bonanza on one of their claims joining the Log Cabin on the west, which looks better than any heretofore struck in that section. They are now down 30 feet, being in ore almost from the surface. Some of it samples 6000 ounces in silver and $500 in gold. The strike is in a lime formation, the ore being in quartz and talc, full of chlorides and sulphides.

SOUTH DAKOTA.

ONTARIO.—Deadwood *Pioneer*, Oct. 26: John Gerkins, who came over from Galena, Wednesday, reports everything progressing smoothly at the Ontario. As the main tunnel progresses the ore becomes richer, and they now have a good body of gray carbonate that will go 30 per cent lead and 60 ounces in silver.

GOLDEN REWARD. — The Golden Reward has upward of 2500 tons of ore at the reduction works, and is daily adding to the pile. The chlorination process is proving a decided success.

UTAH.

STRIKE IN THE MORMON CHIEF.—*Tribune*, Oct. 29: A few days ago the *Tribune* told of a body of quartz having been struck in the shaft of the Mormon Chief out at Tiotic. Now comes the good news that on Tuesday a body of galena was tapped below this quartz, but it is not known to what extent. This gives promise of making the Mormon Chief a big property in the near future.

A GOOD CLAIM.—The Dewdrop has a 16-inch vein of ore that assays 60 ounces in silver and 40 per cent lead. It is a promising claim and is in a splendid locality.

OZOKERITE.—Yesterday a party of gentlemen were busy organizing a company to develop mineral wax deposits in the Castle Valley country, and also engage in manufacturing this wax into paraffine, etc., the factory to be located in this city.

FINE ORE.—The *Tribune* was yesterday shown an assay of ore from the Copper Queen, near North Ogden, which was 3.4 ounces silver and 6.6 ounces gold, a total value of $132 per ton. This is a new and promising prospect, owned by Hutchinson & Noah. It has a 40-foot tunnel, and the face shows eight feet of ore.

A RICH STRIKE is reported in the Sampson at Bingham, adjoining the Yosemite.

THE DEEP CREEK COUNTRY.—*S. E. Journal*, Oct. 29: A great many prospecting parties have been sent out into the Deep Creek country by our business men. If all are successful, a great deal of wealth will be added to Zion, as the fine, large blocks that adorn our streets are, as a general rule, the results of mining ventures.

AMERICAN FORK.—Mining matters are beginning to brighten up in the vicinity of American Fork. When the mines up the canyon begin heavy shipments again, it will be necessary to rebuild the railroad that once furnished transportation to the famous Miller and other American Fork canyon mines.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

	Cash.	Debt.
Alta	*$38,227	$.....

* Collecting assessment.
† Bullion $15,532 not included.
‡ Mines expenses and bullion returns not included.
†† Overdraft at bank $134,059, unsold bullion $326,254. Mine expenses and more bullion shipments to be heard from.
†† Bullion to arrive will cancel indebtedness and leave a cash balance.

Mining Share Market.

Mining shares the past week ruled dull on Friday and Saturday, but on Monday opened strong and higher under the leadership of the middle stocks—Potosi scoring an advance of $1.75 a share. Since then prices have hung around at a slight decline. The dull trading and hanging of prices cause many well-informed operators to look for a sharp set-back before another up move is made. The decline will be made to uncover margin stocks. Reliable advices from the mines do not warrant lower prices but everything to encourage the belief that better prices will prevail. The mill ring appears to be fighting against higher prices, and also against any movement calculated to bring about a reform in mine management. In outside shares the Tuscaroras and Quijotoas ruled extremely dull at blackboard prices; but the Bodies shaded off and that, too, in the face of the best of advices from the Bodie and Standard mines. Mt. Diablo and Eureka have held fairly steady.

A telegraphic report came to hand from Carson City that the Comstock Tunnel Co. had agreed to place the royalty on ore to four per cent of the bullion yield. As the tunnel property is in litigation, this goes for naught until the courts decide which company—the Sutro Tunnel Co. or Comstock Tunnel Co.—are owners of the property. But, not taking the ownership into consideration, four per cent royalty is a reduction on all ore going below $50 a ton, but an advance on all going above that figure. If the present royalty was cut just half in two, the rate would give much better satisfaction.

When the Billy Brown party surrendered the control of the Andes Mining Co. there was over $17,500 in treasury. On Nov. 4th the company reports a little over $14,500 in hand, a decrease of about $3000 in less than a fortnight, and no more men at work. At that rate, the company will get away with fully $75,000 a year.

The market opened this (Thursday) morning dull and weak under a report of lower prices. After Call, prices shaded off some, but toward noon they showed a better tone. In outside stocks, Bodie sold down to $1.75. Those in position to know affirm that strong buyers have been taking Bodie and Mono during the late decline.

News from the Comstocks report an important development in Potosi, causing a more hopeful feeling among insiders. The development is both north and south of the winze. Advices from other Middle mines are of a very cheerful character. From the Gold Hill mines important work is going on and good results are looked for any day, particularly if the manipulators corner the stock market. From the North End Mines our advices are of a very encouraging character, but more deadwork is necessary. In West Con. Virginia they are prospecting the upper levels, while preparing to sink the shaft to the 800-foot level, so as to tap the ore body tapped in the west workings of Con. Virginia. In the Alta group good results are expected from the prospecting work now under way.

From the outside mines our advices are of the same favorable character heretofore made public regarding the Tuscaroras and Quijotoas. Dividends are expected to be paid by one or more of the Tuscarora mines at an early date. From Bodie our advices are of a still more favorable character and do not warrant the break in prices. The work indicates close proximity to one of the rich pockets for which that mine is noted. The battery assays of the ore milled in about $50 a ton. It is said that the next bullion shipment will be considerably larger than the last. The news from the Standard mine reports very important work going on.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING OCT. 28, 1890.

439,469.—CULTIVATOR — H. S. Brink, Biggs, Cal.

439,321.—MACHINE FOR CUTTING BOARDS—J. B. Burrell, Wrights, Cal.

439,110.—TRANSMITTING POWER — E. Chaffey, Santa Monica, Cal.

439,148.—PUMP VALVE — L. Dahlstrom, Santa Clara, Cal.

439,140.—CLUTCH PULLEY—J. C. Gibson, S. F.

439,503 —BURGLAR ALARM— J. J. Grillith, San Bernardino, Cal.

439,403.—SEAT BACK—S. C. Houghton, S. F.

439,299.—CUFF-HOLDER—A. A. Lomont, Santa Rosa, Cal.

439,250.—CLOTHES-PIN—G. W. McCord, Baker City, Ogn.

439,421.—AIR SHIP—P. W. Nahl. S. F.

439,325.—VEHICLE SEAT—D. F. Oliver, Oakland, Cal.

439,550.—LEAF-TURNER—J. E. Pellow, Sierra City, Cal.

439,224.—SHINGLE MACHINE—D. W. Williams, Fortuna, Cal.

439,336.—COMBINATION TOOL—Geo. Zitlow, Tacoma, Wash.

The following brief list by telegraph, for Nov. 4, will appear more complete on receipt of mail advices:

California—William H. Anderson, Riverside, treadle pump; John W. Crites, S. F., mining; Owen T. Davies, Brighton, combined ditcher and cultivator; James B. Dean, Lompoc, and H. H. Earl, S. F., brush attachment for dustpans; Adolf Fritsch, Suisun, cigar or cigarette-holder; Louis Gottstone, S. F., street or station indicator; Charles D. Kennedy, California City, machine for making shells; William A. J. Kohrn, S. F., telegraph key; William Maybury, Pasadena, apparatus for drying, bleaching and washing yarn; Horace D. Ranlett and G. Provost, S. F., device for operating shutters for elevator shafts; James W. Reid, S. F., discharge attachment for wash basins, etc.; Percy W. Rose, Los Angeles, car-coupling; Frank Sharon, S. F., hose-coupling; Joseph L. Stillman, Fresno, car-coupling; John Taggart, San Diego, rubber-shoe attachment; Ludwig Wagner, S. F., wine schooner; Alfred M. Whiteley, Sacramento, attachment for chairs; William H. Wiester, S. F., waterback for gas stoves.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE SEAT.—D. F. Oliver, Oakland, Cal., assignor to Truman, Hooker & Co. of San Francisco. No. 439,325. Dated Oct. 28, 1890. This invention belongs to that class in which the seat is pivoted at one end, and is adapted to be turned into a horizontal plane from a position for use to a position out of the way to enable a person to readily enter the vehicle. The invention consists in a novel, simple and effective construction of the pivot joint of the seat, whereby it is readily operated, is locked in either an open or closed position, and is fully supported during its turning.

CLUTCH PULLEY.—James C. Gibson, S. F. No. 439,140. Dated Oct. 28, 1890. This invention is an improvement in belt pulleys for driving machinery. The pulley consists of a rim without a central hub, means for connecting said rim with the driving shaft or disconnecting it therefrom, so that it will remain stationary, and means for supporting said rim when disconnected from the driving shaft. More particularly speaking, the pulley consists in connection with a rotary shaft having a hub secured to it, radial guides from said hub, arms sliding radially in the guides, levers fulcrumed to the hub, and having one end connected with the sliding arms and the opposite end connected with the clutch sleeve, a means for moving the sleeve longitudinally on the shaft so as to actuate the levers and arms, and clamping segments fixed to the outer ends of the arms, said segments being adapted to clamp an interior flange on the pulley rim so as to unite the rim with the central hub and cause it to be driven thereby.

ADJUSTABLE SEAT-BACK.—Stephen C. Houghton, S. F., assignor of one-half to D. C. Branch of same place. No. 439,403. Dated Oct. 28, 1890. This invention, though applicable to any chair or seat requiring an adjustable back, is particularly designed for use in connection with piano stools. The invention consists essentially of a back connected with the stool by a hinge joint, and a thumbscrew and nut whereby the back may be turned upon its joint to be accurately adjusted to and held securely at any inclination desired. The back can be readily connected with and disconnected from any stool, and its inclination easily and accurately determined and securely maintained.

FRUIT-DIPPING APPARATUS.—David D. Jones, San Jose, Cal., assignor to W. C. Anderson of same place. No. 439,072. Dated Oct. 21, 1890. This apparatus is intended for the dipping of prunes, first into lye water and then into clear water, previous to drying. It consists of two tanks, one for the lye water and the other for the clear water. In each is a swinging dipper having a foraminous bottom, and these dippers operate alternately, the first discharging its contents into the second and the latter discharging the fruit upon a vibrating tray upon which the prunes spread themselves evenly and so which they are carried off to dry, a fresh tray being substituted.

MECHANICAL PROGRESS

Mechanical Evolution.

The term evolution is nowadays employed to denote a slow, progressive unfolding, or growth, and describes in a very complete way the history of all important machines and processes in industrial development. This evolution is not an ideal matter; on the contrary, it is a business one that must be taken into account the same as taxes or an expense account. Every improvement of any importance comes down to a standard of "common practice" through a course of evolution.

At the present time we are busy with steam expansion; double, triple and quadruple engines with high boiler pressure. If one looks back for half a century, the evolution of this matter assumes a tolerably regular sequence, not so much of discovery as adaptation. It is a quarter of a century since Perkins began his experiments with high-pressure steam. Wolff, much farther back, introduced the second cylinder. Sixty years ago regular compound engines were made and fitted into steamers in Holland. The drawings of these engines have recently been reproduced in England and published in the *Engineer*.

On the Ohio river 40 years ago there were compound engines. The Hawkeye that was sunk about 1848, by her flywheel breaking, had compound engines. The Clippers No. 1 and No. 2, lasting from 1846 to 1856, had compound engines, set tandem; so had the Memphis, a New Orleans and Cincinnati packet, 35 years ago. Her engines were about 16 and 24 inch bore, the cylinders set tandem. They were called then Clipper engines, from the name of the first boat fitted up in this manner on Western waters, and were in all essential respects the same as compound engines are now made. The pressure employed was nominally 150 pounds per inch, when the "chief" did not hang too much weight on the safety-valve. In that case the pressure was uncertain and rose rapidly if an opposition boat was seen ahead.

It is more than 15 years since John Elder of Glasgow was in the heat of battle with his competitors over the compound-engine problem, and it is ten years or more since Mr. Galloway of Manchester, England, constructed a quadruple-expanding engine for a cotton-mill there, and was laughed at for committing such a vagary. The rule of "evolution" in such things is inexorable. There is no escape from it except on the principle of "proceeding in haste and repenting at leisure."

Mr. A. S. Hallidie's first cable railway in San Francisco was constructed in 1873, seventeen years ago. Since then there has been concentrated on this subject the best efforts of our ablest engineers, spurred on by the incentive of a great public want and ample facilities. Now at the end of this time we find ourselves changing, modifying and improving with scarcely one feature or detail settled in a definite way. A new type of cars is just being tried, a new system of turn-tables has been adopted, the traction gearing is widely varied, the cable conduits are taking various forms, and little of the old appliances remain. We can see many years more of evolution before the cable system of propulsion assumes what is called standard practice.

Some of our older mechanics can remember something of the evolution of so simple a thing as the monkey-wrench or "screw-key" or "screw-spanner" as it is called in England. This very useful implement came into use about 40 years ago and met with wide acceptance, but no one knew how to make such things at a reasonable cost with the strength required to withstand rough use. The monkey-wrench, after a successful career of a few years, came very near passing out into oblivion again, and deserved to, for, as a steamboat engineer once remarked, "he did not dare leave port without a box of them." The Coes, at Worcester, Mass., saved this implement by commencing its manufacture in an honest manner, substituting wrought and malleable for cast iron, and otherwise making it a strong, convenient tool. The period of evolution was 20 years or so for this little implement.

The constructing engineer who has "come to older years," as the great Vasa called it, makes constant use of the evolution theory as it applies to arts and manufactures. The margin allowed cannot be computed with certainty, but must be estimated in some way. The sanguine inventor ignores the whole matter; so too does the sanguine investor sometimes. The college man thinks the theory of evolution a rebuke to computed results, but evolution keeps on in its quiet course demanding its proportion of time, effort and loss.

We derived some pleasure once in tracing the evolution of a peculiar kind of boats employed by the Scandinavian fishermen in the North sea. These boats with their rigging have come down through at least a thousand years of experiment, and one can find no detail of them that is a result of modern inference or invention. Old men can remember when a few things were different, but not much, from present methods. Those in the Skargord (rock garden), as the middle Swedish coast is called, are of wide beam, very strongly built, on the clincher system. The keel is very deep in the center and is no longer than the beam, is in effect a fixed center-board. The boats are always rigged so as to carry a strong "weather helm," and will turn as though on a pivot. The cause of this is traceable to the granite crags that are everywhere beneath the surface of the water. A helmsman has to see these in the clear water and turn within a boat's length to miss them. Provision for meeting the sudden squalls that come out of the gorges and canyons is seen in the methods of rigging these boats; in fact, every novel feature can be traced to some circumstance of peculiar use, which no one of our day, or any other day, invented at one time or without a train of experiments.

Going north or south, one finds the fishing craft modified to meet the circumstances. On the Norwegian Coast the boats are quite different—sharp at both ends and with a great deal of "sheer." To the south the boats are larger as the sound grows wider; lug sails are used and the timbers are not so heavy. One will inquire in vain from the builders of these boats the reason for models, arrangement, or other feature of them. As before remarked, they came from the Viking period; perhaps long before.

The blacksmiths' anvil is another case of evolution. No one of our day can remember much change in this implement. The Tyrians, no doubt, began the development, and down through ages the "survival of the fittest" pointed out the most convenient form. The overhang, the horn, rehate, and swage socket grew by use.—*Industry*.

TEMPERING IN OIL KNOWN TO THE ANCIENTS. The fact that tempering iron in oil was practiced by the ancients is mentioned by Pliny. We also learn from Shakespeare (Bacon?) that the Moors possessed the knowledge of tempering by water at different temperatures if not by different liquids, for he makes Othello say: "I have another weapon in this chamber; it is a sword of Spain, of the ice-brook's temper." Also, Homer in his "Odyssey" says: "As when the smith dips into cold water a great ax or an adze, and it hisses lordly as he is tempering it, for so it is that iron is made hard." Mr. James Riley of the British Iron Institute, in a paper read at the meeting of May, 1889, on the subject of the alloys of steel and nickel, said that continuous research was being made into the matter of tempering iron and steel, and that although the treatment of large masses of steel by tempering, hardening and annealing has been carefully studied for years, still the secret of the behavior of such large masses under such conditions is yet far from being unfolded.

TERNE PLATES AND THEIR ORIGIN.—Charles Thaner, a veteran St. Louis tin roofer, inspector of "terne plates," recently said: "I think they really originated in this country and not in Great Britain, as is popularly supposed. There used to be an old roofer around here who insisted that terne plates were made East more than 50 years ago. I have also seen a published account somewhere of an experiment in Philadelphia with roofing tin, now known as terne, as early as 1830. It was made by hand, and by dipping a sheet of bright tin into a bath of molten lead. Some time afterward the idea of a terne-coated plate was adopted by the Welsh manufacturers, and it was still later that machinery was introduced by them in turning out terne plates. So you see the idea was American, even if carried out by foreign manufacturers. I see the old story of using ternes to make cans is up again. No canner would want heavy coated plates in preference to bright tin. There's nothing in the story, probably; but it comes up every now and then."

CASE HARDENING IRON BY ELECTRICITY.—The old method of case hardening iron, or converting its surface into steel, is done by inclosing the iron in a close iron box with a quantity of burnt leather scraps, honedust, or any other material containing carbon, and subjecting the box for some time to a red heat. The surface of the iron so treated becomes carbonized—converted into steel—and is then susceptible of receiving the finest steel polish. It is said that Prof. Elihu Thompson is credited with a method of performing this work by means of the heat produced by the passage of an electric current. *His* process consists essentially in heating the object electrically, and then applying to the metal so heated a surrounding envelope — either gaseous, fluid or solid—for the purpose of changing or preventing change in the quality of the material, according to the special end to be attained.

TO DETECT FLAWS IN METALS.—We recently referred to a new device called the "echiseophone," used to detect flaws in metals. The instrument is now described by *Nature* as follows: "It consists of a microphone combined with a mechanical striker and a sonometer. In using the instrument one operator directs the striker over the surface of the metal under examination, while another listens at the telephone in an adjoining room. When the striker hits a point over a flaw, the sound is increased, and the increase is so magnified by the microphone that the listener at the telephone can detect its presence. Tests of the instrument were made at Ermont on the rails for the Northern Railway Co., and in every case where a flaw was indicated by the instrument it was found to exist on breaking the rail."

BOSTON is about to try the virtues of fuel gas. The Boston Gas Company, at the North End station, have a plant embodying the latest improvements in the production of water-gas from the cheapest grade of fuel.

SCIENTIFIC PROGRESS.

A Liquid, Volatile Nickel Compound.

Nickel seems destined to startle the world in more senses than one. Its influence as an alloy in steel for ironclads is just now the talk of the mechanical world. Almost simultaneously with the announcement of this remarkable influence of the hitherto little used nickel comes a new sensation which has startled the chemical world also. The *Scientific American* says:

From being a comparative rarity, except on plated goods, it (nickel) became a common laboratory material but a little while ago, then its title to be considered an element was impugned, and now it is both triumphantly reinstated and its vapor density, for the first time, determined. These results have followed from the researches of Mr. Mond and Dra. Quincke and Langer, which were recently made the subject of a paper before the Chemical Society. The investigation owed its origin to the need for removing carbonic oxide from producer gas, in order to use it in the gas battery described in Mr. Mond's presidential address at the annual meeting of the Society of Chemical Industry last year, nickel and cobalt being found to effect this object.

Working in this direction, it has been found that a direct compound of nickel and carbonic oxide, viz., $Ni(CO)^4$, exists, the new substance being a colorless liquid, volatile at ordinary temperatures, boiling at 43° C., having a specific gravity of 3.3185 at 17° C., soluble in alcohol, benzine and chloroform, and not acted upon by dilute acids and alkalies. Its vapor explodes when heated to 60° C. Its vapor density determined by Victor Meyer's method is 6.01, instead of the theoretical value, 5.09; from this, the atomic weight of nickel is found to be 58. The metal itself can be obtained from it in the form of brilliant metallic mirrors of such purity as to form a splendid raw material for the redetermination of the atomic weight. The mean value obtained by reducing nickel oxide from this source by heating in a stream of electrolytic hydrogen was 58.61, corresponding closely with that previously accepted, viz., 58.52. This proves conclusively that Kruss and Schmidt's assertion that the metal hitherto considered to be pure nickel is contaminated with another element, and that all date concerning it consequently need revision, cannot be sustained, and replaces nickel as we have always known it among the elements.

The constitution of the compound $Ni(CO)^4$ is still the subject of the keenest speculation. Mr. Mond declined to be "drawn" on this point, admitting the temptation to represent it by some fascinating ring formula, but contenting himself with a statement of the facts. In connection with this curious body, it is to be noted that no similar cobalt can be obtained, thus establishing another method of differentiation and separation between it and its twin brother nickel.

SCIENTIFIC AND PRACTICAL KNOWLEDGE.—All knowledge is comprised in two classes. The first is that effort of mind which is the result of curiosity; that species of human instinct which prompts us to inquire the reason why everything we see, every action which takes place among others, among all living beings, among the elements, and among the celestial bodies. Mankind being endowed with reason, the next impulse is to apply the knowledge so gained to some useful purpose, to produce some benefit to ourselves. The first of these two classes is called "scientific investigation," the second is called "applied science." For instance, we notice for the first time a light from which smoke arises; we investigate, we perceive heat, and that it produces a disagreeable sensation. These are the first scientific facts; we apply the knowledge so gained by resolving never to touch fire. This is applied science. We have employed curiosity to find out the facts. We now employ caution to guard ourselves against damage, and we determine never to touch fire. All knowledge is gained by this process; we may be told a thousand times that fire will burn, but we feel that that is only theory; we want facts, and we obtain them by a course of scientific investigation. We use these facts and thus gain experience, knowledge, at first scientific, next practical; and these two conditions make up the sum of all knowledge. Science is the foundation, practice the superstructure.—*Ex.*

SINGULAR ELECTRICAL EFFECT.—What may be called a remarkable effect of electric oscillations has been recently pointed out by Prof. Minchin in *Nature*. Two metal plates attached to platinum wires are sealed in a closed glass vessel containing alcohol. One of these plates has been previously sensitized by some process not described, and it is found that if light falls upon this, its potential differs from that of the second plate by more than half a volt, and may be detected by an electrometer. A slight tap will, however, render the cell insensitive to light; a second tap will restore the sensitive condition, and so on—the two states occurring alternately and being indicated by the movements of the needle to and from the zero position. The influence of an electric spark on such a cell is still more remarkable. If the cell is in the insensitive condition, the sensitive state can be at once restored by simply sensing a spark to pass between the terminals of a Wimshurst machine or of a Hertz oscillator. The effect takes place even if the spark is caused at a distance of many feet from the cell. Prof. Minchin explains the effects by assuming that the molecular state of the surface is altered, and he assumes that light energy can be taken up electrically for one condition but not for the other.

THE WATCH AS A COMPASS.—A few days ago I was standing by an American gentleman, when I expressed a wish to know which point was the north. He at once pulled out his watch, looked at it and pointed to the north. I asked him whether he had a compass attached to his watch. "All watches," he replied, "are compasses." Then he explained to me how this was. Point the hour hand to the sun, and the south is exactly half-way between the hour and figure XII on the watch. For instance, suppose that it is four o'clock, Point the hand indicating four to the sun, and II on the watch is exactly south. Suppose that it is eight o'clock, point the hand indicating eight to the sun, and the figure X on the watch is due south. My American friend was quite surprised that I did not know this. Thinking that very possibly I was ignorant of a thing that every one else knew, and happening to meet Mr. Stanley, I asked that eminent traveler whether he was aware of this simple mode of discovering the points of the compass. He said that he had never heard of it. I presume, therefore, that the world is in the same state of ignorance. Amalfi is proud of having been the home of the inventor of the compass. I do not know what town boasts of my American friend as a citizen.—*London Truth*.

ELECTRICITY IN INSECTS.—M. Nicolas Wagner, by a series of experiments displayed before the Academy of Sciences, showed that electricity produced variation in the color of butterflies. His experiments were performed on *Venessa urtica*. He found that electric currents changed reds into orange and blacks into reds, and with a constant battery, a weak current produced spots varying in shape with the strength of the current. He further demonstrated that the colors naturally existing in the butterfly's wings were due to currents in that organ, the most powerful of which passes from the attachment of the wing outward along the middle nervure to the outer edge. In these experiments he used a galvanometer of 20,000 coils. The following are the conclusions he arrived at: 1. The existence of fixed electric currents in the wings of insects. 2. The possibility by means of electric currents to provoke a change in the shade and disposition of the coloring matter. 3. The possibility, by means of these currents, to produce a kind of atrophy and to change the shape of the wings. He concludes as follows: "With these facts as a basis, I propose to pursue my research on this subject."

A REASON FOR EVERYTHING.—Those who understand the principles of Nature will see them working in all things. We see one plant grow luxuriously and crowd others out of existence or into a spindling life. When a plant does not grow properly, there is a reason for it; and when the effect is seen, the cause should be sought for and removed if possible. The same principle is working all around us in business; and if the heads of weakly concerns lack decision and judgment, the gardener will not be made to dig about the plant and it will die. Sometimes a live head will see the necessity of seeking a new gardener. Men, like machines, outlive their usefulness. The one should be broken up, the other sent to a new field of action. The cause of failure is plain to those who possess occult knowledge. Of course no one would fail if he had the power to see why he fails; the cause is occult (hidden) from him, but not from those who possess knowledge. Education counts for little in such matters.

THE VOICES OF THE DEAD.—A contemporary says the phonograph people have a property which grows more valuable with the lapse of every year. Many cylinders are stowed away with marvelously interesting records upon their waxen surfaces. The Gladstone cylinder is exhibited only on rare occasions and to distinguished guests. It is already an extremely valuable record, and at Gladstone's death it will probably be worth $1000. A cylinder containing a few sentences by old Gen. Von Moltke, now 90 years of age, can also be heard. The signalling of a baby can also be taken by the cylinder, and when its producer has reached man's estate he can listen to his own infantile voice if he has any curiosity that way.

AN enterprising electrician speaks confidently of the practicability of a submarine vessel, which he is prepared to take charge of when constructed. His idea is to make the vessel cylindrical, 12 feet amidships, 60 tons weight, carrying 30 tons of storage batteries, and geared by motors to double-acting propellers on a system which he has already applied.

GREAT ENDURANCE OF THE MAXIM GUN.—In some of the enduring tests of the Maxim gun in Germany, 34,000 rounds were fired from a single barrel, 20,000 rounds of cartridges with steel-covered bullets being fired from a single barrel before the rifling was materially injured.

URANIUM was unknown a century ago, but a lode has been found in a mine in Cornwall, England. It sells for $12,000 a ton.

ENGINEERING NOTES.

Tubular Steamships for Ocean Service.

Mr. John Lockie of Leith, Scotland, holds that shipbuilders have about reached the maximum of speed unless there is a decided change in the structural material as ordinarily used. Steel, he says, will break down of its own weight before the possible five-days' passage from continent to continent is reached.

Another builder with the same end in view suggests possible change in structure as follows:

"In shipbuilding, the use of plates, double T beams, angle irons and trough beams has proceeded with mechanical precision, until we have obtained about the limit of capacity, while we have never thought of, or little regarded, the illustrious examples of locomotion and of floating that nature has kept before us in the tube construction of the bird.

"Permit me to suggest that light steel tubing, such as has become a marketable product at low cost under the recent improvements in gas and electric welding, may become a profitable study to the shipbuilder in the construction of the ship of the future. The principle of spiral welding, by which there is at once the greatest reinforcement of material combined with lightness and tightness, accomplishes in its structural quality all that might be claimed for three times the weight in the ordinary forms of material for like purposes.

"The art of welding and the adoption of the spiral, or twisted form, in which material increases both its tensile and resisting qualities, have instituted an entirely new set of mechanical calculations, and are destined to overcome many structural difficulties that have amounted, heretofore, to practical prohibition.

"The spirally welded tube, then, may be set down as a possible solution of the problems of displacement and resistance, up to the five-day limit of speed for the Atlantic liners.

"The tubes not only convey the idea of lightness and strength, but that of safety, for every tube can be securely sealed as an air-tight compartment in itself, while it is acting with all its force in the construction. It is certainly possible to utilize this principle so that it would be entirely impossible, under any ordinary circumstances, to sink a vessel by collision, and foundering would be unknown. Compartments would be useless, as every part of the vessel except the deck floors, partitions and sheathing would be veritable compartments."

The same writer also suggests the possibility that aluminum may, in the near future, form an important portion of the structural material of large and fast ocean steamers by both increasing their strength and reducing their weight. He says: "This famous metal awaits a readier, simpler and more efficient manumission from its chemical confinement. Aluminum must gravitate into the units per cost pound before we can expect much. I look with great expectancy upon this glorious metal, but I am still convinced that the possibilities of steel are yet very, very great, and that, even with steel, five days from port to port may be comfortably realized."

A NEW ERA IN BOAT-BUILDING.—While the railroads have been pressing forward in the matter of improvements, the steamboat-men have been idle and the Western steamer of today is not as good a vessel as that which existed 50 years ago; but, according to a Pittsburg paper, there is about to be a change in the matter of building steamboats that will make the expense of maintaining river craft much less than it now is. The greatest expense attached to the maintenance of a steamboat is in the hull. A new hull and new machinery will work well together for five or six years, but after that time the hull becomes a constant drain on the earnings of the boat, and in ten years the hull is ready to go to the boneyard. One set of machinery will outlast five or six hulls, and the light framework will last as long as two or three. Messrs. A. J. Sweney & Son of Wheeling have taken the contract for the first steel hull steamer ever built to run in Western waters. The boat will be run in the Chattahoochee river. The hull will be built of angle steel, and will have a wooden "skin." It can be put on the docks and a new hide put on at any time without disturbing the framework, and if deemed advisable, can be covered with steel plates. The boat will be lighter than the common wooden boat, and will cost about half as much more than a wooden boat. Steel angles are continually growing cheaper and timber for such purposes is at the same time getting scarcer and dearer, so that ere long the steel boat will be as cheap as the old wooden affair.

THE FASTEST STEAMER on the Fall River line is the Plymouth, recently built. Her engines have no working beam, but are horizontally inclined with cranks directly connected with the wheel shaft. Her paddles are feathered. She works steam at 160 pounds, with a triple-expansion engine of 5000-horse power. She makes 20 miles an hour. Her speed is all that was anticipated, but is quite short of the famous Isle of Man boats after which she was, in a measure, modeled. These boats make 25 miles an hour, but they are shorter and narrower, while their engines indicate 6000-horse power. They are compound, using steam at 125 pounds pressure. The high-pressure cylinder is placed on top of the low-pressure cylinder, but with a less incline and approaching nearer together toward the single crank to which they are connected. Feathering paddles are also used, as is almost universally the case in England.

GOOD HEALTH.

Dying Usually a Painless Experience.

The signs of impending death, says the *Medical Journal*, are many and variable. No two instances are precisely identical, yet several signs are common to many cases.

Shakespeare, who observed everything else, observed and recorded some of the premonitory signs of death also. In the account of the death of Falstaff, the sharpness of the nose, the coldness of the feet, gradually extending upward, the picking at the bedclothes, are accurately described.

For some time before death, indications of its approach become apparent. Speech grows thick and labored, the hands, if raised, fall instantly, the respiration is difficult, the heart loses its power to propel the blood to the extremities, which consequently become cold, a clammy moisture oozes through the pores of the skin, the voice grows weak and husky or piping, the eyes begin to lose their luster.

In death at old age there is a gradual dulling of all the bodily senses and of many of the mental faculties; memory fails, judgment wavers, imagination goes out like a candle. The muscles and tendons get stiff, the voice breaks, the cords of the tabernacle are loosening. Small noises irritate, sight becomes dim, nutrition goes on feebly, digestion is impaired, the secretions are insufficient, or vitiated, or cease, capillary circulation is clogged. Finally the central organ of the circulation comes to a stop, a full stop, and this stoppage means a dissolution. This is the death of old age which few attain to.

Many people have an idea that death is necessarily painful, even agonizing, but there is no reason whatever to suppose that death is a more painful process than birth. It is because, in a certain proportion of cases, dissolution is accompanied by a visible spasm and distortion of the countenance that the idea exists, but it is as nearly certain as anything can be that these distortions of the facial muscles are not only painless, but take place unconsciously. In many instances, too, a comatose or semi-comatose state supervenes, and it is altogether probable that more or less complete unconsciousness then prevails. We have, too, abundant evidence of people who have been nearly drowned and resuscitated, and they all agree in the statement that after a few moments of painful struggling, fear and anxiety pass away, and a state of tranquillity succeeds. They see the visions of green fields and in some cases hear pleasing music, and so far from being miserable, their sensations are delightful. But where attempts at resuscitation are successful, the resuscitated persons almost invariably protest against being brought back to life, and declare that resuscitation is accompanied by physical pain and acute mental misery.

Death is a fact which every man must personally experience, and consequently is of universal interest, and as facts are facts, the wiser course is to look them squarely in the face, for necessity is coal-black and death keeps no calendar.

PUSH THE SANITARY LITERATURE. — The *Sanitary Record* (London) says: "The future of sanitary progress depends to a great extent upon the good-will and co-operation of the people at large. The vast amount of injury caused by preventable disease is hardly likely to be materially affected until the people work hand-in-hand with the authorities for its removal. Otherwise, medical men may theorize and parliamenta legislate in vain." The opposition to State boards of health, city ordinances, and legal sanitation generally comes from those ignorant of the value of preventive medicine. This has been true of all reforms and advanced thought on any subject. The remedy is education, and how best to disseminate the knowledge accumulated regarding public medicine and the value of hygiene, is a problem that is yet to be given a practical solution. The people have not been taught the value of obeying hygienic laws and the practical worth of general sanitation in every-day life. They have beheld its service in quarantine, in the arrest or prevention of epidemics, but have not been taught the value of sanitation in the conditions that surround them in the ordinary experiences of life.

TREATMENT WHEN FOREIGN BODIES ARE SWALLOWED.—Considering the frequency with which foreign bodies are swallowed, especially by children, the best treatment to employ in such cases should be generally known. A variety of such methods has been advocated, but just now the so-called "potato cure" appears to be the most popular. One physician not long ago reported that he had successfully applied it with the best results in three cases. One was that of a 6-year-old boy, who had swallowed a small weight; another, that of a girl, 9 years old, who had swallowed a nail; and the remaining one, that of a woman who had swallowed a set of teeth. He fed the patients for three days on nothing but potatoes. This treatment is a method in vogue among the pickpockets in London, who, swallowing their booty, live on potatoes until the stolen articles have passed down and out of the body.

USEFUL INFORMATION.

HOW TO WEAR SHOES.—It is true economy, according to *Good Housekeeping*, for every person to have several pairs of shoes, and to wear them alternately. In the first place, by so doing, corns and other soreness of the members may be to a considerable degree avoided. These come from continuous friction or pressure at a certain point, and as no two pairs of shoes "wear" on the feet quite alike, the change breaks up the continuity and obviates or prevents the unpleasant result. It is also better for the shoes themselves. Do not wear them, in ordinary weather, if the best service is desired, more than three or four days, or a week at most, before giving them a chance to become thoroughly dry. Many if not most feet emit sufficient moisture to affect the shoe, giving it the sticky, unpleasant feeling which is so familiar, but to which we do not often give a second thought. Contrast this feeling with that of a shoe which has been standing unused for a week or a month, and notice how grateful the feeling of thorough dryness in the last named. Perhaps the reader never thought of that before.

GLASS AS A SUBSTITUTE FOR LITHOGRAPHIC STONE.—A new use, it is said, has been found for polished plate glass in Germany. Mr. Frederick Winterhoff, of Cologne, recently exhibited in that city a large number of glass impression plates, which will displace the use of stone impressions in lithography. The advantages claimed for plate glass are less bulkiness, as much less room is required to store the prepared plates; the readiness with which transfers can be made from them on to stone, zinc or glass; their freedom from veins and lime flecks, so often occurring in lithographic stones of large size; and the great factor of cost, the cost of glass being a vanishing quantity when compared to the cost of lithographic stone. Transfers from stone require from 30 to 60 minutes; from glass plates transfers have been made in ten minutes, and are said to have been as clear, sharp and fine-lined as is possible in the best lithographic work heretofore accomplished.

FOREIGN COMPETITION ON OUR OWN SOIL.—There seems to be an inclination expressed by British manufacturers to remove their plants, or invest their capital in new ones, in this country, to offset the restrictions placed upon their American commerce by the new tariff law. As it is evident that the passage of this important Act will have a tendency to increase domestic manufactures, it is not remarkable that foreign capitalists are desirous of making heavy investments here. But alien capital and labor ought to be placed under such restrictions that the interests of American citizens engaged in production shall be protected against undue business rivalry on our own soil.

AN ARIZONA NATURAL BRIDGE.—There is said to be in the northern part of Gila county, Arizona, a natural bridge which spans Pine creek by a single arch of 200 feet, with walls on either side rising to a hight of 700 to 800 feet. The bridge is 600 feet wide and the thickness of the arch is 40 feet, rise not stated. The account says that the rock is limestone, worn very smooth by the action of water. One part near the corner of the arch is only 6 feet thick and is pierced by an opening.

A NEW IDEA IN WALL-PAPER.—*Modern Light and Heat* says that an enterprising wall-paper manufacturer, with original ideas, has made use of the beautiful silhouettes of foliage, etc., projected by the electric light, for designs in his business. It would be difficult even for the most artistic imagination to conceive a more exquisite design than we see nightly painted on the walls and greensward of our streets and parks.

PLANT FOOD.—A French agricultural experiment station reports that out of 575 plants the goat eats 449 and refuses 126; the sheep out of 518 plants eats 387 and refuses 141; the cow out of 494 plants eats 276 and refuses 218; the horse out of 474 plants eats 262 and refuses 212; while the pig out of 243 plants eats 72 and refuses 171.

THE POTATO BUG.—An amateur scientist student at Wakefield, Mass., planted a potato in a little soil at the top of a factory, 40 feet from the ground, to see if the potato beetle would find the plant. It has found it, and now the amateur wants to know whether the beetle is a bird or a fly.

HEADS.—The usual size head for an adult Englishman is No. 7. Germans have round heads, Malays small ones. The heads of Portuguese average from 6⅞ to 7 inches; those of Spaniards are a little larger. The heads of Japanese exceed the English average.

GLASS-LINED TUBING, which has the great advantage of preventing lead or metallic poisons of any kind, and of conveying water and other liquids in a state of perfect purity, is coming into use in Great Britain.

HORSEFLESH AS FOOD.—It is said some 14,000 horses are annually consumed as food in the city of Paris. About one-half that number are consumed in Berlin and in Vienna each.

THE BONZANO METALLIC RAILROAD TIE CO. has been chartered in New Jersey, with a capital of $1,000,000, to manufacture steel railroad-ties, under the patents of M. F. Bonzano, assistant general superintendent of the Philadelphia & Reading R. R. Prominent railroad officials and business men are identified with the enterprise.

PAINT-SPOTS may be removed from wood by covering them with a thick coating of lime and soda. Wash off after 24 hours.

THE ordinary sand filter will not destroy or filter out bacteria from water.

ELECTRICITY.

The Electric Motor vs. Steam Engine.

A contemporary claims that the electric motor is probably the most simple and compact piece of machinery ever made for producing power. As much as 25-horse power of apparatus can be set up in a space less than five feet square, and where minimum of space is a desideratum this is an important point. There is only one moving part in the machine—*i. e.*, the armature, and only one set of bearings. The wear is entirely confined to the one set of babbitt shells, the commutator and the brushes, all of which form but a small part of the total cost of the machine, and all of which can be renewed when worn out at a comparatively small cost. When this minimum of moving parts is compared with the number of levers, valves, rods, etc., required by a steam engine, and the necessary accompanying wear and tear, the reason for the low repair account of the electric motor is manifest.

The space taken up by the motor is considerably less than that by the engine. In addition to this the attendance required by an electric motor is very much less than that required by a steam engine, being in general confined to a few minutes' attention each day, while the steam engine requires, while in operation, the constant attention of a skilled engineer. The following comparison of a few points of a steam engine and a Spragne electric motor, each of 10-horse power capacity, is interesting, as showing the greater simplicity and economy of the electric machine:

	Motor.	Steam Engine.
Number of moving parts	1	9
Number of wearing parts	5	20
Floor space (square inches)	8½	36
Room occupied (cubic feet)	16	316
Percentage of mechanical friction	1	80
Actual H. P. percentage of indicated horse-power	100	80
Quarts of oil used per week	¼	12

CULTIVATION OF PLANTS UNDER THE ELECTRIC LIGHT.—The experiments in the cultivation of plants under the electric light, recently made by the botanical department of Cornell University, have given some curious and interesting results, and results which are in some respects confirmatory of somewhat similar experiments not long ago reported from Russia. The first and most noticeable effect of the treatment is an enormously increased rate of growth. The plants which are lighted seem to work day and night and to "run very much to leaf." Vegetables shoot up very quickly, and peas in a few weeks are two or three times as tall as those planted at the same time in daylight. In the case of seeds and fruit of any kind, however, the results are entirely different, and the plants which had grown slowly and by daylight were ahead. It was observed that, in every instance, the reproductive powers of the plant were strongly affected, being sacrificed to mere foliage and rapidity of increase in general size.

SMALL MOTORS MOST SUCCESSFUL.—The economy of small electric motors for industrial purposes is shown in a shoe factory in Brockton, Mass., where for the last year and a half a 25-horse power motor has been running the machinery. This is being replaced with three motors of 15, 10 and 5 horse-power respectively, and a saving of 6-horse power is looked for from the change. The electric-power company that furnishes the current agrees to charge less for the current for the three small motors than it did for the one large one.

AN ELECTRIC MOTOR CAR is being constructed at Springfield which, it is claimed, will be noiseless. It will be about ten feet long and will draw two cars. It will be furnished with 300 cells and two 20-horse power motors, which will give 100-horse power, sufficient for an entire day's work. The mechanism is so arranged that the car can be propelled by either the overhead system or storage batteries. The company making it claims that it will do away entirely with overhead and underground wires.

AN ELECTRIC TRICYCLE has been built at Englewood, Illinois, which it is said can be driven 20 miles an hour on an ordinary road. Its construction is similar to that of the ordinary tricycle, except the size, which is much greater. Beneath the seat is an electric storage battery and dynamo which furnish the motive-power. The battery, it is claimed, can be charged at a cost of 50 cents, and one charge will run the vehicle over 120 miles. The total cost of this novel road machine was $900.

STORAGE BATTERY TRACTION is being rapidly pushed in New Orleans. Thirty cars in all are to be installed within the next few months. Thirty trucks are already mounted with motors and prepared to receive the car bodies

TABLE OF CONTENTS.

EDITORIALS.—The Davis-Colby Ore-Roaster; Mines and Mining at the Fair, 297. Passing Events; The Opportunity of Two Mining Magnates; Surveying the Field; Questions Answered; Information for the Mining Public, 304. A Scarcity of Miners; How Millionaires are Made; Grass Valley and Vicinity, 305.
ILLUSTRATIONS.—The Davis-Colby Ore-Roaster. 297. Colonel George R. Davis, Director-General of the World's Fair, 299. Map of Grass Valley Mining District, 305.
CORRESPONDENCE—Auriferous Cement Deposits of South Dakota; Notes from New Mexico, 298.
MISCELLANEOUS.—A Big Business; Electricity on the New York Elevated Roads; Coal in the Black Hills; The Cause of It; Freezing Quicksands; A Book for All Who Travel by Rail, 298. San Bernardino County; The Director of the World's Fair; British Shipbuilding; Making Iron Without Puddling, 299.
MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 300-301.
MECHANICAL PROGRESS.—Mechanical Evolution; Tempering in Oil Known to the Ancients; Terne Plates and Their Origin; Case Hardening Iron by Electricity; To Detect Flaws in Metal; Miscellaneous, 302.
SCIENTIFIC PROGRESS.—A Liquid, Volatile Nickel Compound; Scientific and Practical Knowledge; Singular Electrical Effect; The Watch as a Compass; Electricity in Insects; A Reason for Everything; The Voice of the Dead; Great Endurance of the Maxim Gun; Miscellaneous, 302.
ENGINEERING NOTES.—Tubular Steamships for Ocean Service; A New Era in Boat-Building; The Fastest Steamer 303.
GOOD HEALTH.—Dying Usually a Painless Experience; Push the Sanitary Literature; Treatment When Foreign Bodies Are Swallowed, 303.
USEFUL INFORMATION.—How to Wear Shoes; Glass as a Substitute for Lithographic Stone; Foreign Competition on Our Own Soil; An Arizona Natural Bridge; A New Idea in Wall Paper; Plant Food; The Potato Bug; Heads; Glass-Lined Tubing; Horseflesh as Food; Miscellaneous, 303.
ELECTRICITY.—The Electric Motor vs. Steam Engine; Cultivation of Plants Under the Electric Light; Small Motors Most Successful; An Electric Motor Car; An Electric Tricycle; Storage Battery Traction, 303.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 308.
MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 308.

Passing Events.

Among the most notable passing events of the week was the election, general throughout the whole country, and in which both parties, as usual, came out ahead—that is, in different localities.

A fire occurring on Monday morning, nearly consumed the Grand and the Burlington hotels, causing a loss of over half a million. It is generally thought that this fire should not, under the circumstances, have proved so destructive.

A great strike is reported in the Sheridan silver mine, San Miguel county, Colorado. Manager Waters says 3000 miners could not take out the quantity of ore developed in 15 years.

Several of our cheap mineral products, such as plumbago, manganese, etc., are beginning to be shipped East after an interval ranging from 15 to 20 years; 500,100 pounds of pinmbago were sent to London last week, with the prospect that other and probably larger shipments of this mineral will soon follow. Shipments of copper ore and chrome promise also to increase hereafter.

Stanley, the African explorer, arrived at New York on the 5th inst. It is his purpose to lecture on this side, but the chances are that the unseemly squabble in which he has become involved with certain of his aids will materially dim the luster of his exploits on the "Dark Continent."

The city of Chicago has just voted to appropriate ten and a half million dollars in aid of the World's Fair, a sum that, judiciously expended, ought to insure the success of the great show.

The weather in California continues dry and pleasant, though the heavy blow on Wednesday night last is by the weather sharps considered to presage a change, being regarded as the forerunner of rain. Severe storms have greatly interfered with business in regions east of the Rocky mountains; farther west, however, we hear no complaints of this kind.

Surveying the Field.

From all parts of the mid-continent mining regions, as also from those of the extreme West, the intelligence that comes to hand is of a cheerful and in most instances of a highly encouraging kind. Consulting these sources of information, we infer that the output of bullion for the current year will be the largest ever made. That the year's product of lead and copper will exceed all precedent admits of no question, nor is there any doubt but the same would have been true of silver had favorable legislation on that metal been taken a few months earlier.

Of the many localities where notable progress seems to have been made in the mining industry, only a few can here be mentioned or even so much as hinted at.

The discovery of silver deposits, rivaling those of Leadville, are reported in Colorado. The mineral resources of the new State of Wyoming are for the first time beginning to attract considerable attention, while Montana, her neighbor on the north, seems this year likely to surpass all her former efforts, or, as the horsemen say, "break the record." California will be able to make a favorable report, Idaho, Utah and Nevada coming in a good second. In Washington and Oregon the work performed has been largely preparatory, both of these States having a grand future before them. Besides her vein mines, Southern Oregon contains many very valuable hydraulic properties, some of which offer the best possible field for investments, the conditions for the prosecution of this branch of mining being there exceptionally good.

Arizona, recovering from the lethargy incident to the low prices of copper and silver, responds to the improved market for those metals promptly and in a manner alike gratifying to the friends of the new silver law and creditable to the energy of her mining population. The old Tombstone district of glorious memory is taking on new life, the opinion of those best qualified to judge being that history will here, before very long, repeat itself, the thousands now turned out running again up into the millions. We trust this will prove to be the case, because mining, besides being prosecuted with success, has ever been conducted in a clean way down in Tombstone.

In the Silver King mine, also of good fame, a rich strike is reported, this announcement being the more pleasing in that the company, after years of unwonted prosperity, had long been in horrasco—so long that they had begun to despair of the property ever being restored to a dividend-paying basis, a condition now likely soon to be reached. When affairs were at this low ebb and the shareholders were beginning to gather in at the death, the company wisely secured the services of Mr. Oscar Grove as manager in the field. This gentleman, formerly superintendent of the Rainbow, one of California's most successful gold mines, aided by his good judgment and extended experience in vein mining, was not long in discovering the proper direction in which to drive in his explorations after ore, results having confirmed the soundness of his ideas in that connection. That the Silver King of Pinal county, Arizona, will soon come to the front once more may now be expected.

MOUNT WHITNEY, in California, still remains the highest mountain in the United States, Mount St. Elias, once supposed to be 19 000 feet, having by late measurements been determined to have an elevation of no more than 13,500 feet.

Information for the Mining Public.

Not a week passes but we receive numerous letters asking information in regard to the various mining methods, processes and machinery now most employed or of most approved use. As a means of answering these and similar inquiries, we give here a list of the articles published in the Reports of the State Mineralogist on the several topics most apt to be the subjects of these inquiries. While these articles may not in every case contain as full information as might be desired, they are for the most part tolerably complete. They are always authoritative, having been prepared by the State Mineralogist himself or by specialists employed for the purpose.

Commencing with the fourth volume of these reports, there being also several valuable papers in those that precede it, we find this book wholly devoted to a description of the various metals and minerals heretofore found in California with a statement of the place of their occurrence, etc., this, as containing a very full and at the same time the first list of the kind ever compiled, being a work of much interest as well as of great practical value. The next volume in this series of reports is given up to a description of our borax deposits, the methods employed in the manufacture of this salt, a history of the business, etc.

In 1886 two reports were issued by the Mining Bureau, the one covering the first half of the year, having been prepared by Henry G. Hanks, State Mineralogist, and the other, covering the balance of the year, by his successor, Wm. Irelan, Jr. The first of these is largely occupied with an account of the mineral and thermal springs found in California, besides which it contains a variety of other matter pertaining to the subject of mining in general. The other volume of 1886 contains two very important papers, the one on chlorination, prepared by the State Mineralogist, and the other on concentration, prepared by J. M. Adams, E. M., the latter being profusely illustrated. Appended to this book is a complete code of the U. S. mining laws, with much other information of general interest.

The report for 1887 contains, besides two exhaustive articles, the one on the petroleum deposit of California, and the other on the coal mines of the Western coast, several papers on natural gas, asphaltum, building-stone, etc.

Volume 8th of the series, which covers the year 1888, is devoted mainly to a description, by counties, of the gold and silver mines of California, the subject being treated in a most thorough, systematic and intelligent manner and with all desirable fullness, nothing of the kind so complete having ever before been gotten up and given to the public. This book also contains able and invaluable papers on the Milling of Gold Ores in California, Drift Mining, the Smelting of Lead Ores, Metallurgical Processes, Natural Cement, Building Stones, and a variety of other matters of great practical value to the miner, this being one of the most useful volumes in the entire series.

In 1889, the State Controller having withheld the funds appropriated for the use of the Mining Bureau until the working season was half-gone, the report of the State Mineralogist for that year was necessarily much restricted in volume. It contains nevertheless a large amount of useful information, on all subjects vital to the interests of the miner. In this book we have extended papers on the occurrence and working of the auriferous gravels in California; on the refining of the precious metals; river-bed mining; the useful clays; slate quarries; coal products; cement; glass sand; meteorology, etc.

Parties desirous of obtaining information on any of the subjects above mentioned would do well to consult these reports of our State Mineralogist, who will forward either of the two volumes last published, on receipt of postage, being at the rate of 23 cents on the report of 1888, and 14 cents on that of 1889. The other volumes cannot be obtained from the Mining Bureau, but only as they can be picked up outside. We would undertake to procure and forward any volume of the series on application; that is, in so far as they can be had.

A DUTY of 1½ cents per pound is to be levied on the entire weight of ores from Mexico of which lead is the chief component part, instead of on the actual weight of lead in ores, as has been the practice heretofore.

An Irrigation Inquiry.

We have received copies of a circular issued by R. J. Hinton, as special agent of the U. S. Department of Agriculture for the collection of information on irrigation. This branch of Government work, which promises to be of much value and importance, is provided for by the following clauses in the Deficiency law approved by the President Sept. 30, 1890:

Irrigation Investigations—To enable the Secretary of Agriculture to continue to complete his investigations for the purpose of determining the extent and availability for irrigation of the underflow and artesian waters within the region between the 97th degree of longitude and the eastern foothills of the Rocky mountains, and to collect and publish information as to the best methods of cultivating the soil by irrigation, $40,000. *Provided*, That no part of said sum shall be expended under this paragraph unless the entire investigation, collection and publication contemplated herein, including the report thereon, can be fully and finally completed and finished before July 1, 1891, without any additional expense, cost or charge being incurred.

To aid him in securing data for this report, Col. Hinton has prepared blank forms of questions with spaces for answers by those who will contribute the information desired. These questions cover the engineering features of the irrigation enterprises in all neighborhoods, the canals and ditches, reservoirs, dams and weirs, acreage irrigated and character of crops grown; the value of irrigated lands as compared with adjacent arid lands, etc. It is also designed to pay especial attention to irrigation by artesian wells, as well as to all appliances for raising and distributing water.

Col. Hinton has a wide acquaintance with such subjects, as his previous reports to the Government show. We hope our readers will volunteer their aid and apply for blanks for reports, if they do not receive them. All correspondence addressed "Artesian Wells Investigation," Dept. of Agr., Washington, D. C., will reach the spot. It will be a good thing for California to have her irrigation enterprises and their results publicly proclaimed.

A Highly Useful Invention.

Geo. R. Evans has invented a system of tubes for ventilating and disinfecting the holds of vessels, letters patent for which have been applied for through the SCIENTIFIC PRESS Patent Agency, Dewey & Co., Solicitors. By this contrivance, iron tubes, pierced with numerous holes, are extended from the deck of the vessel into the hold, the same being so arranged as to establish and maintain an upward and a downward draught, causing a thorough ventilation of the hold and its contents. This apparatus can also be employed for fumigating vessels, a purpose for which it seems exceedingly well adapted.

The top of the tube, set flush with the deck, is closed, when desirable, with a cap that screws into it, this cap being so beveled as not to interfere with the passage of anything over it. To the top of the tube when open a windsail may be attached, as a means of gathering in an additional supply of air, thus rendering ventilation more effectual. For fumigating the vessel's hold, killing vermin or extinguishing fire, the fluid or compound employed for such purpose is simply poured into the open tube and the cap screwed on, the material being left to do its work. It is expected that the owners of vessels supplied with this apparatus will be able to effect insurance at much reduced rates.

Associated with the inventor of this tube system of ship ventilation is Mr. Philip Giovannini, the mechanical engineer.

As soon as the patent issues for this device a cut illustrating it will appear in the MINING AND SCIENTIFIC PRESS.

Questions Answered.

I. M. Miller desires to be informed through the PRESS how many gallons are contained in an oval-shaped reservoir, 45 feet wide, 48 feet long and 9 feet deep; also, how many gallons of water will pass per hour through a one-quarter and a one-half inch nozzle, 70 feet head, no allowance for friction.

Answer to first inquiry—116,164 gallons. The answer to the second inquiry cannot readily be given, as the rules on which calculations of this kind are based make always a certain allowance for friction, nor is it clear from the writer's wording whether one nozzle or two is meant.

A Scarcity of Miners.

There appears to be at the present time throughout all our mineral regions a scarcity of miners; even in the coal and iron districts of the East, where there is usually a surplus, we hear complaints of this kind. It is not long since work at many places in these districts was restricted to half time as a means of affording those seeking employment a chance to earn something.

In accounting for such changed condition of the labor market, several factors have to be consulted. The extensive strikes, prolonged to weeks and even months in some localities, have caused many miners to abandon that and take to other callings. Among our native-born population, the young men do not generally take to mining; some less laborious employment, with the chances of bigger pay, suiting them better. All classes are being more and more drawn to the cities and the large manufacturing districts, these greatly enlarging the field of labor. Even the sons of miners are less inclined now than formerly to follow the calling of their fathers, this being true even in the mining sections of England, Wales and Scotland, and probably also in those of Continental Europe.

At the same time new mines are everywhere being opened, more especially in the silver-lead and copper-producing regions, the high prices ruling for these metals having greatly stimulated these several branches of mining. The consumption of coal is steadily on the increase, creating a demand for more operatives in this department of the business, the same being measurably true of lead and copper. From California we are, after a long interval, beginning to ship small lots of the useful minerals, such as graphite and manganese, shipments of chrome and copper being meanwhile somewhat increased.

While then the demand for miners is being augmented, the supply is being diminished, giving just grounds to fear that there impends a troublesome stringency in this branch of the labor market, suggesting that effective measures be adopted, if this be possible, to avert the threatened danger.

As far as California is concerned, it would be well were more of our young men and boys to turn their attention to mining. For young men adapted to the business, the chances for making money are better in this direction than in any other. The time spent in learning a trade, if spent in the mines, would often suffice to give them a good start in life, and in many instances might result in laying the foundation for a fortune, the chances of achieving success in the mines, everything considered, being nearly as good now as they ever were. In so far as a certain class of imported labor is concerned, that need not deter our youth from engaging in this pursuit. The Hungarians and Poles, no more than the Chinese, have proved in this country a satisfactory kind of miners.

How Millionaires Are Made.

An Eastern publicist, in an endeavor to enlighten us as to the manner in which most modern millionaires are made, calculates that it has taken the savings of about 1000 wage-earners to create one of these low-grade plutocrats; that is, the small accumulations of a thousand excessively poor people are required to make one excessively rich person. While the above estimate may be correct, or nearly so, as regards Eastern communities, it would not apply on this coast. Here it has not taken the aggregated hoard of more than half the above number to elevate even the most impecunious to the rank of a Croesus, and that for the reason that the earnings of the masses have with us been much larger than in most other countries. The bloating process has, however, been conducted here much the same as elsewhere, the Stock Board having been the most potent factor employed for transferring the little store of the many to the treasure-vaults of the few.

Of the confiding poorer classes, none have escaped—all have been victimized. Everything in sight has been raked in by this essentially thievish method—the small bank deposit and the widow's mite; the laboring man's earnings and the children's dimes; the savings of the sewing woman and the servant girl; the outside lot and the family homestead; all the small sums amassed through overwork and comforts denied, all have gone to over-enrich these plotters against justice and humanity.

But in all this, the methods for robbing the masses to which recourse has been had have not here differed much from those elsewhere employed, the results reached having been much the same. Everywhere it has been the same system of plundering the trusting poor—the many hurtfully impoverished, that the few might be made hurtfully rich. This evil, through the bitter experience of its victims, has come to be much abated. Thankful for this, let us hope that it will soon become wholly a thing of the past.

THE iron molders have notice from headquarters that the strikes at the East are off and the Unions must everywhere act accordingly.

THE employment of nickel for plate armor is likely to much enhance the value of that metal.

Grass Valley and Vicinity.

We present herewith a cut of the town of Grass Valley and its environs. This is in a mining point of view one of the most interesting towns in the State, both because of its historical associations and its present condition. Here it was that quartz-mining in California had its origin, and here to-day we find the most active and prosperous quartz-mining center in the State. Gold Hill, shown in the cut, is the site of the first quartz extracted and milled in this locality. Here as early as the spring of 1851, large quantities of quartz were taken out and piled up awaiting facilities for crushing it. Gradually the business spread to the neighboring hills, shown in the cut, these being low eminences of easy approach, and all the sites of rich quartz veins. Nearly all these veins have in times past been opened, equipped with plant, and extensively worked, the majority of them having paid well, some of them having yielded millions of profit. Not a few of these mines are still being largely and successfully operated, the Idaho having in this respect the best record of any mine in the State.

MAP OF THE GRASS VALLEY MINING DISTRICT, NEVADA COUNTY, CALIFORNIA, SHOWING THE LOCATION OF THE PRINCIPAL MINES.

Grass Valley, the largest and most prosperous town in Nevada county, contains about 4000 inhabitants. It is a well built and beautiful place, being noted for the great number of its fine residences, its orchards, vineyards and flower gardens; and what is still more to its credit, for the high morality and the intelligence of its inhabitants.

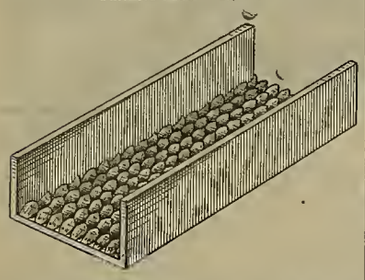
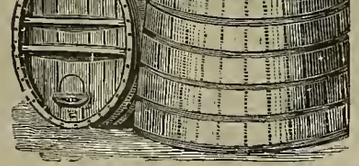
TRAFTON'S
Gold Saving Device.
Patented June 17, 1890.



A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars. CHAS. TRAFTON, Yankee Jim's, Cal.

RIX & FIRTH,
225 and 227 First St., San Francisco, Cal.
Compressed Air and Water Power Machinery.

KNIGHT'S WATER WHEEL,
For Mills, Pumping and Hoisting.
OVER 300 IN USE.
All estimates guaranteed. Send for Circular.



WATER TANKS! WINE TANKS!
CALIFORNIA WINE COOPERAGE CO.
FULDA BROS., Proprietors,
30 to 40 Spear St., San Francisco.
ALL KINDS OF CASKS, TANKS, Etc.
☞ SHIP, MINING, and WATER TANKS a Specialty. ☜

CLAYTON AIR COMPRESSORS
For Working
Rock Drills, Coal Cutters, Hoisting Engines and Water Pumps in Mines and Tunnels, Sinking Caissons, Etc., Etc.
SEND FOR CATALOGUE No. 6,
Clayton Air Compressor Works,
43 DEY ST., NEW YORK.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
— ALSO —
HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, Iron ¼ to 3 inch diameter and Flats from 1 to 8 Inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

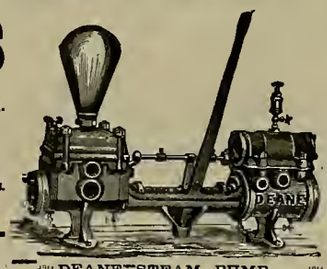
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers. DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

Lands, Mining and Commission,
124 SANSOME STREET,
Rooms 21 and 22,
Telephone No. 5057. SAN FRANCISCO.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manilla Rope, Duplex Rope, Tarred Manilla Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 6, 1890.

Trade the past week was fairly active considering the exciting election held on last Tuesday. Now that the result is known, trade will resume its normal condition within two or three days. The local money market is fairly easy, with no marked call for speculative purposes or from any particular branch of business.

The steamer City of Peking for China took out the following treasure: To Hong Kong, Mexican dollars, $85,580; gold coin, $29,555; gold dust, $300. To Yokobama, Mexican dollars, $20,000.

MEXICAN DOLLARS—Trade continues dull, with prices ranging from 83½c to 84½c.

SILVER—Press telegrams report the following purchases by the Department at Washington: Nov. 3, the amount offered was 1,060,000 ounces. The amount purchased was 515,000 ounces, as follows: 40,000 ounces at $1.0640, 50,000 ounces at $1.0655, 250,000 ounces at $1.0665, 175,000 ounces at $1.0670. Nov. 5, the amount of silver offered for sale to the Treasury was 1,055,000 ounces. The amount purchased was 370,000 ounces, as follows: 300,000 ounces at $1.0624, 70,000 ounces at $1.0639. As will be seen by the above, the selling offers are still large, which causes many not to look for any reaction for the better in this month. A Washington telegram of Nov. 3 says that the issue of standard silver dollars from the Mints during the week ended Nov. 1 was $848,313. The issue for the corresponding period last year was $815,593. The shipments of fractional silver coin during October amounted to $1,539,589. Bi-metallists are confident that the result of the Congressional elections means free coinage of silver for this country, as that and lower tariff were the chief issues at the East.

BORAX—Receipts the past week aggregate 857 ctls, and exports by sea, 250,316 lbs to New York, 2000 lbs to Central America and 326 lbs to China. The market is strong at full figures.

LIME—Receipts the past week aggregate 4865 bbls, and exports by sea, 700 bbls to Honolulu. The demand is reported to be steady, and confined to immediate requirements owing to the lateness of the season.

QUICKSILVER—Receipts the past week aggregate 382 flasks. The market is barely steady. The demand continues fair for the season.

LEAD—The market is barely steady. Eastern advices indicate a gradual sinking in prices; 749 bars were exported the past week to New York.

IRON—Imports of pig the past week aggregate as follows: Newcastle (England), 170 tons; Oregon, 340. The market is without essential change. Eastern and European advices are conflicting, but the general tenor points to better prices.

TIN—The market for spot is dull for both pig and plate. For plate the tone is strong, but for pig it is unsettled, owing to buyers considering that importers ask too much. At the East and abroad the markets are easy.

COPPER—Exports by sea the past week aggregate as follows: Bars, 13; cement, lbs, 8300; matte, lbs, 536,315; and 34,500 lbs ore. The market is strong at full figures. At the East the market is reported firm under a continued good demand. London cables to the *Iron Age*, Oct. 29, report as follows: Copper has been rather slow and the appearances are that consumers' immediate wants are well supplied by recent heavy deliveries. Holders, however, are not disposed to increase engagements. Outsiders are holding off.

COKE—Imports the past week aggregate as follows: Hull, 150 tons; Newcastle (England), 423. The spot market is strong.

COAL—Imports the past week aggregate as follows: Comox, 4200 tons; Newcastle, N. S. W., 3332; Tacoma, 6850; Coos Bay, 600; overland, 20; Seattle, 7569; Nanaimo, 3736; Vancouver, 1009; Port Townsend, 1100; Departure Bay, 1700; Hull, 1010; total, 31,117 tons. The market in all positions is very strong, with large dealers looking for still higher prices for spot as soon as the weather sets in colder. The yards are bare. Advices from Australia and from the Wellington collieries are of the same tenor reported last week.

San Francisco Metal Market.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Removal of the Novelty Plating Works.

The proprietors of the San Francisco Novelty Plating Works have lately removed their establishment from 108 and 112 First street to Nos. 68, 70 and 72, same street. The steady growth and present magnitude of the business done by this company is denoted by the fact that they have since starting, more than 20 years ago, been compelled to make several removals, seeking each time more capacious and commodious quarters, the building they now occupy being one of the largest of its class in the city.

It will be seen by consulting the card of this firm, published in another column, that they make the silvering of copper plates for saving gold a specialty, this being a branch of silver-plating in which they have had large experience. They have filled thousands of orders and can furnish any number of satisfactory references if required.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of October, 1890, an assessment (No. 20) of Six Cents (6c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of December, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office—Room 11, No. 303 California Street, San Francisco, California.

A LIBRARY FOR $1.00

Five books in one. Worth its weight in gold to every mechanic. The very latest information for 20 different trades. This wonderful book contains 575 pages absolutely teeming with rules, tables, secret processes, and new information that cannot be had elsewhere for less than $25.00. The Modern Steam Engine—How to Run an Indicator—The Westinghouse Air Brake—Blacksmith and Machinist's Tools—Practical Mathematics Simplified—Tin and Sheet Iron Worker's Manual—Carpenter's Manual—Points for Painters—Magnetism and Electricity—How to Get a Patent—A Mechanical Dictionary. Everything fully explained in one handsome volume and guaranteed to be absolutely correct. Send $1.00 for a copy bound in silk cloth, or $1.50 for Morocco binding. With each copy of the book we give free a complete working chart for setting gear teeth. The regular price of this chart is $1.50. AGENTS WANTED. Write for terms. LAIRD & LEE, Publishers, 203 Jackson Street, Chicago, Ill.

ANNUAL MEETING.—THE REGULAR annual meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the company, room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 17th day of November, 1890, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 14th, at 3 o'clock P. M.

ALFRED K. DURROW, Secretary.

Of Interest to Miners.

Among the many enterprises that have had their origin in our city none have met with greater or more deserved success than has the Fidelity Mutual Aid Association of No 315 California street. Starting only a few years since, it has, by its prompt attention to the claims of its members, created with the insuring public a feeling that a certificate of membership in the "Fidelity" was the best indemnity that could be secured. Granting, as it does, an accidental indemnity equal to that given by any accident company, it also furnishes sick benefits of $8.00 per week, and places this within the reach of all—whether business or working men. Feeling that it is of interest to miners and mining men to know where accident insurance can be secured at the lowest price consistent with safety, we would call their attention to this Association, as it always pays all indemnities promptly and in full, as the following letters from mine superintendents will show:

JACKSON, CAL., Oct. 18th, 1890.

J. L. M. SHETTERLEY, Esq., Sec. and Gen. Manager Fidelity Mutual Aid Association, San Francisco, Cal.—Dear Sir: Your favor of the 8th inst., containing check for $23 in favor of Frank Delporto, duly received. You are making many friends for your Company among the employes of the Kennedy Mine, and it affords me great pleasure to add my testimony to the promptness and apparent cheerfulness with which you respond to the claims for benefits from the men in our employ holding policies in the Fidelity. Yours respectfully,

J. F. PARKS,
Superintendent Kennedy Mins.

IOWA HILL, CAL., July 16, 1890.

FIDELITY MUTUAL AID ASSOCIATION—Your favor of July 14th, containing checks for benefits due J. C. McCarnahan, Jr., and C. C. Campbell received, and I take great pleasure in informing you that the promptness with which you paid the said claims has undoubtedly established the name of your Association among the people as being a safe and reliable Association. I think if you were to have an agent at this place, for here and the surrounding district, that he could succeed in increasing your membership to a great extent, and I would recommend that you appoint W. R. Morton, Secretary of the Washington Mining Co., as such, as I know him to be a reliable and efficient man for the purpose. Hoping that you will meet with increased prosperity, I remain respectfully yours,

S. M. SPRAGUE,
Supt. Washington Company.

AUBURN, CAL., July 28, 1890.

FIDELITY MUTUAL AID ASSOCIATION, 315 California street, San Francisco, J. L. M. Shetterley, Manager—Dear Sir: Your note containing check on American Loan and Trust Co., drawn in favor of James Ward, was received yesterday. The same has been delivered to him and he will receipt to you. Respectfully, etc.,

J. B. PATTERSON,
Superintendent Eclipse Mine.

HATHAWAY MINE, NEWCASTLE, CAL., June 7th, 1890.

J. L. M. SHETTERLEY, Genl Manager Fidelity Mutual Aid Association—Dear Sir: I am in receipt of your check, favor of F. Johnson, for $16 00 for two weeks disability owing to an accident which occurred to him in this mine. This is the third instance in which our boys have to thank themselves for the benefits derived from your Association. With best wishes for the "FIDELITY," I remain, Yours truly,

G. T. TAYLOR, Supt.

THE RUSSELL PROCESS CO.,
Park City, Utah.

"A RIGID EARTH," being devoted to Ceology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses him elf to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to d sprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

RUPTURE AND PILES.

We POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. Terms: **No Cure, no Pay; and no Pay until Cured.** If afflicted, come and see us or send stamp for pamphlet. Address:

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.
Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4 000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

SITUATION WANTED.
YOUNG MAN WHO IS A COMPETENT MINERALOgist, Assayer and Analytical Chemist desires position; best references; can furnish a small capital. Address CHEMIST, Box 2617, San Francisco.

A. P. GRANGER, Denver, Colo.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly (through oversight or other mishaps) do us the favor to write again.

The Pittsburgh Boiler Scale Resolvent.

☞ This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad. Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

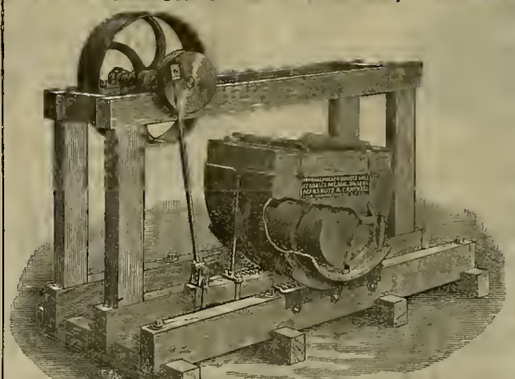
NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞ Send for Circulars and Price List. MARSHUTZ & CANTRELL.

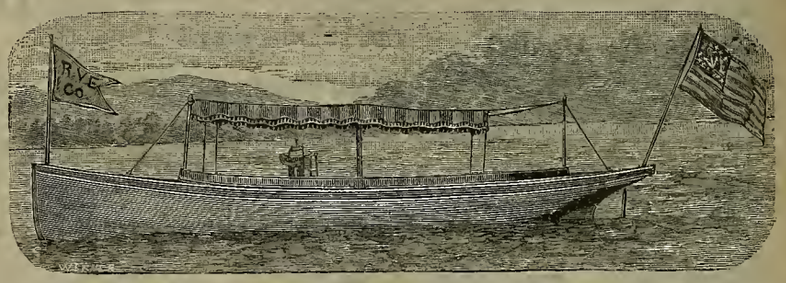
GEORGE HAAS, 824 Market St., Phelan Building, } SAN FRANCISCO, Feb. 21, 1890. }

REGAN VAPOR ENGINE CO.—Gentlemen: The 2 H. P. Engine you put up in our factory last November, has given satisfaction beyond my expectations. It do's my work better than thau those two Electric Motors did, with scarcely any expense for gas. I paid the Motor Company $25 per month for power, while the Vapor Engine has cost me but $2 per month so far. But, be I understood, I have not used the Engine as much as in summer, but the cost of motor would have been all the same, making a saving of $69 in three months. I am satisfied the Engine will pay for itself in less than two years. I use it for freezing cream, run three fans, cocoanut grater, etc.

Yours truly, GEO. HAAS.



Regan Vapor Launches

The uses for small steamboats and launches are innumerable; they are convenient and serviceable for transportation, and are a source of pleasure for those who are fond of sailing. But many have been deterred from purchasing such boats, because of the trouble and inconvenience of using coal, and the necessity of obtaining a Government license, engineer, etc. Our motor does away with these objections. The small space taken up by our engine in the boat **gives more room**; the boat will seat **twice** as many persons as one the same size fitted up with a steam engine. It takes only **two minutes to get under headway**, and can be stopped when running at full speed within the length of the boat, the reverse motion being instantaneous and effective. We carry in stock six regular sizes of hulls, from 18 to 33 feet in length, our models being the best that can be obtained, and built in the strongest and most substantial manner by Thos. Kane & Co., Racine, Wis.

REGAN VAPOR ENGINE CO., 221-223 First St., San Francisco, Cal.

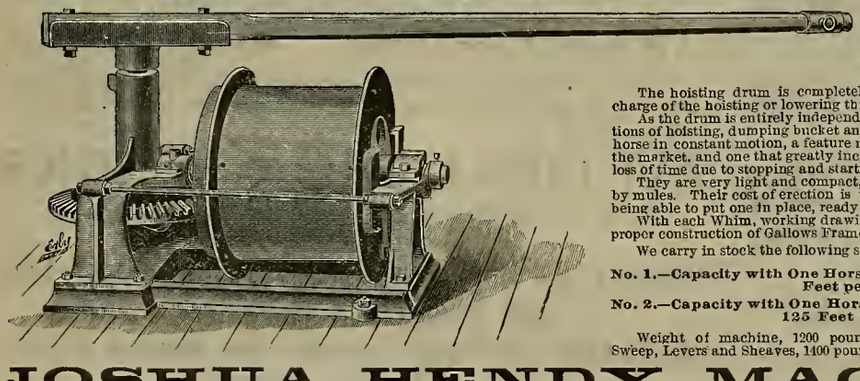
ELECTRIC VAPOR ENGINE CO.,
218 California St., San Francisco.

Complete Plants of all kinds, Stationary or Mounted on Wheels.
U. S. AND FOREIGN PATENTS.

"Sensible" Horse Power Hoisting Whims.



These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight, two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

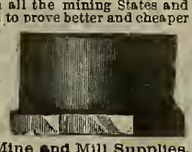
SAN FRANCISCO, CAL.

ADAMANTINE SHOES & DIES FOR STAMP MILLS.

These SHOES and DIES are in extensive use in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.



—MANUFACTURED BY—

CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent,
220 Fremont Street, San Francisco, Cal.

Special attention given to the purchase of Mine and Mill Supplies.

PAT. OCT. 25, 1881.

PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.

CLOT & MEESE,

Sole Licensed Manufacturers of the

MEDART PATENT WROUGHT RIM PULLEY

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

SHAFTING, HANGERS AND APPURTENANCES.

Does It Pay in the End?

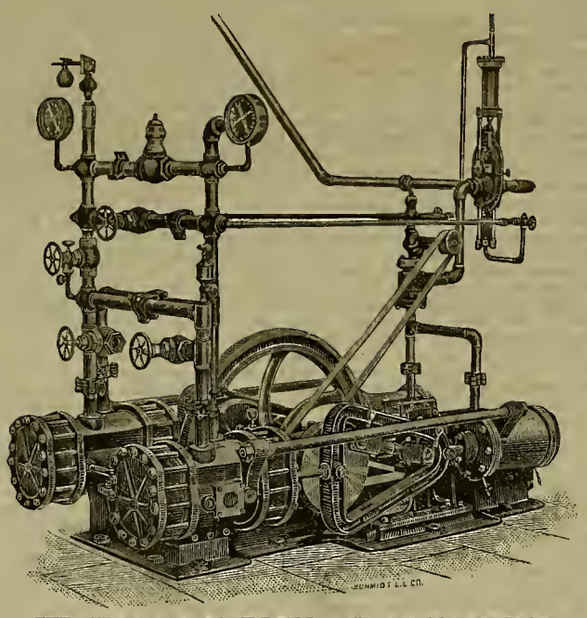
It has ever been a question with casuists whether or not wealth wrongly acquired is worth what it costs. Some people think it is. Very many in fact hold that opinion and, acting accordingly, hurry off and without much regard to the means employed, "make haste to be rich." And yet there lives not a sentient being but recognizes in his inner consciousness that this doctrine is dangerously and atrociously wrong.

We took occasion not long since to comment in a mild way on some of the methods made use of by the non-producing guilds to rake in the little money dabs of the laboring classes. Alluding to that modest effort, an interior journal observes that, while these methods are objectionable in a moral point of view, they are after all simply business, not running counter to the usages that largely obtain in most commercial and trade circles. Perhaps so. Certain it is, they do not much run counter to the usages that obtain with the bunco steerer and the burglar, which crafts regard also their vocations as simple business.

It is not a hopeful sign when the public conscience can tolerate or the public journalist write with complacence about things like these. Excuse them as we may, we have an idea that the man who makes his money through recourse to these sharp and cruel practices is weaving into the web of his existence colors that will not "run;" they will prove fast enough—so fast that they cannot be washed out with any detergent soap. It may even be doubted if blood would wholly erase them. We hold that it is a perilous thing to do a wrong that cannot be repaired. This, if any, must be the unpardonable sin. And how shall the man who robs indiscriminately, who reaches out and gathers in the pittance of the poor, ever be able to make restitution, however much he may desire to do so? This can never be done. The wretch may endow colleges and churches, set aside millions for the payment of post mortem prayers and masses; yet what can these avail, the victims of his inhumanity remaining impoverished and ruined? He may reach out and seek to rescue them, but he will find when it is too late that they have drifted away beyond his reach, and unless there shall be found in the resources of Divine wisdom some way in which these men can, in the hereafter, be enabled to make amends for the wrongs they have done, the hard old doctrine of eternal damnation will be likely to prove true enough.

The daily press having recently informed the public that a couple of convicts had made their escape from San Quentin, goes on to say there are now two violators of the law at large. It would be pleasant to believe there are only two!

Let it not be said we are sermonizing overmuch. We are simply dealing with well-known facts—performing a duty which, as the organ of the mining community, and in some sense of the working classes generally, we could not consistently ignore.



THE CUMMINGS ROCK-DRILL AND AIR-COMPRESSOR.

Prescott, Arizona.

We present on this page a cut of Prescott, the leading town in Northwestern Arizona, and county seat of Yavapai county, the largest political division of that Territory. Prescott was formerly the capital of Arizona, since removed to Tucson, Pima county. Though deprived of this advantage, Prescott remains the most populous town in the Territory and a place of much business importance, being the center of an extensive mining and agricultural region. There is also located here the military post known as the Whipple Barracks, the garrison at which serves to enhance the business and enliven the town.

Prescott enjoys the further advantage of being the southern terminus of the Prescott & Arizona railroad, a branch of the Atlantic & Pacific road, which it joins 74 miles to the north. As will be seen by the cut, the town is regularly laid out, the streets being straight and crossing each other at right angles. There are a number of handsome buildings in the place, some of which are not without architectural pretensions. The courthouse with its tall tower, seen near the center of the picture, is a fine edifice, having been built at a cost of $75,000. Prescott is increasing rapidly in both business and population, its future prospects being equal if not superior to those of any other town in Arizona.

For Compressing the Air and Piercing the Rocks.

A new invention, known as the Cummings rock-drill and air-compressor, is in the field, challenging the attention of mining men and contractors as well as inventors. For this device the proprietors claim a number of advantages owing to cost, weight, simplicity, durability and effectiveness. It is a compact, comparatively light machine, and runs with great smoothness, performing its work otherwise in a way that looks as if it might be able to make good some of its claims at least to superiority. We welcome in the field this new contestant for favor, not that we are without excellent machines of this kind already, but because its introduction is in the line of healthful competition and legitimate progress.

The Cummings machine can be seen at 59-61 First St., San Francisco, where the proprietors hold themselves in readiness to explain its construction and exhibit its working powers.

CHAS. G. YALE, our long-time associate, is returning Westward, and will soon resume his editorial chair.

Baer, Photo,

VIEW OF PRESCOTT, ARIZONA.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Prescott, Arizona.

EDITORS PRESS:—Prescott, the former capital of Arizona, is located a little northwest of the geographical center of the Territory. It is the county seat of Yavapai county, the largest subdivision of the entire Territory, embracing an area of nearly 30,000 square miles. This immense county—larger than many States in our Union—will doubtless be divided, and already the question of division is beginning to be agitated. But Prescott will always remain the principal city in Northern Arizona. It is already largely in advance of any other town in population, and it is the center of movements in business which will tend to further increase its relative importance.

Prescott is beautifully located. It is circled about by hills, but the site upon which the city is built is sufficiently level. The courthouse square, with its trees and greensward, stands in the center of the city, and ranged about this are the business streets. The courthouse cost $75,000, and it is a fine structure. It is surmounted by a tall tower, in which the city clock strikes off the hours as they come and go. Several of the merchants of Prescott have their business housed in good brick structures, and plans are perfected for at least a half-dozen similar buildings to be erected within a year. A good brick hotel was receiving its finishing touches during the visit of our correspondent. There are some beautiful and tasty homes in the more desirable quarter of the city, that of Ex-Governor Tritle being among them. The climate of Prescott can hardly be surpassed by that of any city on the Pacific Coast. There are 300 sunshiny days every year, as shown by signal-service reports, and the quality of the atmosphere is unequaled. The elevation of the city above the level of the sea is about 5000 feet, so that the air is pure and dry. Very little snow falls during the winter, and the ammeres are not excessively warm. Showers come during the summer, which keep vegetation green and lend a freshness to the landscape. The health and enjoyment of the people seem to be far above the average of people in most parts of our country.

Whipple Barracks, a military post of the United States, are but a mile from Prescott. The location is extremely pleasant, and the presence of the troops contributes not a little to the social and business importance of Prescott.

Prescott is reached by rail via the Atlantic & Pacific R. R. and the Prescott & Arizona Central, being at the terminus of the latter road, 74 miles south of its junction with the former at Prescott Junction. The Prescott & Arizona Central passes through immense stretches of stock and agricultural lands, and one cannot fail to have some appreciation of the future possibilities of Arizona as he rides across the fresh plains of this portion of the territory. Vast herds of stock are pastured here, while occasionally one sees cultivated areas which produce as fine fruits as can be raised even in California. Prescott is the focus of extensive mining interests. There are few institutions in the city itself which would suggest this fact, but nevertheless it is true. No great mills, with their thundering stamps, are to be found here. There is only one institution within the limits of the city which reduces ore, and that is a sampling plant. But within a radius of 60 miles there are innumerable properties, in different stages of development, some of which are now only prospects, while others are great ore-producers and dividend-paying mines, with mills or smelters turning out bullion. In this article we cannot enumerate more than a tithe of the better properties. We will first catalogue the leading mines or groups of mines, and then give detailed information as to a few of these. We may name first the United Verde mines (silver-copper) at Jerome, 28 miles north of east from Prescott; the Congress mine (gold), 55 miles southwest of the city; the Senator mine, 12 miles east; the Boggs and Hackberry mines (smelting ore), 25 miles southeast; the Ryland, 45 miles south; the Crowned King (gold and silver), 30 miles south; the Bell mine (silver smelting ore), in the Big Bug district, 17 miles southeast; the Prince mine and Tuscumbia mill (30 men employed), at Alexandra, 30 miles south; the Copper Basin, 10 miles southwest; the Rapid Transit, War Eagle, Silver King, and other properties in the Hassayampa and Bradshaw districts; also the extensive hydraulic properties on Lynx creek, 7 to 12 miles east; the Hillside mine, 18 miles west (now shipping gold and silver ore), also the Eureka copper mine, owned by same company and in same locality. Then there are the Baumann group of mines, 15 miles east, in the Black Hills (of which a description will be found in another part of our paper), and a great variety of properties in a similar state of semi-development. The location of the above and other properties will be made more clear to the reader by an examination of the accompanying map, prepared expressly for this number of our paper. As may be inferred, the map does not indicate one-tenth of the properties, but it will give the reader a general idea of the geography and extent of this region.

Besides the exclusively mineral properties, attention might be directed to an extensive onyx quarry, which has recently been opened and which has been noticed to a considerable extent by local papers and even by outside journals. This property is situated 25 miles southeast of Prescott, and covers an area of 200 to 300 acres. There are 11 claims. The onyx is taken out in slabs of almost any desired dimensions, the strata being unusually thick and well defined. Prof. Falkenau of San Francisco, who recently visited the mine, witnessed the blasting of a slab from the quarry, and he states that in all of his experience he has never seen a mine which equals this in respect to the enormous size of the blocks obtainable.

Although the rock taken from the mines in question is not, strictly speaking, a pure onyx, it yet has most of the qualities of that substance, being susceptible of a high and brilliant polish, which emphasizes the varied and beautiful colorings that may thereby be developed. It will prove a highly prized substance for the manufacture of table and bureau tops, mantels, etc., and when readily secured by the opening of the properties, and when its beauties become more generally known, it will meet with a ready sale and prove a profitable mine to its several owners.

While at Prescott, our correspondent could not resist the temptation to visit the great silver-copper mine at Jerome, known as the United Verde. The camp is but 30 miles from Prescott, but on account of the heavy grades in the road leading to the mine, a good part of one day is occupied by the stages in reaching this destination. For 20 miles the way is comparatively smooth, the road being through the low hills which inclose Prescott on the south and soon reaches Lonesome valley, an almost level stretch of country extending to the foot of the Black Hills. At Sanders Station, 20 miles from Prescott, the traveler will stop for a good, hearty dinner. From here forward the heavy work of travel begins. The next ten miles are a succession of steep grades, and for almost the entire distance the roadway is cut out of the sides of mountains, with frowning canyons extending hundreds of feet below. This road was an expensive one to build, and except for the great value of the property beyond, no company would have ventured upon the work of its construction. Arrived at the mining camp, we see the buildings of the company almost *hanging* upon a mountain-side. A site had to be graded for every structure. The few buildings in the town of Jerome, a half mile farther on, are similarly situated. The present plant of the company consists of a smelter containing two furnaces, rock-breakers, etc.; and there are also hoisting works, carpenter and blacksmith shops, mat-house, boarding-house, and several less important buildings. A reverberatory furnace is now being built, and enlarged machinery has arrived for the hoisting works, the former hoist being entirely inadequate to do the work required of it. There are roasting-beds on the side of the mountain, part of the ore being taken out of a tunnel on a level with these beds, and after being roasted returned to the shaft and there hoisted to an upper level where the smelters are situated. The mining operations throughout are not extensive, but are conducted under difficulties on the plane laid out by the former company. Most great mines become such by a system of evolution. The United Verde is no exception and is in its early stages. Despite the great disadvantages under which the discoverers of this ledge labored in opening their property, they persisted, full in the faith that they had a mine which would warrant the expenditure. They obtained their machinery and began operations. Their faith was at once verified. The mine made excellent returns. Eventually the present owner, W. A. Clark, Esq., of Butte, Montana, was induced to purchase the property, and now the work of evolution is progressing rapidly, because there is no lack of capital to prosecute all needed improvements. Besides the new machinery above alluded to (now about to be put in) there are to be built a system of tramways from the mine to Verde Station, where the ore and mat are at present shipped to favorable points for final working. The distance will be 15 miles or more. Through the mountain region it is proposed to have the tramway run upon a certain level to some feasible spot, and there a perpendicular hoist will be arranged to elevate the cars to a higher level. By a similar system, the cars will be lowered on the other side of the summit to the level of the valley in which Verde Station is located. These tramways will be the precursors of a steam railway, which will doubtless be built to the mine in the near future. At present the richer ores and the mat are freighted over the mountains at great expense by mule teams. The United Verde and adjacent mines in the same belt will fully warrant unusual expense in providing transportation facilities by steam, and by the time these are obtained we shall see at Jerome a more extensive, if not a more promising, camp than is now dreamed of. Other locations are soon to be developed, and the prospects are that the United Verde will be but one of a group of mines in the locality already made famous by this great property. The United Verde Company now gives employment directly and indirectly (as miners, teamsters, wood-choppers, etc.) to 300 or 400 men. The building of a railroad to the property will deprive a large portion of these teamsters of occupation, but by the time such an improvement is inaug-

The Gold Belt of California.

NUMBER I.

The Ancient Placere and Their Relation to Wall Rocks.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON, Kernville, Cal.]

There is a growing disposition to study the wall rocks of a metal-bearing lode and from that standpoint to endeavor to deduce some rule as to the mode of occurrence of valuable ore bodies throughout the lode. This study has been made to yield results with almost mathematical exactness in the Bonanza mine at Sonora, Tuolumne county, also at the Willard mine, near the town of Murphys, in Calaveras county. Some observations have tended to show a loss of silex in the walls of the lode in proportion as it appears in the lode itself. The porphyries of the mother lode are being studied, and in obedience to rules observed elsewhere, a higher percentage of gold is being searched for in the west wall of the Comstock.

Since the source from which the ancient placers were fed remains a mystery, the question arises as to whether light may be shed on the subject by the study of wall rocks. I know that all this is foreign to the idea that ore bodies are results of accidental eruptive force; but it only serves to remind me of a conversation I recently had with three mining experts who were discussing the richness of the "blue gravel" deposits, which, at certain points, have discharged their wealth into the South Yuba. After the immense treasure still stored there had been fully discussed, I asked the question which is made the subject of these articles, "Where did that gold come from?" One of the party, while looking to the others for acquiescence, said in substance: "Most of that gold came from lodes between soft and friable walls, and has been bottomed and removed by the eroding forces which plowed out the ancient channels. In some places the bottoms of the lodes are still left on the tops of the ridges, and in other cases lodes of great force are seen to-day, penetrating the earth to great depth." I reminded him that this idea was hardly in accord with accepted theories in the matter of a whole system of metal-bearing lodes having been bottomed by denuding forces. He responded that mining experts paid very little attention to accepted theories. Said he: "Your lodes here at Kernville are mostly in the granite, and that is the reason why so many of them pinch out at the bottom or in the gulches." If this reasoning is correct in regard to Kernville, then deeper mines should be found in the metamorphic rocks east of present exploration.

There are places where the metamorphic rocks extend to great depths below the beds of the ancient rivers, and there, at least, we should be entitled to search for a reserve from which the ancient channels were fed. As we turn to the history and circumstances of placer mining, we shall seem to see evidence that millions were supplied by a local source, and from the geology and configuration of the country that millions upon millions remain.

If any one not conversant with the facts was told that a little bit contained within two parallel lines running north and south, not more than one mile apart, had yielded nine-tenths of all the placer gold in California, which was contained in lumps worth more than $1000 each, astonishment would be the result. The surprise would not be lessened if told that the quartz mine of California which had yielded the largest lump of free gold in a quartz matrix was within the same belt. Still surprise would only be increased if told that it was a physical impossibility for any of these lumps to have been carried from any known quartz lode by natural causes. Now, after all that has been written about the mother lode, if we should turn to the scientist and say this was five miles east and up the mountain from the mother lode, we shall only be capping the climax. I believe all these propositions are within the facts, but before I specialize localities I must generalize a little further.

Original research is all that will enable us to master the unsolved mysteries of mining. Whoever will look at the attitude of the scientists 25 years ago in relation to the geology of mining, and will compare it with the position of the most advanced of standard authorities of to-day, will see that we have drifted, are drifting, and are almost without sail, rudder or anchor, so far as relates to the occurrence of the gold bearing matrix. When we find it we know where it is. Solomon, heathen as he was, knew that much. True, it has been said that some of the best gold mines in South America are between granite and diabase. But this only looks to the immediate contact. We must remember that the gold-bearing lode occurs in every kind of contact met with in metamorphic formations. If it has not been mined in recent years, I can go and show where a thin sheet of quartz rich in free gold appears in a solid ledge of blue limestone. This is the most impossible place for gold to be found in a gold region. I made this fact public and furnished specimens before the MINING AND SCIENTIFIC PRESS was founded. There was no capping, and the two rocks were as nearly "froze" as quartz and lime could be. My knowledge of that class of lime rock of which I have broken and handled thousands of tons teaches me that that vein was probably four or five feet deep and eight or ten feet long, and that the whole vein probably contained $20—possibly $100. Some scientists may question this statement. If any public-spirited man acting in a public capacity will call on me and ask me to do so, I will accompany him to that place at my own expense, and show him the spot, and probably obtain him a specimen showing free gold. This, too, is within that one-mile belt. Now what I want and what the miner wants, and what we must have, is a science which can explain the presence of gold wherever found—a science which does not have to be rewritten every third year. Before digressing in a subsequent chapter, I will say that the specimens referred to were furnished to H. C. Bennett, editor and publisher of the Columbia *Times*, and appropriately noticed by him.

There are several things relating to the history of placer gravels which may be learned by studying them. Where the gravel is well rounded and pretty uniform in size, the inference would be it had been driven a long way. When the gold was very much water-worn, the conclusion would be that it had entered the stream near its source. Where the pebbles retain more or less of their original angularity and vary very much in size, the inference will be that they were not driven far. Where the gold is rough and craggly, and in grains of every size from the finest flour gold to lumps of 50 or 100 pounds, the conclusion will be irresistible that they had not been transported very far nor long subjected to the assorting power of water. Water has a transporting power in proportion to surface exposed, and flour gold is nearly all surface.

These conditions have all been noted and commented on by miners engaged among the ancient placers. It is not hard to point out where $150,000,000 were mined within a few miles of a given point, and if the character of the deposit can be made to refer the origin of this wealth to a locality where the character of the formation bespeaks for it the proper place for deep and strong gold-bearing ledges, the rising generation may conceive it worth their while to turn their attention in that direction. Most of the placer-miners had very little knowledge of quartz, and had a vague and ill-defined idea that most of the placer gold came from volcanic eruption. They made no search for the gold-bearing lode, and since it would differ radically from a gravel deposit it might have been mined over, in many cases, unnoticed. The accessible placers were mined out. The miners had no families. Many were drawn away to the silver mines of Nevada. They neither perpetuated their own race nor imparted their knowledge to others, and to-day California can boast of but few able-bodied young men competent to manage a ground-sluice. The placers are neglected, and because these men, who knew nothing of quartz, mined over this ground, took out wealth and departed like the Toltecs, in search of the terrestrial paradise, the capitalists give this region the go-by. Canals which cost hundreds of thousands of dollars still pour their sparkling currents among gravel piles where the young pine has taken root and offers a lonely home to the cooing dove.

Over such a region as this there once swept a current strong enough to carry along a nugget of gold containing $8000, and remember that gold is more than once and a half as heavy as lead, and that the accompanying gravel was very little water-worn — two circumstances which can only be reconciled with the hypothesis that this lump had rolled but a short distance.

(*To be Continued*)

Letter from Arizona.

EDITORS PRESS:—I write you from a district that, having already attracted much attention by reason of its high-grade ores and peculiar character of its mineral deposits, seems to have a great future before it, as the following facts would tend to denote. The ore from the Vekol mine, which has been shipping since 1881, has shown an average value of $500 per ton, that being the valuation on which the S. P. R. R. Company based their freight charges. Eight carloads of this ore sent to Kansas City in 1882 yielded a total of $40,000. There are in the Vekol mine 2½ miles of tunnels, besides a great amount of shafting, drifts, etc. Miners acquainted with both localities claim this camp to be the Leadville of Arizona.

I have studied the district for nine years and know every foot of it. The ore is found in limestone, there being no signs of its presence on the surface except stains of iron. It occurs in a succession of chambers covered by a talo ceiling and dolomite flooring. One chamber alone, knocked down by two miners, yielded $35,000. The ore was originally discovered in the roof of the mountain ranging over a great basin. It pitches south and west, one chamber occurring after another in endless succession. As at Aspen, Colorado, you sink in the lime for it. The whole covering on the west and south side of the mountain is the same, and as a prominent mining authority remarks, if it exists in one place it will probably be found in many others, spreading out over many acres. We have splendid water facilities here and plenty of fuel. Southern Pacific R. R. 30 miles distant at Maricopa or Casa Grande.

NUMBER XIX.

[Written for the PRESS by JAMES H. CROSSMAN.]

Alvord Mining District.

Alvord Camp is sitnated in Alvord moantain, in tha central portion of Alvord district, at an alevation of 2500 feet above the level of the sea; distanoe from Daggett, 20 milss; from Camp Cady on the Mojave river, nine miles. Thls isolated moaatain range is usiaiportsat fn dimensions, hut to the practiced aye of prospector and miner it forms an attractive featare and one that warrants a careful examinatioa. Oa approaching the monntain from the Mojava river, on its soutberly flank a daap oanyoa is asen exposing its struotnral formation to a depth of aaveral huadred feet. Its make-ap is oomplex aad oomposed of many varieties of stratified rock—porphyry, syenite, micaceous schist, feldspathic rock aad calcareous shales—from tha yallow magaesian stone to a coarse-grained carbonaosous marble, conrsiag northeasterly and sonthwesterly, and dipping easterly at an angle of 45 degrees. From the mouth of this canyon, lu u northwesterly direction, and at a distance of 3000 feat, we reach the

Alvord Mine.

The vein here cuts the formation at u right angle. The gangue is a jaspery quartz carrying free gold, mnch of it visible to the naked eye. Select pieoss are often sufficiently rich to be used for lapidary parposes. The footwall of the veln is composed of a secondary ayenltio rock seamed and banded with olvine, its hanging-wall being a ooarse-grained carbonaceous lime throngh which courses st varying angles wfth the trend of the vein, feeders and stringere of oalcspar often found rich fn gold, for a distance of from 30 to 40 feet from the main lode. The ores extracted from the mine have been selected and hanled by freight teams to the oompany's mill at Camp Cady, nine miles distant. The yield is reported hy the owner of the mine (Mr. J. B. Osborne) to have varied from $40 to $140 per ton. Large quantities of the lower-grade ores remain in place and on the dump, their values varying from $5 to $8 per ton. The vein, which varies in width from 3 to 18 feet, is traceable hy developments and o.oppings for a distance of 2000 feet—its greatest expansion being near the canyon. The main ohnte or ore body has a longitadinal extent of 115 feet and an average width of 12 feet.

Thia mine has been opened by an adit driven from a point 40 feet above the bed of the canyon in a westerly direction on and fn the vein for 350 feet, connecting with Shaft No. 1, 103 feet from the anrface; thence for a distance of 78 feet, connecting with Shaft No. 2, which is 110 feet deep; thence easterly 40 feat, a shaft has been sunk 35 feet deep in an ore of low grade.

At Camp Cady, nine miles distant, a mill has been erected contsinlng five stamps and two of the largest size Hnntington pans, which are kept steadily at work.

No water appears here on the snrface except after heavy rains, bnt the poroos sands of the lake-bed, like a sponge, contain a large percentage of water, as has been demonstrated hy a number of wells sunk here from 5 to 12 feet in depth.

Joe Dandy hill, which forms a central point of thls mineral district, is situated 30 miles north of Ludlow Station on the A. & P. R. R., and 10 miles northwest of Soda Lake Station on the old overland stage-road, at an elevation of 3200 feet above the level of the sea.

Near the westerly border of the district, a low mountain range occurs, conrsing northerly and sontherly. It is 20 miles long by 4 in width. In fts southerly extension at Cave Springs, the Mojave river having eroded a passage, finally sinks in Soda lake.

Two hundred and fifty miners' inches of water oan be obtained at Paradise valley, three and one-half miles distant, at a sufficient elevation to oonvey it to the mouth of the oasyon.

Solo Mining District.

Whfch appears to oontain all the elements of snooess, oomprises within its bonndary linee a enperficial area of 432 sqnare miles, of which the bed of Soda lake occupies a space of 36 sqnare miles—this oonstituting an inexhaustible sonroe of water supply. From this point the make-up of the range is largely of an eruptive character, in combination with sqneous rocks. Porphyry in immense dykes cuts the formation, as well as the several varieties of limestone. Magnesian, carbonaceons and blue limestone is everywhere seen. Profnsely capping the metalliferons veins or coursing with them as incasing walls, lithological growth and decay is everywhere present, the geological structure being sufficiently varied to embody a history of its own. At points where the mines are located, disintegration has performed an important part in exposlag the ore bodies along the lode. From the summit of the hill, extending downward in an easterly and sontheasterly direction, the mineral ontcrop covers a enperficial area of 500,000 square feet. Where denudation of the lime cap or blossom has not taken place, exposing the ore body, the cap of lime presents a smooth, unbroken surface everywhere stained and discolored hy the hydrated oxide of iron and the metallic oxides, demonstrating the presence of the metalliferons product at greater depth—the cap lavariably yielding low assays, hut wherever penetrated, high-grade ore is found. Tha ores are argentiferoas galena with their sacoadary products—carbonates and sulphates of lead aud chlorides and salphfdes of silver. The gangne is silicious, calcareoas, aad both overlaid and nnderlaid hy porphyry and limestons. At the point of tha greatest expaasloa, a blue limestons forms the anderlie. Tha names of the principal mines or locations are as follows: The Gambetta, Lydia Hatzel, Grant (Gift), New Year's, New York, 1XL, Homestake and Frijole—there being in all 14 locatidas.

The Gambetta.

Which lies on the eastern slope of Joe Dandy hill, forms the sontherly exteasioa of the New Year's, lyiag parallel with tha Grant (Gift) aad Lydia Hetzel, which lie oa the western flanks of the hill—the intervealng spsca being mineralized, showing spots, bnaches and stains of ore in the croppings. A notable featnre, and one that is indicative of extensive ore bodies in depth, is that from the surface down to a depth of froia 4 to 40 feet, the cap rock only yields hy assay from 5 to 10 ounces silver per ton and from 5 to 6 per cent lead, while below that point the value of the ore rapidly appreciates, retnrning assays varying from 60 ounces silver to $5 to $15 gold valnes and from 30 to 40 per cent lead. In the Lydia Hetzel and Graot (Gift) the vein matter shows on the snrface a widtu of 120 feet; also in the Gambetta and New York. From the highest point on the hill where the fedge fs exposed to the lowest point of exposure, the vertical difference is 500 feet. A large number of assays taken from various points in the mines yielded from 50 to 275 ounces silver per ton, with a *ley* of gold and from 30 to 50 per cent lead. Hand-picked specimens run as high as $13,000 per ton. It is safe to say that the entire ore body will yield 50 oances of silver and 40 per cent lead. Crossing the sontherly apex of the hill is a porphyritic dyke, which, with its oompanion strata of lime, is 1000x3000 feet—this formation being also mineral stafned, showing the thorough mineralization of thls section.

Developmente.

A tunnel from the north side of the hill has been extended sontherly for a distance of 500 feet and will requlre to be carried 100 feet farther to reaoh a point nnder the main ore channel. The Camphell tnnnel, which has been driven 75 feet sontheasterly through the ooantry rock, intersects the Lydia Hetzel lode at a vertical depth of 70 feet, crossing the vein for a distance of 17 feet. The first 7 feet fs free-milling ore carrying 50 oz. silver, $15 in gold valnes and 10 per cent lead in the foim of a carbonate. The next 10 feet carries 40 per cent carbonate of lead with small values in the precious metsl. This is known as the first west lode, and is separated from the east parallel lode by ten feet of porphyry (evidently a horse). The osprock is invarlably hard, but when cut through the formation it is found to be soft and much decomposed.

Developments on the Gambetta consist of a 12-foot shaft; 50 feet farther west a 12-foot crosscut has been driven in the veln. In both of these free-milling ore oocnrs.

From the Gamhetta, 1½ miles in an easterly direction, another and distinct group of miues occurs, on which oonsiderable work has been done, the mineral contents being of the same general charaoter as those of the Gsmhetta, with the exception that the ore here carries argentiferous copper in the form of glance. Select samples of thls ore have assayed up in the thousands. Wood and water occur in abundance at a point seven miles distant from these mines—the road thence being down-grade to the site seleoted for reduction works. Strange as it may seem, this promising mineral sectfon is hnt little known ontside of the distrlot in which it occnrs. The owners are men of limited means, bot being firm believers in the fnture of their property, will hold it for the advent of the "iron horse," which sooner or later will traverse these desert regions.

Five Point District

Adjoins Solo district on the north and is situated in the same mountafn range. In thls district ten other locatioas have been made—the formation, charaoter of veins and ore being similar to that of the mines already de scrlbed.

(To be Continued.)

MINING IN CHINA.—The Mo-ho gold mines in China now employ over 10,000 men, mostly natives of Shangtung. There are four mines. The Goveroment takes four-tenths of the gold extracted, the remaining six-tenths going to the miner. Sometimes a man will get none out of a whole day's work; at other times several ounces will he obtained. The regnlations are very strict, and any theft is severely pnnished. The machinery employed is not got from abroad, hnt made in a factory near the mines. It is thonght that with European machinery the output wonld he much larger.

COOLIES FOR WORK IN MEXICO.—The new line of steamships hetween Mexico and China has begun operations. The first three steamers will bring ont 2000 coolies for work on the Tehnantepeo railway. It is probable that many of these laborers will remain in Mexico, which is in great need, especially on the coast, of a snpply of cheap labor. The Monterey & Gulf railway will soon be in full operation between Venadito and Victoria, the capital of the State of Tamaulipas.

The Utilization of Niagara Falls.

A contract was awarded on Saturday last to Rogers & Clemens of this city to construct a tanal parallel to Niagara river for the Cataract Construction Co. The consideration involved is not announced. A bond fn the sum of $300,000 has been executed by the firm. Work will be commenced immediately aad must be finished in January, 1892.

In 1886 the Niagara River Hydraulic Power Server Co. was incorporated by a special Act of the State Legislatnre. At various times the charter was amended, and the name finally changed to that of "The Niagara Falls Power Co." In July, 1889, this company awarded the Cataract Construction Co. the contract to construct at Niagara Falls works which will develop 119,000-horse power. Since that time the contractor has been preparing plans and specifications for the work; the sub-contract just awarded is the first decided move which proves to the public that the preliminaries are nearly finished, and that it is certain the works are to be built. At the present time the contractor has a commission in Europe studying plans of plants of similar nature with a view of ascertaining the most practical method of constructing the Niagara plant.

Up to date, plans for any portion of the plant, excepting the tunnel, have not been adopted; consequently the manner of connecting the tunnel with the upper river is not known. There will, however, be a canal either with or without a series of traverse surface conduits, which will conduct the water to penstocks and thence upon turbine wheels. The tunnel, which is to be merely a tail-race, will receive the water from the turbines conducting it below the Falls. The details upon which this tunnel fs to be constructed are at hand. It is to start at a point below the Falls under the suspension bridge, extending through the rock to the upper river to a point 6700 feet from its month, where a head of 120 feet will be obtained. It will be 28½ feet high, 18 feet wide, with a semi-circular top of 9 feet radius, and straight sides. The fall will be 36 feet to the mile.

The company owns 225 acres of land along the river suitable for millsites, 75 acres under water adjacent to said land, and 1100 acres lying back from the river about midway between La Salle and Niagara Falls. It has been estimated that the flow of water over the Falls amounts to 12,785,455 cubic feet a minute. To develop 119,000 horse power with a 120-foot fall would require hut one-fifth of 1 per cent of this volume. From these figures it will be seen that the power is almost inexhaustible. If this plant soon to be constructed proves to be a success—and there is no reason to believe that it will not—the power now running to waste, reaching a figure almost beyond the comprehension of the mind, can be utilized by additional plants of similar nature.—*N. Y. Engineering and Mining Journal.*

THE HUDSON RIVER TUNNEL is being pushed as rapidly as possible from the New Jersey side; about 150 men are now employed and the progress is more rapid than formerly, being about four feet a day. Some 350 feet of iron tunnel is now finished, in addition to the reconstructed portions of the old enterprise. Work on the New York side has practically ceased for the winter. The old tunnel has been strengthened and a bulkhead built at its end. The present intention is to build the shield for this heading on the shore and sink it into position in front of the bulkhead in the spring. Unless satisfactory arrangements can be made with the French steamship line, which runs the docks above the tunnel, this plan will not be possible, as the shield will have to be sunk directly in front of the entrance to their wharves, and the vessels will thus be prevented from using the docks for some time.

IMMIGRATION continues to increase, and is very large, a sure indication of probable "good times" for some months at least. For September it is 18 per cent larger than last year; for the seven months ending with September, 12 per cent larger. The increase is largely from Italy and Poland, hnt less decidedly so than it was some months ago. British emigration now constitutes about one-fourth instead of one-third of the whole. The Canadian emigration is not recorded, owing to lack of provision for accurate records, but is really something like one-sixth of the total immigration, there having been in 1880 nearly as many Canadians as English and Scotch living in this country.

NEW YORK STREET CLEANING for the quarter ending Sept 30th, cost $264,411.86, or $105,359.12 less than for the first quarter of 1890, and $83,111.95 less than for the second quarter. The area swept aggregated 314,179,328 sqnare yards, and 355,461 cartloads of ashes and garbage were removed. Of this, 19,850 loads were used for filling city lots and the remainder carried to the sea. The city received $13,886.60 for the privilege of trimming the scows. Fines amounting to $3938 were collected.

THE phosphate mines of South Carolina afford more revenue to the State than ordinary gold mines. The royalty of $1 a ton on the rock removed from navigable streams for the year just ended amounts to $237,150, or $25,000 more than last year's income, and the highest on record.

Successful Trial of an Admirable Steam Road Wagon.

An inveation which is bound to prove of much importance to Western lumbermen, farmers and mine-owners, has been tested at the Atlas Iron works at the Potrero. The invention, patented by Californians, consists of a steam road wagon, which promises to revolutionize freight-carrying in districts remote from the railroads. This machine is the patent of Captain Roberts of the Sacramento Transportation Company, and differs materially in construction from any road wagon or traction engine heretofore invented. The usefulness of the old-style steam wagons is almost destroyed for mountain travel, or for work where numerous turns are necessary, owing to the fact that the steering apparatus is too complicated and the power is indirectly applied which prevents the maintaining of any considerable speed without the use of an immoderate amount of fuel. There has for years been a demand among farmers for a road wagon that would do away with the necessity of using horses, which in many localities require one-third of the profits of a ranch to maintain. This trial of the new invention demonstrated the fact that the machine will in the near future be in general use as a freight hunler. It was constructed at the Atlas Iron works for Messrs. Bradford & Way, of Sonora, Tuolumne county, for hauling lumber over the mountains, and is the second of the kind manufactured by that company. The wagon is constructed entirely of wrought iron and steel, there being no cast iron except in the cylinders. It has three traction wheels made of cruiser steel, to which power is applied directly, exactly as on a locomotive. The steering wheel supports one-half of the weight of the machine, and works on an axle horizontal to the axle of the rear wheels, so that the same pistons drive all three wheels. The steering wheel is, however, so constructed with a ball-and-socket joint that the application of power is continued even while the machine is turning at a sharp angle. The truck in front is connected by a hydraulic steering apparatus, which swivels on the ball and joint. The machine weighs about 16 tons and can develop a 225 horse-power and a speed on level ground with a light load, of from eight to ten miles an hour. The intended speed for all occasions, however, is about four miles an hour.

The trial was under the supervision of Capt. Roberts, the inventor, General Manager Jardine of the Atlas Works, Supervisor Noble and S. S. Bradford of Bradford & Way, and the test was a severe one. The trial course was over a distance of about 2000 feet, up a grade of about 10 feet rise to the 100 linear feet. To the machine was attached five wagons weighing two tons each and loaded with 40 tons of pig iron. The machine was started with a steam pressure of 155 pounds, and pulled the enormous load over the course without a stop, having on 185 pounds of steam at the end of the course.

The machine will be shipped to Sonora and will haul 20,000 feet of wet lumber at a load. The wagon bids fair to come into general use on the plains and in the mountains where the engines heretofore have proved too complicated in construction and too cumbersome for general use, while the power applied through gearing was not sufficient for ordinary purposes, and the speed was unsatisfactory.

UNION PACIFIC EXTENSIONS.—As regards the probable extension of the Union Pacific into California, the present situation appears to be like this: The company have made surveys into both the northern and the southern parts of the State, but as to actual extensions nothing has yet been certainly decided upon. The surveys into Northern California were completed some two years ago. The surveys into the southern part of the State were made recently. Three surveys were run, all from Ploche, Nev., southward. One runs to Homer, and another to Ludlow, points on the Atlantic & Pacific road. The third survey runs to a point on the Southern Pacific railroad. All of these surveys were made to furnish to the directors of the company information about the State. At the present time the company is building about 555 miles of new road. The extension from Milford, Utah, to Pioche, Nev., a distance of 145 miles, will be completed by Feb. 1, 1891. Another of our important new roads is the one from Portland to Seattle.

SCARCITY OF NICKEL.—The nickel appropriation of $1,000,000, as ordered by the late Congress for armor-plate, has resulted in the discovery that there are only about a dozen nickel mines in the world, and only three are on this continent. The output of these mines is doubtful, and one source may not be sufficient. Other nations may also see the advantages of the new alloy, and it is said that Krupp's representatives already seeking to gain possession of the Canadian mine. The other two American mines are in Nevada and in Lancaster county, Pennsylvania.

A SCHEME FOR PROTECTING RAILWAYS FROM FLYING SAND is suggested by Prof. Schubler, a German botanist. He proposes to use the roots of the plant *triticum repens L.* The roots are cut in a machine into lengths of 20 centimeters, mixed with a little earth, clay and water sufficient to form a dough-like mass. This is spread with a spade over the sand, and in a couple of weeks it begins to spread and bind the sand.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—*Ledger*, Nov. 5: Laying of the 15-inch flanged steel pipe at the Wildman mine is now finished. The work was done by experts at the business. The joints between the flanges are all lead-corked the entire 2000 feet, and five or six ¾-inch bolts to hold the joints in place. It has been pronounced by the best of judges to be the best job of the kind ever done in the county. The hoisting works will be detached from the old pipe in a few days and it will run the mill exclusively, which will give the mill and machinery a more even motion, and is bound to give better results. The mill will be started about Nov. 10th, instead of December as mentioned in last week's letter. Cros cutting both east and west still goes on in the North Star. The ground is still hard and breaks slowly, and there is nothing encouraging in sight as yet. As the lay of the ground renders it very uncertain as to where the ledge should be, they feel that a favorable change might set in at any time. At the Rose mine they still continue to drift south. They are nearing where something good is looked for, but will continue, however, for some time yet. Enlarging and putting the Lincoln ditch in good order for the winter run is finished and the mill will be started up again in a few days and will likely be kept running steadily through the winter.

PLYMOUTH. — *Dispatch*, Nov. 4: The Pacific mine is working but a few hands at present, and no one seems to know whether it will improve in this respect in the future or shut down altogether. The New London is pursuing the even tenor of its way with a full force of men, and all its stamps going, so we may reasonably conclude it is paying well.

Mariposa.

WHITLOCK MINES.—*Gazette*, Nov. 1: The two-stamp mill of Helm Bros. is running in full blast. Its capacity is about three tons in 24 hours. That little mill has pounded out in Whitlocks over $100,000. Ellingham & Grove are running their mill on a 100-ton lot of ore that is paying remarkably well. Ward & Brother have started up the Whitlock mine with excellent prospects. The Reed, the Hayseed and the Ward Bros.' mines are all making profitable runs. Mr. King has bought out Mr. Curtis' interest in the claim that yielded the 24-ounce chunk. Mr. King is ruoning a hand mortar on his pocket mine.

Nevada.

PENNSYLVANIA MINE.—*Tidings*, Nov. 6: Work on the new hoist at this mine is being pushed rapidly, the building being 80 feet long and well constructed. It has been covered with a redwood shingle roof and this has been painted and presents a fine appearance. The work of retimbering the shaft has been done in a first-class style. The machinery is in good condition and there are about 150 cords of wood on hand. Space has been left on the north side of the hoisting works for a ten-stamp mill which will be procured in San Francisco.

STRUCK PAY GRAVEL.—The Centennial Mining Co., prospecting on the Washington Ridge, has finally struck pay gravel at a distance of 800 feet from the mouth of the tunnel. The gravel was struck by making ao upraise of 14 feet from the tunnel. The company has been very energetic in carrying on the work notwithstanding many drawbacks.

COE MINE.—The appearance of this mine since it has been pumped out is satisfactory to the company that has taken a bond on it, and they are willing to go on with further expenditures in developing the property with the intention of finally taking it under the terms of the agreement with the owners.

VARIOUS MINES.—*Transcript*, Nov. 7: There is renewed activity in mining in this district. The Nevada county mill is kept busy crushing custom rock. The new hoisting works of the Federal Loan mine are nearly completed. The prospects at the Manhattan are exceedingly good. About 20 men are employed at the Nevada City mine and the prospects of its coming to the front again are very encouraging. The Mountaineer and Champion are looking spleodid, and the latter is paying dividends with great regularity. Negotiations are pending for the sale of the North Banner quartz mine of this district. The ledge at the Gold Bank tunnel is improviog with every stroke of work dooe upon it, and the discovery of a large body of ore is looked for soon. Supt. Lord is making good headway at the Original Spaoish mine on Deer Creek below town. Pumps are to be put in and the shaft which is now down 150 feet is to be sunk another 100 feet. Tributers who have been taking out the ore will have a cleanup this week. The strike at the Harmony drift mine oear this city will have a powerful influence in advaocing the value of otber claims in tbat locality and in stimulating their development. The Cold Spring location on one end and the Milliken claim on the other will doubtless soon be heard from in a substantial way.

ANOTHER RICH FIND.—Henry Kohler and Thos. Van Oudshoorn of Washington, while doing assessment work on one of their claims six miles above that town on Canyon creek, have struck a large ledge tbat is said to be the richest ever found in that section. They estimate it will pay $100 to the ton.

WASHINGTON RIDGE.—*Herald*, Nov. 4: The wealth that exists on what is known as the Washington ridge, extending from Sugar Loaf mountain to Omega is untold, but we believe there is enough to load three or four ships. At the extreme ends the ground has been proven to he fabulously rich. The lead was worked partly out in the Manzanita, Live Oak and Nebraska claims, and between $3,000,000 and $4,000,000 taken out within 3000 feet, and on the outskirts of the main lead between $1,000,000 and $2,000,000 were extracted, and all previous to the year 1860. Since then little has beeo done except in the Manzanita claim, which was for a time worked by hydraulic process. The early working was all done by drifting. The impression in the early days was the same that it is now, viz.: that the chaonel extends up the Washington ridge. The Harmony Co. struck the channel 20 odd years ago, a mile and a quarter above the Nebraska ground, and took out $60,000, but having started in on the wrong side of the ridge, and not having depth enough to their drift, could not work the ground profitably. Recent developments there show that the channel is the same as below, and indications all plainly point to its extending up the ridge. There is a vast field for prospecting companies for a distance of six or eight miles, and there is but little doubt that the now idle ground will be explored in the near future. There is no better place for prospecting operations in California.

NORTH BANNER MINE.—*Tidings*, Nov. 10: This property continues to yield remuneratively, and from the outlook will develop into "a big thing." It is understood that the company could have paid a dividend some time ago had the directors desired, but the surplus has been devoted to substantial improvements aod to the purchase of a full stock of supplies for the winter and early spring. That regular dividends are in store for the stockholders is almost assured.

THE W. Y. O. D. MINE is fast coming to the front as one of the paying mines of the district. A crushing of 84 tons of quartz, occupying 20 days, yielded about $40 per ton. To-day was pay-day, and everybody seemed happy. There are about 25 men employed about the mine. A new seven-inch pump is being placed in the bottom. The drifts are being steadily pushed ahead and there is a good ledge on each side of the shaft.

HARMONY GRAVEL MINE.—Grass Valley *Union*, Nov. 11: The strike in the Harmony gravel mine near Nevada City has sent up the stock from 20 cents (which went begging at that price) to $10 per share. Prospects of 75 cents to the pan have been taken out in the last few days. This strike is the most important, in gravel, that has taken place in the vicinity of Nevada City since the early days of mining, and gives great encouragement as to the future. The channel is known to be extensive, being considered as the same that traverses the county from You Bet to the north side of the Yuba. This strike will be the means of starting other prospecting operations on the chanoel on each side of the Harmony location.

ANOTHER DRIFT MINE.—*Transcript*, Nov. 10: The Fountain Head Gravel Mining Co. is being reorganized at this city to work the drift claim on the Washington Ridge adjoining the Cold Spring. A. Isoard, E. Muller, I. J. Rolfe and B. C. Waite are the principal stockholders. The recent rich strike in the Harmony claim on the same lead and near by, has revived confidence in the Fountain.

A GOOD PROSPECT.—A crushing of quartz from a location on Cemeot Hill, northwest from Nevada City, belonging to George Fletcher and John Skewes, gave over $15 in free gold to the ton. The sulphurets assay over $1600 to the ton.

Placer.

MINING NOTES.—*Republican*, Nov. 1: Since hydraulic mining has been suspended much interest has been taken in other kinds of mining the past two years with good success. We expect to see the mining interest once more flourish and be again recognized as the foundatioo of every industry of the State, and those now that are its most bitter enemies will be its warmest advocates. The Tai Sing Co. of Indiana Hill declared a dividend last week of $26,000 on their entire stock for the past year. The company will soon erect a 20-stamp mill near their works to overcome the heavy expenses of running their cement the great distance they are now doing.

Shasta.

CENTERVILLE.—*Democrat*, Nov. 5: Peter Cowen and Sheriff Hopping's mine is located about one mile below the postoffice on Tadpole gulch. Mr. Cowen has erected a good cabin on the ground and is making other arrangemeots by which to further develop this ledge. This property has been prospected hut little, but sufficient to induce him to spend time and money in further developments. The ledges are in a contact formation, being porphyry footwall and slate hanging-wall.

LOWER SPRINGS.—Walton, with a small crew, is working on the property of L. Y. Smith on the north side of Middle creek. Copeland thinks he has the biggest mine in Shasta county.

MOUNTAIN VIEW.—This mine is on the southeast slope of the mountain, lying between Iron mountain and Harrison's ranch on Whisky creek. Their house and shaft are located on the west side of their tunnel. A persoo can almost locate the tunnel by looking from Shasta and other points from this place. The ore assays up in the thousands. Take it on an average will go $15 to $20. They have abundance of wood, also 30 or 40 inches of water the year round.

Sierra.

ABOUT SIERRA BUTTES.—*Tribune*, Nov. 8: The mill at the Mountaio quartz mine is ready to run, and as sooo as the tramway is in working order the stamps will begin crushing the precious ore for all it is worth. The Mountaineer M. Co., T. Berger, Supt., has purchased ten stamps complete out of Yuba mill, from the Sierra Buttes Co. The ore of this company averages well. They are building a mill, boarding-house, blacksmith shop, stable, and have just finished a cottage for the superintendent and family. Employment in this mine is giveo to 30 men. Three additiooal stamps have been put in the Wm. Tell mill, aggregating eight, and rock averages good monthly cleanups. Times are slowly but surely improving at Sierra City and adjacent mining camps, well merited by the energetic and public-spirited citizens of this rich mineral region.

Trinity.

VARIOUS LOCALITIES.—*Journal*, Nov. 8: William Berry came up from Oakland last Friday to put up the mill on the Chloride mine, Canyon creek, for the Fisher Gulch Mining Co. Mr. Taylor has done considerable prospecting for quartz in the neighborhood of the South Fork of the Trinity, and has found one lode of which mention was made io the *Journal* some months ago. There has been considerable mining along this stream, but it never was a paying stream, although a few good spots were found from time to time.

Tuolumne.

BADGER MINE.—Union *Democrat*, Nov. 8: It is reported on good authority that the developments on this mine are showing fine. The mine, which is situated about five oriles below the Raw Hide, to the west of the Mother Lode, has lately passed into the hands of San Francisco parties who are energetically developing it.

SOULSBY MINE.—Work on this mine will soon be resumed by English parties. The Soulsby has been extensively developed and yielded in the past hundreds of thousands of dollars. The news of resumption of work on this mine will be hailed with pleasure by the entire county. It means another industry and a successful one in the opinion of those who know its history and record.

RISING SUN MINE.—A rock-breaker has been recently sent to this mine and the mill will soon start on good ore. It is contemplated to add five more stamps to the mill.

THE COLBY.—*Independent*, Nov. 8: On Thursday, 3000 feet of pipe for the old Colby mine reached town. The pipe will be used for the conveyance of water from the ditch for the working of the mine, to replace the present steam-power. This is no doubt the most promising pocket mine in the county, and under the efficient management of Superintendent Kelley, golden results may be expected.

NEVADA.

Washoe District.

CON. CAL. & VA.—*Territorial Enterprise*, Nov. 9: 1200 level: Continue the extraction of some milling ore along the line of the north drift. 1300 level: Ore of a fair quality is still being extracted from the junction with the upraise. 1500 level: Extracting some ore io drifting northeasterly from the junction with the upraise 260 feet north from the Con. Va. shaft. 1600 level: Have contioued to extract ore along and above the line of the drift run east through the old stopes on the sill floor of this level. We are also working southerly from this drift, stoping out ore. 1650 level: From the various openings we have taken out ore of the usual quality and quantity. From the north lateral drift from the Con. Va. shaft an upraise has been carried up to and connected with the most southern workings on the sill floor of the 1600 level. 1750 level: The southwest drift from the main west drift has been extended to 256 feet, showing quartz of low assay value. There has been extracted during the week from all parts of the mine 1611 tons of ore, which was shipped to the Eureka mill. Average assay value of all the ore worked at that mill during the week (1575 tons), was $19.10 per ton.

OPHIR.—West drift, 1300 level, is extended 51 feet in low-grade quartz. Assay value of bullion shipped to the Carson Mint, $32,205.

SIERRA NEVADA.—The southwest drift, 630 level, has been advanced 47 feet in a soft porphyry formation, showing some seepage of water.

UNION CON. — East crosscut No. 2 from the north lateral drift, 1465 level, extended 25 feet—total length 210 feet, still in hard porphyry.

MEXICAN.—On the 1465 level an east crosscut, No. 1, has been started and advanced 26 feet io a soft porphyry formation.

OVERMAN.—During the past week extracted 364 tons and 1000 pounds of ore. Bar sample assays average $19 per ton. Shipped to the Brunswick mill 378 tons 930 pounds of ore. Battery samples average $43.85 per ton. Northwest drift on 1100 level has been extended 16 feet through good ore running from 4½ to 5 feet in width. Total length, 84 feet. Have timbered 25 feet of the southeast drift. Have resumed work in the northeast drift 54 feet above the 1200 level.

SAVAGE.—During the week hoisted 836 cars of ore from the 500, 600, 750 and 1300 levels. Shipped to the Mexican mill 460 tons of ore and to the Rock Point mill 384 tons. Milled during the week 820 toos, the average battery assay of which was $20.63 per ton. Have bullion on hand amounting to $53,696. Southwest drift, 1300 level, advanced a total distance of 156 feet; face in fair-grade ore.

HALE & NORCROSS.—Prospecting and development work on the 800, 900 and 1100 making usual good progress with no change of importance to mention. Have nearly completed the repairs in the north compartment of the vertical shaft to the 1300 level; have finished the station and expect to resume work below this level io the iocline during the coming week.

CHOLLAR.—The upraise 60 feet south of north line, 800 level, is up 62 feet in hard porphyry. During the week have been excavating for a chute on the 1300 level. Extracted aod sent to mill during past week 438 tons of ore, average battery assays $21.41.

POTOSI. — East crosscut 50 feet north of the winze station, 1130 level, is out 21 feet, the last 10 feet in quartz giving fair assays. East crosscut 50 feet south of the winze station, 1180 level, is out 24 feet, and has passed through several streaks of quartz giving fair assays. The 1230 winze station is about completed.

UTAH.—725 level: The maio south drift has been extended 56 feet; total length, 769 feet. Formation, soft porphyry showing some clay.

GOULD & CURRY.—The oorthwest drift on the 200 level has been extended to 15 feet. Formation, quartz showing some value. Oo the 250 level east crosscut No. 1 has been extended to 30 feet. Formation, quartz of fair quality. On the 400 and 450 levels from the old stones have extracted 45 toos of ore of fair quality. On the 625 level all work has been confined to repairs.

BEST & BELCHER.—On the 800 level west crosscut No. 2 has been cleaned out and repaired 120 feet; total distance, 220 feet. On the 1200 level all work during the week has been confined to repairing the north drift.

ALTA.—Crushing 315 tons weekly of $18 rock, as per battery samples. The stopes are yielding as usual, and the raise and drifts above the 725 level are looking promising.

CON. IMPERIAL.—Exploration aod ore prospecting work go forward as usual on the 450, 750 and 1000 levels. The face of the various drifts and crosscuts shows porphyry and quartz of no value.

YELLOW JACKET.—Shipping 78 tons of $18 ore daily to the Brunswick mill and doing extensive prospecting work throughout the mine.

SILVER HILL.—Drifting on the 160 and 334 levels io hard porphyry.

KEYES.—Two new hoilers are being put in and the machinery arranged for active resumption of work in the mine.

SCORPION.—Southwest drift on the 600 level still running in porphyry with clay seams showiog no change.

CONFIDENCE.—General repairs throughout the mine preparatory to prospecting for ore are still going on.

WARD COMBINATION SHAFT.—East drift from the 1800 station is out 675 feet; face in quartz and porphyry.

CHALLENGE CON. — The joint Confidence aod Challenge west drift on the 1000 level is out nine feet, face in a mixture of quartz and porphyry. Joint Challenge-Imperial west crosscut No. 1 on the same level is out 28 feet; face in porphyry. Joint Yellow Jacket and Challenge east crosscut No. 1 on the 1000 level is out 50 feet; face shows porphyry. Joint Confidence-Challenge north drift on the 300 level is in 42 feet; face in quartz of no value.

SEG. BELCHER.—The north drift on the 850 level is steadily advaocing with its face in low-grade quartz.

ALPHA.—East crosscut, 600 level, is out 143 feet; face in quartz giving fair assays.

EXCHEQUER.—Drifting and crosscutting on the 500 and 600 levels, making good progress; faces in quartz, clay and porphyry.

CON. NEW YORK.—Drifts north on the 650, 800 and 1100 levels running io porphyry, except the latter, which shows streaks of low-grade ore.

KENTUCK.—The 1000 level east drift has been extended to 10 feet; face in porphyry. It is the intention to connect this drift with one now being run from Crown Point. Face of west drift on same level is io a mixture of clay and quartz. The south drift on the 950 level is out 22 feet in low-grade quartz.

WEST CON. VIRGINIA.—The repairs to the shaft are rapidly progressing preparatory to deeper sinking.

ANDES.—North drift on the 420 level advanced during the past week 18 feet. Formation principally quartz. South drift from west crosscut No. 1 was extended 10 feet; formation porphyry and quartz.

BELCHER. — Usual prospecting work reported. Shipped 275 tons of $22.14 ore, as per battery assays.

CROWN POINT.—The southwest crosscut on the 1100 is out 28 feet, having been extended 17 feet during the week. It is still in old ground. Shipped to the Mexican mill 380 tons of $12.54 ore, as per battery samples.

OCCIDENTAL CON.—The stopes on the 350, 400 and 450 levels are yielding 40 tons daily of fair-grade ore. The crosscut on the north line, 650 level, is in 25 feet, showing some low-grade ore. During the week the mill has worked 270 tons of ore of the average value of $21.10 per ton.

Hawthorns District.

NOTES.—Walker Lake *Bulletin*, Nov. 5: The ten tons of ore shipped by Benj. Curler from his mine beyond Luning, and which was worked in the Franklin arastras above Dayton, yielded $25 a ton. The branch railroad to the Cottonwood camp is completed and the force of workmen discharged. Already several hundred cords of wood have been hauled down. Manager Hooper of the Garfield mines is at the front, where important work is being done. They are working in favorable ground, with good indications for an important strike.

Candelaria District.

GOOD ROCK.—About 200 tons of custom ore have been crushed at the Mount Diablo mill at Sodaville recently, and the average of the rock has been $180 per ton. This mill always gives satisfaction to customers.

STAMPS IDLE.—The stamps are all hung up in Belleville, owing to a cave in the big Stedefelt furnace. The pans in the lower mill are going, and the stamps will be turned loose when the furnace is repaired.

White Pine District.

ABOUT HAMILTON.—*News*, Nov. 8: Ex-Governor Blasdel returned here from Hamilton last week and left for Reno and San Francisco. We learned from him that prospects in that locality are reviving, and there are no idle men there. The revival is mainly due to the low rate charged for the treatment of ore. Very promising new developments and a oumber of strikes of rich ore have beeo made. The base metal range is opening up and arrangements are being made for leaching the ore next spring. Supt. Kendall is getting out 10 tons of ore from the Ward Beecher and Edgar mines to have treated, as an experiment, by the Russell process, at the Marsac mill, Park City, Utah. Should the experiment prove successful, works for treatment of the ore by that process will be put up near Hamilton next spring.

Plochs District

ESTIMATING TONNAGE.—*Record*, Nov. 1: Mr. Henry F. Wild, a practical mining mao of large experience, whose headquarters are at Boise City, Idaho, is among us examining the various mines in this vicinity, more particularly the Pioche Con. Co.'s group. He comes io the interest and at the request of the management of the U. P. R. R. to estimate the probable output of ore with reference to daily shipmeots when the road now in course of construction to this place shall be completed. It is the intention of the U. P. Company to finish the Pioche branch at any rate, but the amount of traffic immediately ahead will determine them whether to push the work with some haste or allow it to lie in its present state an indefinite length of time. Mr. Wild's report goes directly to headquarters, and will have great weight with the directors. The mines of the P. C. Co. all look well, and there is no reason to believe that Mr. Wild's report will he other than favorable.

BRISTOL.—Bristol, but a few years ago bustling with business and for several years past practically deserted, is experiencing a little more life. Jesse Orwin, who has heen chloriding the old furnace dump for the P. C. Co. for the past year, has out about 2000 tons of good slag for shipment. Before shipping here it is calcined and works much better for it. The stone coal-kilns built there by Devine & Co. years ago are in use again by the P. C. Co. Wood is hauled from the surrounding mountains for which the company pays $4.75 per cord delivered at the kilns. It is theo burned in the kilns and the product hauled to town here. W. J. Roe is engaged in hauling from that point oow.

DAY AND ONONOAGO.—Fifteen teams are steadily hauling ore from the Day and Onondago mines. About 20 tons from the Day aod 5 tons from the Onondago are shipped daily. The Onondago is said to be looking much better oow than when the present company purchased it in June last. T. Williams, foreman at the Day, says the mine is opened up in such shape that 125 tons of ore could be extracted daily from the works above the tunnel level, if necessary, without difficulty.

HIGHLAND.—The steam hoist at the Mendha mine, Highland, is completed and was expected to go into operation yesterday. The opening up of this mine will go ahead rapidly when the hoist is fairly at work.

ARIZONA.

THE BAUMAN MINES.—Our agent in Arizona has recently examined the Bauman group of mines in the Agua Fria district, 15 miles east of Prescott. This group consists of ten full mining claims, each one measuring 1500 feet along the vein, by 600 feet in width. They are located upon different ledges of copper, silver, and gold-bearing quartz. The Agua Fria district is named from the adjacent valley with a similar title, which valley is thickly settled by ranchers and cattle-raisers. The mountains (or hills) in which the mines in question are located are a southern spur of the Black Hills. The famous United Verde copper-silver mines are located in these Black Hills. Very good wagon-roads lead to the Agua Fria district, thus making it one of the most accessible mining camps in Northern Arizona. The rock formation in the Bauman mines is identical with that in the other mines of this great mineral belt, which extends from the Bradshaw mountains (30 miles south of Prescott) through Big Bug and Agua Fria districts, and ends in and with the Black Hills. Successful mining is carried on throughout this vast zone, in several instances, on a large scale, especially in the Big Bug and Black Hills districts. The well-known metal-broker firm of Phelps, Dodge & Co. of New York (Prof. Douglass, Pres.) are the principal operators in Big Bug, extensively developing the Hackberry and Boggs mines; and in the Black Hills it is Hon. W. A. Clark of Butte, Montana, who very successfully operates the rich United Verde mines and smelters at Jerome. The Bauman group lies between the two localities just named, and is in the same mineral belt. These mines are only partially developed, but so far as operations have been extended the indications are excellent. The strongest and most important vein in the group can be traced for several miles over mountains and across ravines. Four claims are upon this lode. The ledge measures about 25 feet in width, dips to the east at the rate of six feet in ten, and is inclosed in porphyry walls. Five hundred yards west of this is another ledge upon which there are two locations. Two hundred yards farther westward is a large dyke of quartzite on which is another location. The eighth location is upon another parallel vein one-half mile west of the first-named or mother lode, while the two remaining locations of the group are upon spurs running eastward from the mother lode. Sampling tests of ore taken from the different locations show that the rock carries gold, silver and copper, the former metal running as high as $33.50 per ton, with a small percentage of the two other metals; then again carrying as high as 87 ounces of silver to the ton, $2 in gold, and 17.5 per cent copper; while in other cases 17 ozs. silver per ton will be found, with a trace of gold and 67.2 per cent copper. The foregoing are, to be sure, some of the highest results obtained from the working of any considerable lots of ore, but the lower grade lots which were subjected to the assayer or sampler returned results not at all discouraging. The general average of the tests indicates that there is here a safe if not a highly profitable investment for the miner and capitalist. The Bauman mines have undoubted merit, and offer an excellent opportunity for the employment of some of the capital that is now lying dormant at our centers of wealth.

BLACK ROCK DISTRICT.—This is a new district situated about 60 miles south of Prescott and 10 miles northeast of Wickenburg, in Yavapai county. The best-defined ledges in Arizona are situated in this district. The Slim Jim group, situated at the head of Slim Jim canyon, is rich in gold and copper. The ore body, 6 feet wide in the Slim Jim, averaged $25 in gold and 16 per cent copper. Other ledges of the group, of which there are four, make equally as good a showing. These mines are owned by Ashtoo & Mahoney. The Amazon, a group of ten mines 20 to 60 feet wide, averaging $12 gold and a fair per cent of copper, situated half a mile east of the Slim Jim, are owned by Groom & Wade. The King Solomon, a four-foot vein of $20 free gold ore, owned by the same parties, are a few of the mines of this district. Very little development has been done in the district, the ore being too low grade to ship. By spring many of the mines will be opened in good shape.

ALASKA

TO BE EXPLORED.—*Alaskan*, Oct. 30: A bill providing for the exploration of Alaska has been placed on the calendar of the House of Representatives. The bill, as reported from the Committee on Military Affairs, provides for stationing and maintaining a detail from the army in the heart of that Territory for a sufficient term of years for the purpose of exploring the resources of that section, and appropriates $100,000 for the payment of expenses. Its passage is urged by Western miners, who hold the firm belief that Alaska is rich in mineral wealth, and who wish to use the military establishment as the base of operations.

GOLD PRODUCT.—Lyman E. Knapp, the Governor of Alaska, in his annual report, shows that among the exports during the last year was gold (estimated), $2,000,000; all other exports sufficient to make the total $9,840,730. He states further that considerable activity has been manifested, but no excitement in connection with the various mining interests.

COLORADO.

DEEP MINING IN COLORADO. — *Register-Call*, Nov 6: The deepest mine in Colorado is the New California Mining Co.'s shaft on Quartz hill in this county, which has attained a depth of 2045 feet. Good pay and a strong vein have been encountered in the 2000-foot west level. The manager of the property, Mr. Alfred Rickard, has persistently worked this property, while many others would have closed down. He is now making preparations for sinking an additional 200 feet, which will give a depth of 2245 feet. To Mr. Rickard belongs the credit of demonstrating the fact that deep mining pays in Colorado.

FROM IDAHO SPRINGS. — Denver *Republican*, Nov. 7: The Idaho sampler and concentrator and the Chamberlain & Co. sampler are both busily engaged in treating the ores in this and adjacent camps. The Mixsill stamp mill is proving a source of wealth to the owners. Frank Fitzpatrick is obtaining gold in paying quantities in his placer in East Idaho. The Ohio Gulch Mining Co. is working three men on its mine in Ohio gulch. The Humboldt mill is at work, and doing satisfactorily. The Senator, at the head of Ohio gulch, is at present producing more ore than any of the mines in the Dumont section. The Champion Dirt, on Trail run, is producing its regular quota of gold and silver. This is the property of J. Alden Smith, Ex-State Geologist. The Jo Reynolds still keeps up its wonderful production of rich silver ores. The company employs 65 men at day's pay. Besides these, there are 20 leasers. The shaft is 600 feet below the tunnel level, making 1000 feet in depth from the surface. The ore in the bottom is stronger than above and is of as good grade.

IDAHO.

COEUR D'ALENE MINES.—Wardner *News*, Nov. 1: On Tuesday last two important sales of mining property were consummated at Spokane, consisting of a half interest in the Union mine, near Burke, for $100,000, and a similar interest in the Cleveland, at Gem, for $75,000.

A NEW DISTRICT.—Idaho Co. *Free Press*, Nov. 2: Messrs. Troutman, Kempf and others were out from Elk City during the week and had some magnificent specimens of ore from their quartz mines on Red river. This district is one of great promise, and at the present rate of development it will speedily assume prominence.

NEW MILLS.—Idaho *World*, Nov. 4: The Idaho Gold Mining Company's mill at Bonanza, Custer county, is completed and running. Wm. Libby has had seven and one-half tons of ore from the old Chickahominy ledge crushed in the Forest King mill. The cleanup was made last Wednesday. The gold had not been assayed when we went to press, but it is estimated by auriferous experts that the amount, 150 ounces, is worth about $2000. The ore, therefore, ran over $200 per ton.

SEVEN DEVILS DISTRICT.—Salubria *Citizen*, Nov. 6: Another big deal in the Seven Devils is reported to have been closed the first part of this week, The Copper Key, belonging to Charles Anderson and Al. Donart, was purchased by Boston capitalists for $12,000, There has been in the neighborhood of $2,000,000 worth of property sold in the Seven Devils this season alone, and we are informed that a big deal will soon be closed and made known to the public.

POORMAN.—The Poorman made connections with the air shaft Monday noon. A few days' time in timbering the upraise will finish this work, after which day and night shifts will be put on to drive the main tunnel on toward the north shaft. When this point is reached the mine will be in good shape to work a large force of men. In the meantime, all ore extracted is being stored in the ore-house.

LOWER CALIFORNIA.

ALAMO NOTES.—*Lower Californian*, Oct. 30: Russell & Rhodes are jubilant over the find in the Aurora, where, in a space of 5x7 feet, was extracted in two days over $2000. The brick is a beautiful specimen. They cut through a dyke of porphyry and were rewarded by the discovery of a fine vein wider than that above and much richer, in fact the rock ran by mill test over $300 per ton. The Princesa mine adjoining is also in honanza and the Princesa millrun this month shows the result. The Indio and Ulises are starting up and adding their quota. It is wonderful how the idiotic idea of a princely two-strike in the Ulises gained ground. There was no such thing, though the mine is fairly rich, and there is no telling what is hidden below. The Montezuma mine and mill are booming. New contracts have been let to extract ore from several parts of the mine. The mine is fast coming to the front as one of the best here. It is reported that the El Paso Co. will start up in 10 or 12 days. A lead on the Indio mine has stopped working, but will start up as soon as a pump can be put on. Ben Funk reports that his labor in the Rich gulch placers yields him from $5 to $15 daily. Other placer mines are doing almost as well. The Lizalda silver mine near the boundary line is giving good results and developing into a fine property. Enterprising Mexicans and Americans compose the company that owns it. The mine is thought to be on the same mineral belt as the rich Sueño.

MONTANA.

A CONCENTRATOR NEEDED. — Boulder *Age*, Nov. 5: The large quantities of ore lying on the dumps of the various mines within a radius of from two to five miles of Boulder is good evidence that a concentrator is badly needed here.

THE DODGE MINES.—The White Dog mine in the Bigfoot district is making an exceedingly good showing. A tunnel is being driven along the vein and is now in about 50 feet. The ore body varies from four to seven feet in size and is of excellent quality.

THE CHAMPION MINE.—The *Silver State* is authority for the statement that a shoot of ore surpassing in extent and richness anything ever struck in the mine has been encountered in the Champion in Oro Fino district.

A NEW SMELTER.—Butte *Miner*, Nov. 6: Articles of incorporation of the Helena Mining & Smelting Co. were filed a few days ago with the Secretary of State at Helena. The capital stock of the company is $3,000,000, divided into 300,000 shares of a par value of $10 each.

REORGANIZED.—The Silver Crown Co., operating in Oro Fino district, has been reorganized and is now called the New Silver Crown Mining Co., with 500,000 shares of stock of a par value of $1 per share.

IMPORTANT STRIKE. — *Montana M. Review*, Nov. 5: A very important strike was made in the Boulder Chief mine, located near the Penn Yan and Bluebird properties, in the Cataract country. In a crosscut run from the 250-foot level, five feet of high-grade ore was struck on the hanging-wall. Five assays made from the new strike gave returns as follows: $96.06, $121.76, $62.77, $147.24 and $82.88.

NEW MEXICO.

LORDSBURG.—*Western Liberal*, Nov. 1: Superintendent Catchings of the Humboldt company informs the *Liberal* that Noel May, who recently experted the company's property here, is on his way back from Memphis to erect a leaching plant the material for which has been ordered. The plant is similar to the ones used at Swansea, Wales, the great head center of metallurgy. New life is to be infused into the affairs of the Arizona Copper Co., a Scotch corporation.

FROM VARIOUS CAMPS.—*Western Liberal*, Nov. 7: A portion of the machinery recently purchased by the Standard Mutual Mining Co. has arrived and the balance is expected within the next 30 days. A. Applegate has some beautiful specimens of concentrates made by a new machine which is working at Denver. The machine separates by centrifugal motion and works very fast and close; one of the specimens run about $700 per ton and was concentrated from slag from one of the smelters which was worth about $1 per ton. The machine works very cheaply and bids fair to make a big change in milling operations. A. Applegate, superintendent of the Chilidema Mining Co. arrived home from Kansas City and Denver last Saturday. Mr. Applegate informs the *Liberal* that a milling plant with a capacity of about 100 tons per day, has been ordered. The plant consists of Cornish rolls for crushing with jigs for concentrating. The ore has been successfully tried on the machinery. The jigs save the heavy values successfully. The light values, principally silver, will be saved by slimers. Just what variety of a slimer will be used has not been determined, as the company is waiting the results of certain experiments now being made in Denver. The machinery will all come from Denver, where it is now being manufactured. Mr. Applegate intends to begin immediately to sink a three-compartment shaft as the main working shaft. He will put on three shifts and expects to have it down so that it can be used by the time the machinery is in position, which will be in about 90 days. This will be another large company working in Lordsburg, the mines being about three miles from town, and will add largely to the business of the town.

UTAH.

DENVER CAPITAL IN UTAH.—Salt Lake *Tribune*, Nov. 1: Several prominent Denver capitalists are making arrangements to begin operations in the silver-lead mines in the Tintic district in Utah. Nothing definite has yet been given out, but it is stated the enterprise is to be conducted on a large scale.

TINTIC ITEMS.—A big mining deal was made in Eureka on Thursday last, Hon. W. H. Smith, superintendent of the Bullion-Beck, and J. F. Knapp of the *Tribune* purchasing an extension of the Bullion-Beck property. It lies immediately adjoining the Centennial-Eureka on the west and about 100 feet from the Eureka Hill properties on the south. It is called The Ranger, and is said by all the miners in the district to be one of the best properties in Tintic. A strong miners' union has been organized in this camp, and it is expected that in two weeks the membership will be at least 500. The objects of the union are commendable, being the protection of its members, the bettering of their condition, and the making of arrangements whereby the sick and needy in the Order will be entitled to and receive proper care and attention. The richest ore body in the Centennial-Eureka—that on the 300-foot level—is now 18 feet wide and constantly growing wider. On account of the richness of this ore and of the fact that their storehouses are all full of ore, no more will be shipped until silver advances. The Centennial-Eureka is one of the greatest properties in Utah.

DEEP CREEK COUNTRY.—Messrs. F. W. Wampler and G. D. Shell returned yesterday from the Deep Creek country loaded down with enthusiasm over the situation out there. Fine ore finds are reported in many localities, while at Gold Hill ore is being turned out, assaying, it is said, $1000 gold to the ton. The railroad cannot get out there any too soon. A great traffic awaits it.

WASHINGTON.

THE CASCADE MINERAL RANGE.—Seattle *Press*, Nov. 8: There is no better known mining expert in this section of the country than Prof. Chas. F. Blackburn, whose opinion carries weight in any mining circle. He has been investigating the Cascade region thoroughly, and as the result of his conclusions addresses the *Press* the following communication: "Having spent seven months in the Cascades engaged in prospecting and developing mines, I am prepared to announce that our mineral resources are immense. Millions of dollars are going to be realized from the mines of this grand old range. The mines are here. They are numerous and rich. I have seen large veins of gold, silver, copper, lead and iron right here in King county. The veins are both true fissures and contacts. Some are large and well defined. They contain the metal in good-paying quantities. There is every indication of these ledges being permanent. The formation is slate, granite, porphyry and gneiss, with other crystalline and metamorphic rocks. I am speaking of the Snoqualmie district. In this region there are also some igneous or eruptic materials. The latter is usually in dykes. There are a few extinct volcanic craters. The absence of fossiliferous or sedimentary formations is remarkable. Especially is this so in the range proper. There may be such strata in the coal region along the lowest foothills. Archæan granite exists here in mountain masses. The latter is the oldest rock here found."

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

H. KELLEY—Modoc and Lassen Cos.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 4, 1890.

439,992.—TREADLE PUMP — W. H. Anderson, Riverside, Cal.

439,832.—OPERATING KEYS OF GAS CHANDELIERS—R. F. Bridewell, S. F.

440,003.—WRENCH — W. S. Bunch, Marshfield, Ogn.

439,741.—WIRE SUSPENSION BRIDGE — H. C. Carmack, East Portland, Ogn.

439,812.—MINING—J. W. Crites, S. F.

439,933.—DITCHER AND CULTIVATOR — O. T. Davies, Brighton, Cal.

439,744.—DUST PAN ATTACHMENT — Dean & Earle, S. F.

439,815.—BARREL STAND—H. H. Fisk, Florence, Ogn.

439,649.—CIGAR HOLDER—A. Fritschi, Suisun, Cal.

439,940.—OPERATING ELEVATOR GATES — W. H. Golder, Portland, Ogn.

439,941.—STATION INDICATOR —L. Goldstone, S. F.

439,820.—MACHINE FOR MAKING SHELLS—Chas. D. Kennedy, California City, Cal.

439,959.—TELEGRAPH KEY—W. A. J. Kohrn, S. F.

440,047.—HARROW—H. L. Mack, Ellensburg, Wash.

439,966.—YARN-DYEING APPARATUS—W. Maybury, Pasadena, Cal.

439,823.—OPERATING SHUTTERS FOR ELEVATOR SHAFTS—Ranlet & Provost, S. F.

439,687.—WASH-BASIN DISCHARGE — J. W. Reid, S. F.

439,897.—CAR COUPLING—P. W. Ross, Los Angeles, Cal.

439,902.—HOSE COUPLING—F. E. Sharon, S. F.

439,982.—CAR COUPLING—J. L. Stillman, Fresno, Cal.

439,929.—RUBBER SHOE — John Taggart, San Diego, Cal.

439,755.—WINE-SCHOONER—L. Wagner, S. F.

439,989.—CHAIR ATTACHMENT—A. M. Whiteley, Sacramento, Cal.

439,917.—WATER BACK FOR GAS STOVES—W. H. Wiester, S. F.

The following brief list by telegraph for Nov. 11, will appear more complete on receipt of mail advices:

California—Louis Benussi and K. and C. Dondero, S. F., preservative; William C. Dillingham, Los Angeles, combined job and news galley; William Fay, Oakland, carpet-cleaning machine; William H. Ounsolus, Sutter Creek, water-wheel; Silas Harris, S. F., upsetting machine; Byron Jackson, S. F., centrifugal pump; Willie C. Keithly (assignor of one-half to J. Farnham), S. F., adjustable picture-frame hanger; Ellsworth D. Middlekauff and C. D. Harsin, Stockton, gate; William W. Sherman, S. F., self closing gas-burner; Henry Thihault, S. F. sickle-grinder.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR CUTTING BOARDS.—James Birney Burrell, Wrights, Cal. No. 439,321. Dated Oct. 28, 1890. This machine is intended for cutting wood into slabs or boards, and more particularly for cutting boards from logs. It consists of a fixed guide rail, a carrier mounted and adapted to be reciprocated thereon, a bit or knife mounted on the carrier and a means for feeding the bit or knife at each stroke, consisting of a nut on top of the vertically movable plate which carries the bit or knife, a screw seated in the nut, a ratchet-wheel on the screw and racks at each end of the machine for engaging the ratchet-wheel. It also consists in the novel double-ended knife or bit having planing points at each end and intermediate scoring edges which extend below the horizontal plane of the points, so that they will score the wood on the previous movement of the knife before the planing points cut the shaving out. It also consists in novel adjustable dogs for holding the log.

MACHINE FOR MAKING SHELLS.—Charles D. Kennedy, California City, Cal. No. 439,820. Dated Nov. 4, 1890. This machine is adapted for making paper shells especially. These shells form the receptacles in which powder is packed. In operation, the machine rolls the paper into cylindrical form, twists one end to form the shell bottom and then removes and discharges the completed shell. The essential parts of the machine are a rotating hollow former about which the paper is wound into a cylinder, a twister at one end which seizes and twists the end of the cylinder to form a bottom, a sliding push-rod operating within the hollow former and against the inner side of the shell bottom, and a sliding push-bar which presses against the outer side of the bottom whereby the shell is held between the two and thus slid off the former.

DEVICE FOR OPERATING KEYS OF GAS CHANDELIERS.—Richard F. Bridewell, S. F., Cal., assignor to David McKay, E. F. Badgely and Mary B. Bridewell, all of same place. No. 439,832. Dated Nov. 4, 1890. This device is especially intended for chandeliers having electric lighters and extinguishers. Its object is to provide simple and effective means for lighting the gas of the whole chandelier by a single movement and at once. It consists of a central turning key, slide-rods connected therewith and operated thereby, and connections between the outer ends of the rods and the burner keys, whereby said keys are all simultaneously operated by the movement of the central turning key.

MECHANICAL PROGRESS

HOW METAL WARES ARE COLORED.—Small metallic articles, buttons, clasps, buckles and others, have different colored films produced on them by various methods. Some of these are known as oxidized silver. Rainbow colors are produced on brass buttons by stringing them on a copper wire and dipping them in a bath of plumbate of soda, freshly prepared by boiling litharge in caustic soda, and pouring it into a porcelain dish. A linen bag of finely pulverized litharge or hydrated oxide of lead is suspended in the solution, so as to keep up the original strength of the solution. While the buttons are in solution, they are touched one after the other with a platinum wire connected with the positive pole of a battery, until the desired color appears. The galvanic current employed must not be too strong. The colors are more brilliant if they are heated after they have been rinsed and dried. Colored films are more conveniently produced upon bright brass by different chemicals, by painting with them, or by immersion. For example: Golden yellow.—By dipping in a perfectly neutral solution of acetate of copper. Dull grayish green.—Repeatedly painting with very dilute solution of chloride of copper. Purple.—Heating them hot and rubbing over with a tuft of cotton saturated with chloride of antimony. Golden red.—A paste of four parts of prepared chalk and mosaic gold. In covering an article with any colored bronze in powder, it is first rubbed with a very little linseed oil, and the bronze is dusted evenly over it from a dust bag. It is afterward heated in an iron pan to about 480 degrees Fahr. In recent times, small articles are also roughened by dipping in strong nitric acid, and, after washing and drying, they are coated with a rapidly drying alcohol varnish that has been colored yellow with picric acid, red with fuchsine, purple with methyl, violet or dark-blue with an aniline blue. This gives the desired color with a beautiful metallic luster. These colors are not very durable and are for inferior goods.—*Ex.*

LACK OF APPRECIATION BY EMPLOYERS.—The lack of a proper degree of appreciation on the part of an employer is not only an injustice to faithful and interested workmen, but is an injury to himself as well. It costs nothing, but is a good investment, even at the price of an occasional reward, and is the least that might be expected when it is deserved. An exchange says: "A skilled mechanic who has worked out and perfected several devices for turning out an increased amount of superior quality of work, and who has presented said devices to his employer, recently remarked to the writer: 'I have lost all interest in advancing the work of this shop; my sole ambition is to put in ten hours per day and draw my pay Saturday night. I am all done with the idea of trying to advance the interests of my employer by brain labor on improved methods of doing work. The firm has several devices which save it many hundred dollars per year. I have received several kicks but no thanks in connection with these matters; therefore I am done.'" As before stated, this mechanic is a good workman, an intelligent man and a practical inventor. He was driven to the course described by the lack of appreciation on the part of his employer. Such a course does not pay. If a man interests himself in your business sufficiently to give his time and brains to further the work, at least appreciate the man's efforts, and make him feel that you are under obligation to him, even if he receives no pecuniary benefit. The man who is capable of devising a labor-saving operation or appliance may bring forth many more of the same kind if he is given encouragement. An employer should care at least enough for his own interests to give the workman all the appreciation which he deserves.

AMERICAN RAZORS BECOMING POPULAR.—There is generally much prejudice among Europeans, both at home and in this country, against American razors; but this feeling is gradually wearing away both here and abroad. Many hardware articles of American manufacture are now accepted in Europe in preference to home manufactures. In this country the best razors and knives no longer come from Sheffield. Even Englishmen, says the St. Louis *Globe-Democrat*, are alive to this fact. "The best customers for American razors are of English and German descent, as very few Germans or Irishmen act as their own barbers. Formerly, nothing without a genuine or fraudulent Sheffield trademark cut into the blade would be looked at by an ex-subject of Queen Victoria, but now American goods are generally preferred, and some Eastern makes are very popular. The greatest run the last two years has been on a razor with a distinctive military name, and, although I have sold a great many of the kind, I don't know where they are made. But the fact is immaterial, for no purchaser ever finds fault with anything connected with one in any respect save price, and even that is not seriously objected to."

NEW TEXTILE MACHINERY.—Quite an interest, it is said, is exhibited abroad in a machine recently brought forward for effecting successively all the four processes of treating textile fibers, such as flax, hemp, etc. The flattening process is accomplished by means of the combined action of a single feed roller and a large central fluted cylinder, the feed roller being also fluted, the flutes being so arranged as to meet those of the central cylinder, without gearing between them; in some cases, as in the decortication of ramie in the dry state, the feed roller may be provided with spiral flutings, instead of the ordinary plain pattern. After having been straightened, the fibers are passed between a series of fluted rollers and the central cylinder, in order that their woody parts may be broken, the flutes of the small and large rollers working between each other. At the conclusion of this process, the fibers are passed directly downward between two pairs of scutching drums driven at high speed; the interlap of the blades of the drum is adjustable, increased or diminished according to the tenacity of the material. When the fibers are in a green state a jet of water falls upon them while they are passing between the scutchers, or, as in the case of long hemp fibers, endless aprons are employed, having a series of combing teeth. For the driving mechanism, a driving pulley and large spur-wheel are attached to each other; and mounted to run loose upon the axle of one of the scutching drums, the spur-wheel gearing into pinions upon the other shafts.

ALUMINUM FOR IMPROVING STEEL.—Some difference of opinion seems to exist as to the value of aluminum for improving the quality of steel; but Sir Frederick Abel, in describing the experiments in this direction recently made by several well-known gentlemen, says: "The influence of aluminum, when used in small proportion, upon the properties of gray and white cast iron, is of considerable interest, especially its effect in promoting the production of sound castings, and in modifying the character of white iron in a similar manner to silicon, causing the carbon to be separated in the graphitic form. The probable beneficial connection of aluminum with the industries of iron and steel naturally directs attention to the great practical importance, in the same direction, which has lately been acquired by certain other metals, which, for long periods succeeding their discovery, have either been only of purely scientific interest and importance, or have acquired practical value in regard to their positions in a few directions quite unconnected with metallurgy. Thus, great interest attaches to the influence of the metals manganese, chromium and tungsten upon the physical properties of steel and iron."

AMERICAN STEEL IN EUROPE.—A gentleman who represents a firm of Pittsburg manufacturers of fine steel, has gone to Europe to arrange for the shipment and sale of this material to European consumers. The house in question established a branch in London some two years ago, and has been selling more or less of its products in Europe ever since. This agent will locate other agents in the leading trade towns in Great Britain and on the continent. An agency will be opened at Paris, and probably one at Hamburg. The *Dispatch* argues that although it may cost $10 a ton to ship fine steel to London, its quality will be such as to assure its sale in competition with the home product. It is chiefly owing to the superior quality of the steel from which American chisels, axes, knives, planes and other edge tools are made, that they command the preference in Australia, New Zealand and South America, at comparatively high prices, over the like manufactures of England and Germany.

STEEL CAR-WHEELS.—The following test of steel car-wheels, made by the American Steel Car-Wheel Co., took place recently at Boston, in the presence of several prominent railway superintendents: A 33-inch car-wheel was placed on two solid iron blocks, rim resting on each block. A weight of 525 pounds, falling at a hight of 17 feet, struck the hub 25 times without any effect except battering the metal. It was then dropped 10 times on the rim without a fracture. Then a weight of 1400 pounds was tried, falling at a hight of 17 feet, struck the wheel 11 times, but failed to break it, showing it to be practically indestructible. At another exhibit, in order to test the expansion and contraction of the metal, a wheel was buried in sand and a charcoal fire built around the tread until it was brought to a red heat. Then it was taken out and exposed to the atmosphere, which had no effect on it whatever. This demonstrates that the wheel is a safe one. These wheels are in extensive service.

THE GIFFARD GUN.—It is reported that Colt's Armory at Hartford has secured the American rights for the Giffard gun, recently described in these columns, in which the magazine consists of a strong steel tube filled with carbonic acid gas, liquefied by pressure. When the arm is fired, the mechanism admits a drop of this liquid to the barrel behind the bullet, and the expansive force drives it out at a speed exceeding that attained by the use of powder, and with several other advantages of its own. It is said that $1,000,000 was paid for the American rights to the gun.

THE CAR WORKS all over the country have advanced the prices of building passenger coaches. A coach which was built a year ago for $5200, the works will not build now for less than $5500, and the car works are steadily advancing the price of box and coal cars.

THE JERUSALEM-JAFFA RAILWAY has just been equipped with three locomotives made at the Baldwin Works in Philadelphia. They arrived at Jaffa on Sept. 22d. Thus the first locomotives used in this ancient land are made in the New World.

SCIENTIFIC PROGRESS.

Mind and Matter in Science.

In whatever department of thought we find it occupied, science is hostile to uncertainty. All that is fully accepted must be capable of proof, and anything that cannot be thus verified is not accepted as science. Of course, most things have reached the acceptable, as science, through conjectures, doubts and the most careful efforts at verification. Such is the road over which most that is now recognized as science has traveled.

The beginnings of science have their mutable facts, tentative theories and conditional or provisional acceptances. Modes of thought, charitable consideration and time for conclusions must be allowed, or there would be no progress in science. The true searcher after truth—the earnest science-builder — should give reasonable consideration to all propositions, however crude or apparently unphilosophical. It is only by such a method that propositions can be planned, arranged, recast and slowly matured until they can be either cast aside as worthless or safely accepted as progress in science.

"Science and philosophy," says a writer in the London *Lancet*, "it must be remembered, are not contraries. They are merely the obverse and the converse of the same intellectual process, the former objective, the latter subjective as to its rational method. Either may, in the wider acceptation of its meaning, be taken to include the other, and it is only the prominence of one, the physical application of scientific study, which has associated the former with what we call matter, as distinct from spirit or mind, the natural sphere of the latter. However diverse they may seem to be, distinction between mind and matter is, in the present state of our knowledge, impossible. We are as yet without experience or information respecting the separate condition of one or another. At all points matter is instinct with incorporated properties which constitute the law of its being, though whence derived its atoms cannot tell us; and mind, on the other hand, can only confess itself through its physical manifestations. Though we should penetrate, if it were possible, beyond the earliest known traces of our world, we might still be as far as ever from a solution of the mystery, but at no stage could we expect to pass beyond the age at which these two became united. Everywhere we still find, whether in vital activity or in the buried vestiges of world-old existence, the sure signs of cause and effect. The design may vary, but its evidences are never wanting.

"Some, perhaps, may prefer to regard it as the essential possession of matter, and to dignify this with the attributes of a creator. We cannot but think, however, that the very diversity of material forms, and their infinite variation in conformity with some discoverable purpose in each case, mark them out rather as the vehicles of some compelling force implanted in them. That this force is not purposive but fortuitous in its action is incredible. Given a certain stage in the progress of development, circumstance may, indeed, accomplish many modifications, as the laborious genius of Darwin has abundantly proved; but even these are governed by strict limitations, are apt to be transient in character, and are rather differences of degree than alterations in type. The argument for intelligent design is not seriously impaired, in our opinion, by such evidence of a merely material agency, and there is every reason to believe that this view is yearly gaining ground among the more scrupulous thinkers in physical science. It is significant to find an authority like Prof. Tyndall, despite his belief in matter and force as primary factors in the production of life, admitting the probable existence of a 'power of creation,' which he associates with evolution, and proposes to invest with some feeling akin to worship. Prof. Huxley's condemnation of materialism as 'the most baseless of dogmas' is also—at least constructively—suggestive of a disposition to include within the beliefs of natural science the existence of a supreme directing intelligence."

EELS IN VINEGAR.—Dr. G. Lindner discusses the occurrence of the "eele" in weak or impure vinegar. The worms move actively in a fluid medium, creep slowly in thick concoctions, or coil together in complicated knots. They thrive well on a diet of egg, withstand even tolerably strong vinegar, are killed at once by pure acetic acid, are very slightly perturbed by artificial digestive cultures, live well on fruits, bulbs, etc. The females reproduce viviparously or oviparously, according to the nutritive medium and the temperature, but soon die after reproduction, nor are the males long-lived. They flourish best between 60° and 80° F., are killed by a temperature over 107° F., or under the freezing point; on light and air they are very slightly dependent, but to drouth very sensitive. After desiccation for three or four hours, no revivification even of the eggs was observed. The worms have great powers of adaptation to the most diverse conditions. Their natural home seems to be in moist mud and in putridity, but they are rare in drinking or running water. That millions of germs float in the air is a fable. How they get into the vinegar is uncertain, but they probably insinuate themselves at certain stages of its manufacture. In vinegar prepared from wine by the quick process they are very rare. The "vinegar eels" are not exactly dangerous, but it is at once safe and more appetizing to make sure either that the vinegar is of the better sort, or at least boiled and filtered.—*The Microscope.*

SILVER IN VOLCANIC ASHES.—The existence of silver in volcanic ashes is of rare occurrence. Only in two cases have argentiferous ashes been met with. The first sample was obtained during an eruption of Cotopaxi in July, 1885, in the ashes of which Mr. J. W. Mallet proved the existence of one part of silver in 83,000 parts of ashes. In the following year the same investigator was able to add a second instance. In January, 1886, a violent eruption of Tungnragua, in the Andes of Ecuador, between 50 and 55 miles from Cotopaxi, took place, the eruption continuing at longer or shorter intervals up to November of the same year. The ashes thrown up by this volcano, which had been at rest for over a century, contained silver to the extent of one part in 107,200 parts of ashes. This appears, at first sight, to be only a very small percentage of the metal; but when it is considered what enormous quantities of ashes are erupted, and what a vast extent of area they cover after an eruption, the quantity of the silver thrown up with them must be considerable.

AN AID TO GEOLOGICAL EXPLORATIONS.—The Paris *Genie Civil* describes an instrument called the erygmatoscope, designed by M. G. Trouve, for the examination of geological strata pierced by deep boring. The apparatus consists simply of a powerful electric incandescent lamp, inclosed in a cylindrical case, one of whose curved sides serves as a reflector, and the other, made of thick glass, permits the illumination of the bore hole. An elliptical mirror, set at an inclination of 45° in the bottom of the case, throws its images vertically upward through the open top of the case to the observer, who examines them with a powerful telescope. It is said that the apparatus works satisfactorily to a depth of 1000 feet, and that the Portuguese Government has supplied it to its expedition that is exploring the shores of Mozambique.

A PREHISTORIC CITY.—An interesting bit of news comes from Mineral Bluffs, in the copper region of Polk county, Tennessee, announcing that laborers have unearthed a prehistoric city in that vicinity. The first discovery was that of an ancient stone wall, which the workmen traced for one mile. Remnants of dwellings and pottery were also found. An extensive mining operator, from the scene of the discovery, and who has visited the buried cities of Arizona, recognizes parallel characteristics revealed in Tennessee. The work of excavation will be continued. The improvements and industries of the age are uncovering many hidden secrets of the ancients. Even in North Chicago, last week, numerous relics of Indian manners and customs were unearthed.

MARVELS OF MECHANICAL SKILL.—Among the marvels of human skill and ingenuity exhibited by the London Mechanical and Scientific Society may be mentioned an instrument loaned by the great Armstrong Gun Works, which accurately measures thicknesses down to the one-thousandth of an inch; a similar instrument by a rival mechanic which grades thicknesses one millionth parts; a scale by Oertling, the world-famous balance-maker, which turns with the one-thousandth of a grain while loaded with 3000 grains; and an engine by a Paddington watchmaker which contains 122 pieces, not including 32 bolts and screws, and can be hidden in a lady's No. 7 thimble.

VARIATIONS OF THE MAGNETIC NEEDLE.—Camille Flammarion, in a recent letter, says: Monreanx has just determined the condition of magneticism at the Observatory of Juvisy. He has found noticeably that the declination of the magnetic needle to the west is 15° 58'. This value surpasses that of Paris, and therein we find an unexpected discovery. The geological formation of the land does not explain this anomaly. The fact of the existence of this anomaly tends to show us that the distribution of the terrestrial magnetic curves is not nearly so simple as has been imagined up to now.

MAPLE SUGAR OF INDIAN ORIGIN.—According to Prof. Mason, relics of Indian sugar troughs and various other implements of undoubted use in obtaining sugar from the sap of the maple tree have been found. The professor also says that the Indians tapped the silver maple and ash-leafed maple as well as the common maple-sugar tree. Sugar not only entered into the food of the Indians in localities where these trees were found, but many curious customs and religious ceremonies were associated with the annual gathering of sap and production of sugar.

PHOSPHO-BORIC GLASS FOR MICROSCOPES is a new kind of optical glass, which contains phosphoric acid and boracic acid, and is designed especially for the construction of object glasses. The *Photographic News* says it is asserted that by means of this new glass, lately produced in Germany, an object possessing no more than the one-eight-hundred-and-twentieth part of a millimeter can be distinctly recognized.

A LUMINOUS BUOY has been devised, the light for which is produced by phosphuret of calcium, and is visible 2½ miles away.

ENGINEERING NOTES.

Possibilities in Shipbuilding.

Sir Nathaniel Barnaby, Chief Constructor of the British Navy, in speaking of the possibilities in naval construction, says he was recently in consultation with a business man, well known on both sides of the Atlantic, in regard to the practicability of building and sailing, at profit, a steamship, 1000 feet long and 300 feet wide, with a displacement of 100,000 tons. The size of such a monster ship may be better conceived by a comparison with the Great Eastern, whose displacement was only 24,000 tons—less than one-fourth that of the one now proposed.

The ship is to be built of steel. Its size would be so great that it would neither roll, heave nor pitch in the roughest sea; it would only be subjected to a gentle undulation. The ship in fact would be a floating island. The engines would be of 60,000-horse power, and its speed 15 miles an hour.

Two difficulties would have to be overcome: Such a ship could not be launched, and would consequently have to be constructed afloat; although the ship might be so constructed as to draw only 26 feet of water, still she would be incapable of entering any dock, or of being placed alongside of any wharf to take in or discharge cargo. There would be no serious engineering difficulty in overcoming the first obstacle; to avoid the second, Mr. Barnaby proposed the following novel expedient.

He says: "I propose to form shallow, still water harbors or docks within the ship, entered by gates in the sides, and to carry, always afloat there, the loaded barges and tugs; turning the barges out and taking in fresh ones already loaded at the ports of discharge and shipment. Such a ship would require to be fortified and garrisoned like a town. She could be made absolutely secure against fatal injury arising from perforation. The subdivisions required for this purpose might be made to serve effectually against the spread of any local fire. I do firmly believe that we shall get the mastery over the seas, and shall live far more happily in a marine residence capable of steaming 15 knots an hour than we can ever live in seaside towns. The question whether we shall effect our conquest by mere size, or by mechanical devices, in ships of more modern proportions, depends upon the success of certain efforts which are now in progress in another direction."

F. M. Barber of the United States Navy is reported as commenting on this proposition as follows: This is to me a very curious and interesting discussion because it is all feasible; every bit of it feasible; only I think that if the Great Eastern with 24,000 tons displacement was no good, this vessel, with over 100,000 tons displacement, would be equally no good if she did not have speed.

The Present and Possible Speed of Ocean Steamships.

Undoubtedly, says the *Steamship* (John Lockie, Leith, Scotland), we are rapidly approaching limit of the speed for ocean-going steamers built with the materials which are available at the present time. Assuming the average Atlantic passage of the crack steamers to be six days, it will be interesting to consider what would be required to reduce the passage to five days. The present steamers crossing the Atlantic in six days have a mean speed of 20 knots per hour, with a displacement of 10,000 tons and nearly 20,000-horse power. To accomplish the voyage in five days, the speed would have to be 24 knots per hour, or an increase of 20 per cent. Applying Froude's law, we find that the steamer to accomplish the Atlantic passage in five days would require to have a displacement of 30 000 tons and have engines working up to 65,000 indicated horse-power, which would exceed the Great Eastern's dimensions. The strongest available material that we have for shipbuilding and marine engineering at the present time is steel, and with it a limit is soon reached at which the structure will fall to pieces with its own weight alone.

We have had several striking illustrations of this recently in the case of heavy artillery, which show with guns at least the limit of size and strength has almost, if not quite, been reached. The nearer the limit is approached, the greater will be the liability to failure, and consequently the greater the necessity for careful and scientific knowledge being brought to bear on the proportions and design. The only hope of a great stride being made in the increase of speed lies in the adoption of some lighter and stronger material, and so far as we know at present, there is only one metal possible, and that is aluminum. It is quite within the range of probability that at some future time a cheap process of manufacture may bring into practical use this abundant metal.

A FIVE-MASTED SHIP.—The new steel ship France, built at Partrick, Scotland, and the only five-masted ship ever built in the world with the exception of the Great Eastern, was launched a few days ago for French owners. She registered 3750 net tons, and is intended for the nitrate trade on the west coast of South America.

THE FASTEST SEA BOATS NOW AFLOAT.—The French sea-going torpedo boat Coureur is credited in *Lloyd's Register* with a maximum speed of 26.2 knots an hour. The torpedo boat Adler, constructed in Germany for the Russian Black sea fleet, is described by the Russian papers as the fastest war vessel afloat, having attained during its trial trip a speed of 26 55 knots. Three gunboats, one of which is finished, are being constructed in German shipyards for the Baltic fleet, which will be almost as fast as the Adler.

GOOD HEALTH.

WASHING OUT THE STOMACH.—During the past year, says an exchange, several physicians in New York have tried, with gratifying success, a novel treatment for dyspepsia and cancer of the stomach by washing out that organ. The process is very simple and not dangerous. A long flexible pipe is passed down the throat until one end is in the stomach. The upper end has a funnel attached, into which hot water is poured until the stomach is filled. The weight of the water in the pipe and funnel gives a hydraulic pressure sufficient to distend the stomach. The pipe has an aperture big enough to hold a lead pencil. After the stomach has been filled, the funnel end of the pipe is turned down until it is lower than the bottom of the stomach, and the stomach is emptied as a barrel of any fluid is emptied through a siphon. The process may be repeated several times. The result is that the undigested food and mucus are washed out, and the hot water closes the blood-vessels and reduces inflammation. The relief is immediate. The dyspeptic may have his stomach washed out before a meal, so that he can take a fresh start. After the lapse of a sufficient time for ordinary digestion, the stomach may be washed out again. This process has been in use at the New York hospital for some time. The stomach pump has been mainly used in cases of poisoning, and is considered to be the first essential before administering antidotes, but they are so seldom used that few physicians have them. Recently, in a case of poisoning, three prominent physicians were applied to for the use of a stomach pump, and neither of them had one, and the patient had to be taken to the hospital.

WATER AND SALT.—Salt is an absolute essential to the diet of man, says a physician in the Boston *Herald*. It promotes health in various ways. Many of the functions of the body go on better under its influence, and without it the blood becomes impoverished. While a complete privation of salt would produce disastrous results, an excessive use of it would be scarcely less harmful. In large doses it acts as an emetic; in quantities beyond the requirements of health it irritates and sometimes purges. Those who use salt unusually free almost always suffer more or less from constipation. To drink large quantities of water daily should be the rule with those who suffer from constipation. Every day the system needs at least two quarts water, as about that quantity is used up or thrown out of it every 24 hours. Fruits and vegetable food contain much water, and in tea, coffee, soups, etc., considerable is taken habitually. In all ways as stated, about two quarts of water should enter the stomach daily. It is a good plan to drink one or two glasses of water from half an hour to an hour before eating breakfast; and it may be either hot or cold, as preferred. Whichever is used, the water should be slowly sipped. To delude the stomach with cold water would be to invite dyspeptic troubles.

TO AVOID DIPHTHERIA.—A correspondent writes from Cincinnati that diphtheria may be prevented in the following manner: "On a greater or less sensation of pain in the throat, which often occurs from severe or even slight colds after the individual has been exposed to drafts from open doors or windows, take a small quantity of clean cotton and pack it well into the ears, so as to prevent the passage of air to the glands. It will instantly give relief, and nature will do the rest. By putting your fingers in your ears for a moment you may readily convince yourself of what the cotton will do if kept in place for any considerable time."

PRECAUTIONS AGAINST CONSUMPTION.—In a circular on precautions against consumption, published by the State Board of Health of Pennsylvania, the following advice is given: "The duster, and especially that potent distributer of germs, the feather duster, should never be used in a room habitually occupied by a consumptive. The floor, woodwork, and furniture should be wiped with a damp cloth. The patient's clothing should be kept by itself, and thoroughly boiled when washed. It need hardly be said that the room should be ventilated as thoroughly as is consistent with the maintenance of a proper temperature."

HYDROPHOBIA TREATMENT IN NEW YORK.—Since the New York Pasteur Institute opened in February last, 660 persons bitten by dogs or cats have applied for treatment. In 480 cases it was demonstrated that the animals were not mad, and in 130 cases anti-hydrophobic treatment was applied, and all these patients are now in good health. Twenty-one States are represented by patients, one coming from Arizona.

PASTEUR IN RUSSIA.—The Russian Government has made an appropriation of 1500 roubles annually for the maintenance of a Pasteur Institute in Tiflis for the cure of hydrophobia.

USEFUL INFORMATION.

CAN WE MANUFACTURE FINE LINEN GOODS? It is said the effort to manufacture linen from home-raised flax in Minnesota is taking form, work having been begun on the factory at Minneapolis. This experiment will be watched with a good deal of interest, as it is proposed to make a textile product of much finer quality than this country has yet produced. The company has a capital of $500,000. The manager has gone to Ireland to procure the requisite machinery and experienced workmen. The success of the enterprise is devoutly to be wished as the solution of an important problem. Another large mill is proposed by the Eau Claire Linen Company, and several large scutching mills, to prepare the raw material, have been started on the American side of the Canadian border line. Other similar projects are spoken of.

A SUBSTITUTE FOR TOBACCO.—Many different vegetable substances used as stimulating beverages in widely distant parts of the world have been shown to contain caffeine as their active principle. Only one substitute for tobacco has, however, as yet been discovered. This is the leaves of the *Dubosia hopwoodii*, a shrub growing in Australia, the leaves of which are chewed by the blacks in the same way and for the same purpose as tobacco is chewed. The leaves contain an alkaloid, piturine, which is said by certain chemists to be identical with nicotine, but more probably is only closely allied to it. Messrs. Langley and Dickinson have recently shown that the actions of nicotine and piturine are in every respect identical. —*British Medical Journal*

THE BOSTON FRANKLIN FUND IN DANGER.—In his will, Benjamin Franklin bequeathed $4000 to the cities of Boston and Philadelphia, to be loaned at 5 per cent to young mechanics. At the end of 100 years the cities were to divide the amount, which was figured to be $665,000 for each trust fund. The 100 years have expired, and Franklin's heirs have commenced suit to recover the money, alleging mismanagement on the part of the cities, Boston's fund having reached only $400,000 and Philadelphia's fund only $100,000.

SALT AS A PRESERVATIVE.—A correspondent of the *Scientific American* writes to that journal as follows: "Thirty-four years since, I set four 4½ by 4½ inch oak hitching-posts near my residence, 3½ feet deep in the earth, having first bored one 1-inch hole into same some 3 inches above, and another hole of like size some 4 inches below the earth's surface, and partly filling each hole with salt, and then plugging same with a dry oak plug. The posts are today sound and strong. Draw your own inference."

A HUGE BLAST.—No less than 22,000 pounds of powder were used in a successful blast recently at Port Crescent, on Puget Sound, in the State of Washington, for the purpose of displacing about 65,000 tons of rock, or 320,000 cubic yards of rock in a bluff that juts out at the western side of the harbor at that place. It was fired by electricity and the result was entirely satisfactory.

WOODEN FLOUR.—Wooden pulp, which is prepared to be mixed with rags in the manufacture of white paper, is said to be largely used in the manufacture of flour which is ordered by contractors for furnishing Indian rations, and not a little of the same material is said to enter into the cheap bread sold to the poor in the Italian and Hebrew districts of New York.

A LARGE OSTRICH FARM.—In Northern South Australia, ostrich farming is now firmly established. Malcolm's Ostrich Co. has a thriving farm near Port Augusta, with some 7000 acres of rather dry country, the flock numbering 715, the increase being 200 during the last year, and returning over $5500 for feathers.

ALL THE SAME EITHER WAY.—The Bath, Maine, *Times* says that Dr. John C. Berry, who is in Asia on a vacation, mailed a letter and a postal-card to Dr. R. D. Bibber of Bath on the same day, sending one westward via St. Petersburg, and the other east via San Francisco. The letter and card reached Bath in the same mail.

MICROSCOPICAL SCREWS.—It is stated that a lady's thimble of the ordinary size, No. 7, will hold 1,000,000 of the smaller little brass screws used in the manufacture of fine small watches. These screws are so small that to the naked eye they look like specks of brass, and it requires a magnifying glass to show their real character.

TO GET RID OF THE SPARROWS.—It is stated that cornmeal mixed with strong brine or moistened with salt, dried, exposed in the ravenous appetite of the sparrows, is as sure as electricity, therefore not a cruelty to animals.

AN "INCH OF RAIN" means a gallon of water spread over a surface of nearly two square feet, or a fall of about 200 tons to an acre of ground.

DARWIN defines the wag of a dog's tail as "an escape of nervous force restrained for the moment from other modes of expression."

AN ALLOY OF ALUMINUM AND TIN.—According to the *Bulletin International de l'Electricite*, M. Bourbouze is manufacturing an alloy consisting of 100 parts of aluminum and 10 parts of tin, which is said to possess all or most of the advantages of pure aluminum.

ELECTRICITY.

ACCIDENTS FROM ELECTRIC WIRES.—It is quite noticeable that although the business of electric lighting and the use of wires for conducting power is growing rapidly in every direction, accidents of all kinds are much more infrequent. The dangers of electricity have been altogether overrated. There is really no more danger from that source than from gas, when people become educated as to the nature and liability of danger, and learn to act with caution. The more proper placing and insulation of wires has also, no doubt, much to do with the growing immunity from danger. Captain Brophy, inspector of the Electrical Insurance Company of Boston, recently read a paper in reference to this matter in which he said: "The electric light, the electric motor and the electric car have come to stay. Like all other great inventions, they have their faults and they are not free from danger. What form of energy is? Like the steam railroad, the steamboat, illuminating gas and many other great improvements, they have met with stubborn resistance; but in time this will all cease. When railroad trains leave the rails and crush the human form into a shapeless mass, the public do not ask for the abolition of such roads. When swinging gas-jets start a conflagration, or when some unsophisticated person blows out the gas and lies down and passes into eternity, no one demands the abolition of gas works. Why, then, should an unreasonable outcry be raised against the electric light and power industry when this subtile fluid leaves the path chosen for it and causes accidents to persons and property? From my own observations and an intimate knowledge of the difficulties that it was necessary to overcome, I am astonished at the small number of accidents that have occurred since the introduction of high potential currents."

A NEW ELECTRIC CAR STARTER.—One of the greatest difficulties which has assailed the electrical engineer in designing apparatus for electric street-car service is the requirement of an excessive amount of power to start the car from rest. Almost all the cars in service to-day are fitted with evidently far too much power to keep a car in motion at any speed up to 12 or 15 miles an hour. This extra power is necessary solely to start the car from rest, and any device which will obviate this difficulty is worthy of serious consideration, and will be welcomed by all the street railway men. Mr. John H. Palmer has recently brought to Boston a working model of a device which bids fair to prove an unqualified success, and whose principle consists in having a variable leverage mechanism, obtained by involute wheels, by which an enormously increased leverage is attained on the driving-wheels at the moment of starting the car, and for some time after. After getting the car fairly set in motion this mechanism is automatically cut out, and the motor continues to drive the car in the ordinary manner, another clutch automatically gearing into the driving shaft an instant before the starting mechanism is cut out. The model works most accurately and exhibits some very pretty mechanical devices. Experts who have seen it are agreed that the whole device has been most carefully worked out, and will undoubtedly do all that is claimed for it when put in actual operation. The motor can either be kept running all the time or stopped with every stop of the car, if as desired.—*Electrical Engineer.*

ELECTRICITY IN MEDICAL PRACTICE.—A number of Philadelphia physicians and surgeons have formed themselves into an organization called the Electro-Therapeutic Society. The object of the society is to discuss the question of electricity combined with medicine and surgery. Heretofore the subject has been empirical, and it is proposed to take it out of the hands of the irregulars, so that the regularly certified practitioners can make it popular from a scientific standpoint. One of the Philadelphia physicians has taken a very wise step in the introduction of a small electric machine for the production of ozone. It is in a very compact form, operated by a small battery, and can be conveniently carried. There is said to be a large demand for the machine for purifying the sick-rooms of private patients. An electrician the other day said: "A simple and almost perfect method for purifying the atmosphere of crowded apartments, such, for instance, as railway cars, is to produce ozone by electrical sparks, and the practice has been strongly recommended by the highest medical authorities. The delightful freshness and vigor which is perceptible in the air after a series of sparks from an ordinary influence machine, is a proof of the salutary and refreshing influence produced."

ELECTRICITY FROM HEAT.—The effort to obtain electricity direct from heat, without the intervention of boilers, engines and dynamos, goes on, but without satisfactory commercial results as yet. Edison and Berlinger did something several years ago, but their efforts were not pushed. A Pittsburg inventor claims to have accomplished more. We hear nothing more about "the young man from Maine," or the Hartford company which was to demonstrate his invention.

TABLE OF CONTENTS.

EDITORIALS.—Does It Pay in the End? Prescott, Arizona; For Compressing the Air and Piercing the Rocks, 313. Improving the Great Occasion; The Future of Mining, 320. The African Explorers Ventilate their Exploits, 321.

ILLUSTRATIONS.—The Cummings Rock-Drill and Air-Compressor; View of Prescott, Arizona, 313. Map of Prescott, Arizona, and Surrounding Country, 321.

CORRESPONDENCE.—Prescott, Arizona; The Gold Belt of California; Letter from Arizona, 314. San Bernardino County, 315.

MISCELLANEOUS.—The Utilization of Niagara Falls; Successful Trial of an Admirable Steam Road Wagon; Mining in China; Coolies for Work in Mexico; The Hudson River Tunnel; Immigration; New York Street Cleaning; Union Pacific Extensions; Scarcity of Nickel; A Scheme for Protecting Railways from Flying Sand, 315.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 316-317.

MECHANICAL PROGRESS.—How Metal Wares Are Colored; Lack of Appreciation by Employers; American Razors becoming Popular; New Textile Machinery; Aluminum for Improving Steel; American Steel in Europe; Steel Car-Wheels; The Gifford Gun; Miscellaneous, 318.

SCIENTIFIC PROGRESS.—Mind and Matter in Science; Eels in Vinegar; Silver in Volcanic Ashes; An Aid to Geological Explorations; A Prehistoric City; Marvels of Mechanical Skill; Variations of the Magnetic Needle; Maple Sugar of Indian Origin; Phospho-boric Glass for Microscopes; A Luminous Buoy, 318.

ENGINEERING NOTES.—Possibilities in Shipbuilding; The Present and Possible Speed of Ocean Steamships; A Five-Masted Ship; The Fastest Sea Boats Now Afloat, 319.

GOOD HEALTH.—Washing Out the Stomach; Water and Salt; To Avoid Diphtheria; Precautions Against Consumption; Hydrophobia Treatment in New York; Pasteur in Russia, 319.

USEFUL INFORMATION.—Can We Manufacture Fine Linen Goods? A Substitute for Tobacco; The Boston Franklin Fund in Danger; Salt as a Preservative; A Huge Blast; Wooden Flour; A Large Ostrich Farm; All the Same Either Way; Miscellaneous, 319.

ELECTRICITY.—Accidents from Electric Wires; A New Electric Car Starter; Electricity in Medical Practice; Electricity from Heat, 319.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 324.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 324.

Passing Events.

With some signs of an approaching change, the heavens continue to maintain the brazen aspect worn through all the summer and far into the fall months. Throughout all California there would be welcomed now a soaking rain.

The early part of the week was signalized by such a tumble in prices in the Eastern stock market as came well-nigh precipitating a panic, nor is the danger of such result fully over.

A queer notion has gotten into the heads of the Indians throughout nearly all parts of the interior, these poor people being excited over the expected coming of a Messiah, who it is believed will destroy the whites and restore the aborigines to their ancient possessions.

There is being developed in Belgium a strong sentiment in favor of substituting a republican in place of a monarchical form of government.

The great labor strikes long pending in England and Australia seem to be everywhere on the wane, sometimes through concessions made by the contending parties, oftener through the sheer exhaustion of the strikers.

The project of a railroad to be extended the whole length of Central and South America appears to be meeting with favor in strong financial quarters.

While the Nicaragua canal is making satisfactory headway, the affairs of the De Lesseps ditch seem to be going from bad to worse.

In their mutual recriminations, Stanley and his aids are charging each other with murder, cannibalism, poisoning, and a variety of other barbaric pastimes to the general disgust of the public, while a sensible impartiality credits in part the stories of both.

The sound and fury of the late election has so far subsided that there is heard now only the complaints of the defeated and disgruntled office-seeker and his friends. The results stand something like the popular beverage of the Britisher, "'alf and 'alf."

The town of Truckee, Nevada county, nearly half of which was destroyed by fire on the morning of the 8th inst., is being rapidly rebuilt.

The tower of Babel is to be reproduced at the World's Fair; of course, on a small scale, and this time from stone, brick and iron instead of adobe, as before.

Improving the Great Occasion.

If the mineral resources and products of California are to be adequately represented at the Chicago World's Fair, it is time we were beginning to move in the matter. Already, States comparatively poor in this respect have taken preliminary steps looking to such end, thereby setting an example that might here well be emulated. It should not be forgotten that California outranks all other countries as regards the varied forms of her mineral wealth, nor yet, that she remains still the largest producer of gold in the world. There can be collected in this State a greater variety of the useful metals and minerals than in any other State or Territory in the Union. We have here every valuable product that occurs in the mineral kingdom, with some rarely found elsewhere, though of the first economic importance. We could, with little exertion and at small expense, make such a display in this department as would not only overshadow all competitors but greatly advance our material interests and glorify the State, and we must see to it that this is done.

But it will not be done unless the people addressing themselves to the task take care that the Legislature, at its next session, provide funds for the purpose. Enough money must be appropriated by that body to defray the cost of collecting, preparing and forwarding to Chicago specimens of every valuable metal and mineral found in the State, including expenses of suitable persons to see that these specimens are properly displayed and to care for them during the Exposition and after it is over.

Not soon will California have another such a grand opportunity to advertise her mineral resources, wherefore she should now strive to make the most of it. And in availing herself of this opportunity, she must not, as on former occasions of this kind, be forced to have recourse to begging subscriptions or to borrowing from private individuals, in order to make a presentable appearance at one of these national shows. Not again must we be subjected to the humiliating spectacle of passing around the hat as a means of raising funds for effecting an object of such general utility. It will become the duty of the Legislature to save us from a repetition of such indignity, nor is it likely that the enactment of a law looking to such end would invoke serious opposition.

As an encouragement for us to act promptly and vigorously in this matter, it may be stated that at a late meeting of the World's Fair directors, the big underground mining exhibit, suggested by Col. Browne of Colorado, was determined upon, this proposition having before been indorsed by the National Commission. In carrying out the plan suggested, it is proposed to have constructed a palace 500 feet below the surface of the ground, traversing which there will be drifts filled with ore in such manner as to represent the underground workings of the leading mines of the country. The site of this exhibit will be on the lake front, the work being performed by a separate corporation, composed chiefly of mining men. This, of course, is aside from the mineral specimens on view in another part of the exposition, but it illustrates the importance attached by the managers to everything pertaining not only to the mineral wealth of the country but also to the department of actual mining.

Presuming that our people will determine in favor of having our mines and minerals duly represented at the coming World's Fair, the question arises as to the best means available for effecting this purpose. But we need not look far for this; undoubtedly the State Mining Bureau now, as on previous occasions of this kind, presents the best medium for carrying out this object. Here we have an institution already organized and in good working order. It belongs to the State and is in charge of State officers. Its duties are kindred to those required to be performed, and it can, under that clause of the law which empowers the trustees, acting in conjunction with the State Mineralogist, to provide for a display of the Bureau's mineral cabinet at any World's Fair when they see fit, be employed in the manner above suggested.

The Board of Trustees of the Mining Bureau consists of men who, in a matter of this kind, can be fully trusted. Acting with the State Mineralogist, they would constitute a board eminently well qualified to determine what should be done in the premises; wherefore it would be the part of wisdom for the Legislature to take counsel of them.

In the first place, it might be found that many mineral specimens could be spared from the Bureau's collection without detriment to the institution. Where there are duplicate samples this could always be done. Then the Bureau, being so thoroughly organized and centrally located, could be made a nucleus for the ingathering of minerals from every quarter. Reaching this central depot, they could here be assorted, properly labeled and packed preparatory to shipment to their place of destination. That an appeal to collectors, miners, quarrymen and others engaged in similar pursuits, instructing them as to what sort of mineral specimens were most required and how to select them, would meet with a ready response from these parties, might be fully counted upon. Adopting this plan, a splendid mineral exhibit could, without much cost and to the great benefit of all concerned, be made certain. In drawing on the Bureau it would not do to so deplete its mineral cabinet that visitors would have just cause to complain of its impoverishment. Nor would this be necessary in a country so rich in this species of natural wealth and in which mineral collections do so abound.

In making choice of an agent to look after this collection at Chicago, care should be taken to select a thoroughly competent party, to the end that the mistake of subordinating the State Mineralogist to a person devoid of the first qualification for the place, as was done in the case of the New Orleans Exposition, be avoided.

Contributors should bear in mind that all samples sent to the fair will remain subject to their control; that is, they will when the exhibition is over be returned to the owners or be otherwise disposed of as they may direct. If returned, they will be so carefully packed as not to be damaged by handling or transportation.

Mr. Irelan, the State Mineralogist, holds himself in readiness to co-operate with the trustees of the Mining Bureau and other public authorities to the fullest extent possible. The resources and entire machinery of the Bureau, as well as his own services, will be placed at their disposal, so far as he has legal warrant for doing so.

A NEW YORK DISPATCH of recent date says: The Mississippi river commission finished its labors Saturday night after appropriating over $3,000,000 for improvements on the lower Mississippi and its tributaries. The original amount appropriated for the work was $3,200,000, and it is nearly all used up as follows: For dredging the Mississippi river from Cairo to White river, including Pin Point reach, $500,000; for the same kind of work from White river to Warrenton, including Lake Providence reach, $720,000. For the building of levees these amounts were appropriated: Yazoo front for levee, $300,000; Tensas front for levee, $500,000; White river front for levee, $200,000; below Red river for levee, $200,000; Greenville harbor, $100,000; for Vicksburg harbor, $75,000; for New Orleans harbor, $100,000; Red and Atchafalaya rivers, $250,000; survey and expenses, $225,000; total, $3,170,000. The commission will report to the Secretary of War, and as soon as he approves the apportionment the work will be begun.

The Future of Mining.

In speaking of the business of mining on this coast, we know what is past but can only guess as to what lies before us. But with all we have accomplished, and it amounts to a good deal, we are yet only learners. Much of what has been done, both as regards money expended and labor performed, has been preliminary and experimental. As we have been learners, so are we learners still and such we will remain for a long time to come. We were at the outset profoundly ignorant of this business. We had to learn its very alphabet. We were without knowledge, technical or practical. Our teachers, brought mostly from abroad where they had worked under circumstances widely different from those that here prevailed, in attempting to adapt themselves to their new conditions, blundered badly. Our leaders misled us; our trusted men were at fault. If, then, much that has been done has been done badly, little wonder. If disappointments have come and losses been sustained, we should be judged lightly.

But this is of the past—what of the present and what of the future? Just this: We are now doing our work tolerably well, but will do it much better hereafter. Gold-mining is today as safe and as remunerative a business as any other pursuit in California. There has not occurred here one signal failure in this business of late, and if there have happened some of minor importance these will be fewer hereafter; and it is with us a good time now to engage in this industry—a better time, perhaps, than it will be later on.

Our claim-owners, impoverished and weary with long holding on, are willing, and even anxious, to part with their properties on reasonable terms. Undeveloped and partially developed mines can be bought cheaply—very often at prices far below their intrinsic values. It may not, and probably will not, always be thus. By and by mines will be bought not only to be worked but to be held for a rise in the market. When that time shall come these properties will appreciate, for there will be competitive buyers.

The most of us will live to see the gold mines of this State classed among favorite investments. With some far-seeing capitalists they are so regarded at present. The day of the adventurer and the wildcat is over. The era of disappointment and loss has about ended. Disaster is about to give way to success, and timidity to a well-founded confidence. All hail the day these transformations shall be fully effected.

ADVICES from Colorado convey the information that a miners' home is soon to be established at Denver by private contributions. It is to be open to indigent and homeless miners. It is not to be considered a charitable institution, but one upon which the miner, by nature of his occupation, has a claim. In few occupations are the perils so great as with the miner. He is constantly in danger of losing life, limb or health while working for his daily bread. These homes, of which there are several in different parts of the country, serve to mitigate the miseries attendant upon indigent old age. From a humanitarian standpoint it should receive hearty encouragement. The administration of this home has been placed in the hands of an excellent managerial board, which fact, together with the worthy purpose which it is calculated to subserve, goes far toward insuring its success.

IN consequence of the colliers' strike, the ironworkers at Melbourne are exhausting their supplies of coal. Many hands have already been dismissed, and a general stoppage of the works is threatened.

THE German builds his railroad cars for men. He puts his cigar-holders and match-receivers into 19 compartments out of 20, the twentieth being nominally, not often actually, reserved for "non-smokers."

A SCHEME is under consideration for the construction of a railway up the Jungfrau in Switzerland, one of the loftiest of all the Alpine peaks.

IT is thought that the Ericsson submarine guns can be converted into smooth bores, thereby saving the Government much expense.

THE Americans can now successfully compete with foreign nations in the making of first-grade steel.

The African Explorers Ventilate Their Exploits.

There seems now a danger that in the Kilkenny cat fight being waged between Henry M. Stanley and his lieutenants both parties will come out badly damaged, as each appears able to tell some very hurtful stories of the other. So long as left to toot his own horn it was an easy matter for Stanley to make himself out a hero, but with these counter-blasts these heroic proportions threaten to shrink into the dimensions of a pigmy.

Just now Henry M. is entertaining the New Yorkers with an account of his exploits, which they appear to enjoy with a hearty relish, as why should they not? A people who are ready to accept the caricatures of Harte and Clemens as veritable facts ought to be able to swallow the Munchausenism of Stanley without undue strain of the gullet.

We venture the assertion that there can be found a thousand prospectors on the coast who, in the prosecution of their calling, have undergone more hardships and braved more dangers than ever did this much-vaunted African explorer. And yet these men would blush were they made the recipients of the fulsome praise with which this pet of the drawing-rooms has been heslobbered, both in this country and England.

A BETHLEHEM, Pa., dispatch, dated October 27th, says: A monster casting, the largest ever undertaken at the immense plant of the Bethlehem Iron Company, was successfully made to-day. All the cupolas, six in number, in the Bessemer department, besides number one and two furnaces, were used for this casting. One hundred and twenty-five tons of metal were melted, then poured into ladles placed on trucks, which were transferred over the narrow-gauge railroad by means of small locomotives to the mold in the open-hearth department connected with the ordnance plant.

Prescott, Arizona.

(Concluded from page 314.)

nerated there will be great expansion of work in this camp, and even additional labor will be needed.

Our correspondent's next visit was to the Senator mine, 12 miles east of Prescott. The increasing importance of this mine has encouraged an experienced stage man to put on a daily conveyance, and the Senator can now be reached with ease. This property is one of a number of mines owned in Arizona by Phelps, Dodge & Co. of New York, the well-known metal-broker firm. One of the company's great mines is at Bisbee, Cochise county; another is the Old Dominion mine, in Gila county, while in the vicinity of Prescott the Senator, the Boggs, the Hackberry and the Copper Basin are all under the same management. One of the company's great mines is at Bisbee, Cochise county; another is the Old Dominion mine, in Gila county, while in the vicinity of Prescott the Senator, the Boggs, the Hackberry and the Copper Basin are all under the same management. The company will be erected an extensive smelter to treat the ores from their various properties as well as the ores from Big Bug and other districts. They already have one smelter in Copper Basin. The same company is also said to be seriously contemplating the building of another narrow-gauge railroad from Prescott through Groom, Hassayampa, Turkey Creek and other mining districts to the mines of Bradshaw district.

While in Prescott, our correspondent learned that the Ryland mine, 45 miles south, was soon to be put under new management. The prospects are that its extensive plant, including a 20-stamp mill, will be utilized to good advantage, and the property will be made to show up to much better advantage than it has in the past.

All indications seem to point to the fact that a new era in mining has dawned for Prescott. Men of capital are pushing work on their properties, and this gives confidence to smaller operators, of whom there are a legion. There is a buoyant and hopeful feeling which will tend to carry many enterprises to a successful issue.

Among the gentlemen whom it was the pleasure of our correspondent to meet while in Prescott, the following, in addition to those named in the previous part of our letter, are more or less interested in the mining industry: Ex-Gov. Tritle, one of the most public-spirited citizens of Arizona; Basford & Burmister, the leading merchants of the city, who own scattered mining properties in different states of development all over the tributary region; E. M. Sanford, a leading attorney, but a gentleman who devotes considerable attention to mining matters; the president and other officers connected with the Bank of Arizona, one of the wealthiest banking corporations in the Territory; Julius Baumann, mining expert, civil engineer, etc., a gentleman well versed in all mining matters of Northern Arizona; W. H. Hatcher, superintendent, and John Front, foreman, of the Senator mine; R. H. Hetherington, assayer, well qualified for his work by many years' practical experience; J. W. M. Moore, of the Arizona Real Estate, Loan and Investment Association; W. M. Claypool, of the Prescott Ore Works, who has a fine sampling plant where he treats ores that are shipped in from a radius of 100 miles; J. Dudley Helm, of the Tiger mine and other properties; Clark & Adams, proprietors of Prescott lumber-mills, who have varied mining interests, among which is a five stamp mill; C. R. Martindell, the leading insurance agent of Prescott, who also lends encouragement to mining matters; J. W. McGowan, proprietor of the Williams hotel, but former owner of the Senator and Congress mines, besides other properties; Dan'l O'Boyle, now devoting attention to hydraulic mines; Dan'l Hatz, B. F. Rigg, G. W. Sines, F. E. Doggett, all of whom have more or less extensive interests in mining claims; Frank Carlisle of the Black Horse mine; J. F. Mahoney, engineer of City Water Works; A. G. Oliver, post trader at Whipple barracks; Freeze & Belcher, H. Olmsted, G. Schuerman, Jas. Shirley, Will Dulin, Jno. Bryant, W. W. Vanderbilt, M. Blauvett, Wallace & Burnett, J. P. Humphrey, M. Maier, Chas. Rice, B. C. Thorne, C. T. Kelly and J. R. Masterson. The above list includes a goodly proportion of the business men of Prescott, which indicates the extent to which the great industry of mining is absorbing the attention of her enterprising people.

H. G. P.

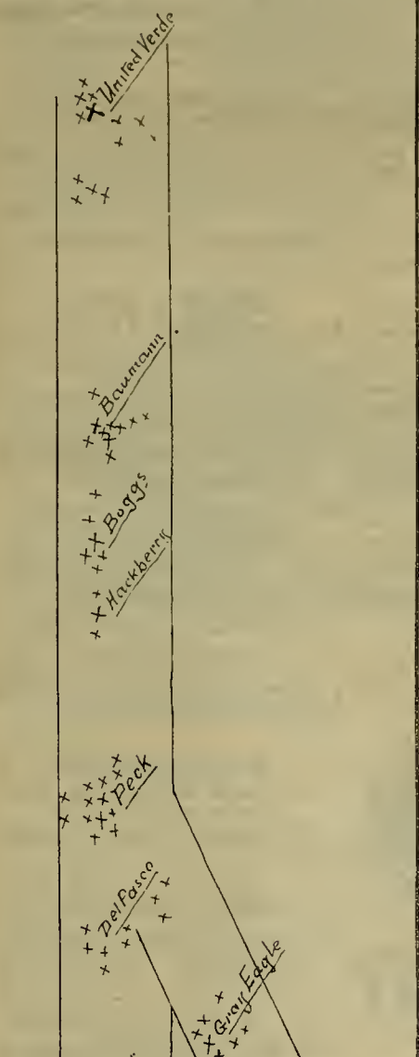

DIAGRAM OF THE GRAY EAGLE AND OTHER MINING LOCATIONS.

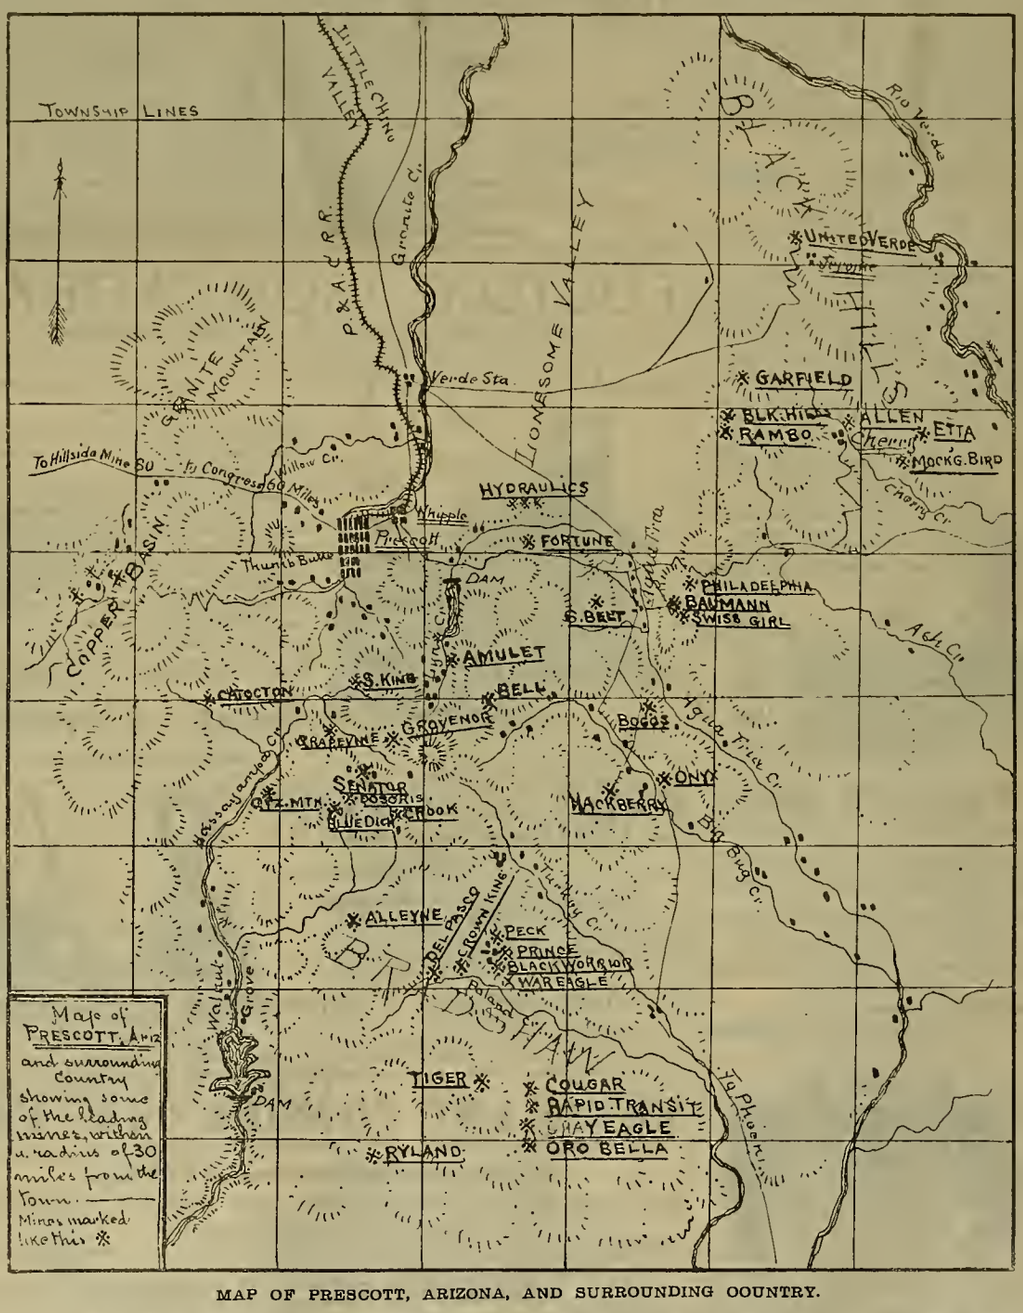

MAP OF PRESCOTT, ARIZONA, AND SURROUNDING COUNTRY.

PASSENGER CARS OF AMERICAN PATTERN are to be put on all German Government railways much used by tourists, says a dispatch from Berlin. The change is to be commenced next summer.

THANKSGIVING.—The President and the Governor have issued the usual proclamations appointing Thursday, November 27th, as the National Thanksgiving. Let all prepare for it,

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6 00 a year; WEEKLY, $2 50, *in advance*.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

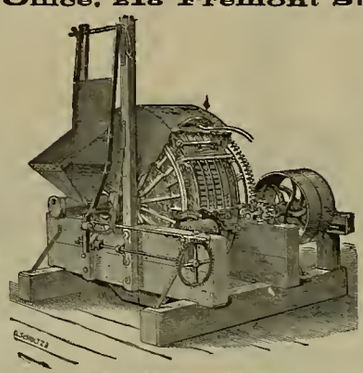
FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 218 Fremont St., San Francisco.

—MANUFACTURERS OF—



TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,
Either for use on Steamboats or for use on Land.

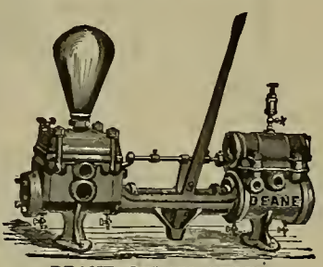
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains **94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

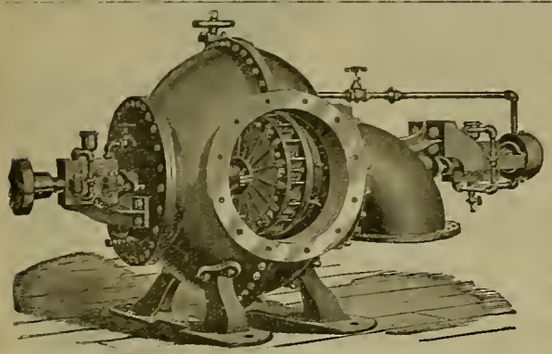
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 13, 1890.

No sooner did the election excitement subside than a money panic at the East and in England set in to disorganize trade. At the close, New York and London telegrams report an easier money market and the panic over. Considerable money is said to have been sent from here to New York so as to take advantage of the high rates of interest ruling in that city. Our money market is fairly easy. Considerable money is being paid for city taxes in various parts of the State. Next month State taxes are due, when large sums will be paid. This money will begin to go into circulation after the turn of the year.

MEXICAN DOLLARS—There was a fair demand the past week for China at 82½@83½ cts.

SILVER—Considering the close money markets abroad and at the East, silver stood up well, but this was largely due to Government purchases, which with the month not half gone, were nearly 3,000,000 ounces. The following telegrams give particulars of the purchases:

WASHINGTON, Nov. 7.—The amount of silver offered for sale to the Treasurer to-day was 1,045,000 ounces. The purchases aggregated 420,000 ounces, as follows: Fifty thousand at $1.022, 60,000 at $1.035, 100,000 at $1.0245, 130,000 at $1.025, and 30,000 at $1.026.

NEW YORK, Nov. 7.—Dow, Jones & Co.'s News Agency publishes a letter from a London banker on the recent fall in silver. He says: "The market bas deprived us of support from India, there being no disposition to ship to the East, where money rules at an abnormally low rate. The chief cause of the decline is the high rate for money on both sides of the Atlantic. There is no feature in Mexican dollars."

WASHINGTON, Nov. 10.—Six hundred thousand ounces of silver were offered and purchased at the Treasury to-day as follows: One hundred thousand ounces at $1.0299, 50,000 at $1.031, 100,000 at $1.032, 50,000 at $1.033, 100,000 at $1.0345, 100,000 at $1.036, 50,000 at $1.037, 50,000 at $1.0373. The amount of silver purchased at the Mints during the week ended November 8th was 275,889 ounces. The total amount purchased for this month, including purchases at the Mints and to-day's purchase at the Treasury, is 2,180,333 ounces.

WASHINGTON, Nov. 12.—The amount of silver offered to the Treasury to-day was 862,000 ounces. The purchases were 737,000 at $1.032@1.0395.

QUICKSILVER—Receipts the past week aggregate 378 flasks. The market has held to steady prices.

BORAX—Receipts the past week aggregate 224 ctls. The market is quiet but firm.

ANTIMONY—The market is a shade easier in sympathy with lower prices at the East.

LIME—Receipts the past week aggregate 5025 bbls. and exports 700 bbls. to Honolulu and 300 bbls. to Kahului. The market is steady with a good demand reported.

IRON—English advices report a strong market under a growing scarcity of "makers' iron." At the East the market is quiet. Our market is steady.

TIN—The market for hoth plate and pig is reported dull but steady. Large quantities of plate will be due to arrive here before the increased tariff on the same takes effect. A London cable to *Iron Age*, Nov. 6, says: The market for tin plate has been firm, but quiet, buyers being still inactive, while makers bold for full prices. There are, however, negotiations pending on large quantities for delivery during the early part of next year, including some interest on the part of American buyers.

COPPER—The markets of the world appear quiet but steady. Stocks are being steadily reduced, which after the turn of the year ought to have a favorable influence on the market.

COAL—Imports the past week aggregate as follows: Nanaimo, 4308 tons; Coos Bay, 500; Departure Bay, 2253; Comox, 2350; Seattle, 7250; Tacoma, 5900; Newcastle (England), 1731; Hull, 247. Total, 24,539 tons. There were exported the past week 350 tons to Kahului. The market has not appreciated as dealers expected, continued mild weather being against holders. Receipts of coast coals are increasing. Australian for January shipment is offering, which indicates that the strike is off. With free shipments from there, prices cannot hold up after this year, particularly with coast coal coming in freely.

Eastern Metal Markets.

By Telegraph.

NEW YORK, November 13.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	.48	1 04½	$16 75	$5 87½	$21 20
Friday	.47	1 02	16 75	6 25	21 00
Saturday	.47½	1 02⅜	16 75	6 35	20 95
Monday	.47½	1 02½	16 75	5 20	20 90
Tuesday	.47½	1 02½	16 75	6 20	20 90
Wednesday	.47⅜	1 02½	16 75	5 20	20 90

NEW YORK, November 11. — Copper—Quotations unchanged; all grades in the London market declined to £56 12s spot, £56 15s future. Pig lead is ecilinc in small quantities, $5.25 prompt, $6 15@6.20 for near future. Those prices apply to domestic and foreign deliveries on old purchases to keep the consumer supplied. There is comparatively little accumulation. The prices would be stronger if the European supplies should fall off.

Mining Share Market.

In last week's issue we stated that well-informed operators looked for a sharp setback before higher prices prevailed. The decline has come, although there are those who claim that prices must go still lower before there are much higher figures. This opinion is said to be based on information obtained from the mill pool or ring. The latter are trying to get the market very low so as to break the outsiders who are fighting for honest mine management, and at the same time make the reform movement odious. Stock dealers must not forget that to save a life amputation of a limb is often necessary. So it is in this case, to save the mining industry, dishonest mine management must be cut off, and the first step in this direction is to report all work done in the mine, ore struck, its width, assay, etc., car samples and battery assays, and everything else reported in detail for inspection of stockholders. The next is to get mine and mill officials whose word is as good as their bond. Moneyed men are slow in buying stocks unless prices get low and then sell at each small advance, for to buy at high prices past experience has demonstrated that it is tails outsiders lose and heads the mill ring wins. It has apparently come to such a pass that an ore development on the Comstock lode is looked upon as a disgrace. This can be qualified by saying it is a disgrace, provided outside dealers have the stock. At the decline this week, large lines of margined stock were uncovered —even cash stock was sold by outsiders. In outside stocks there was more activity in the Bodies at declining prices, and in the Tuscaroras at better prices, owing to Commonwealth declaring a 20-cent dividend. The Quijotoas were more or less neglected.

Another bullion shipment is expected from Bodie on next Monday. It will be the monthly cleanup. How much there will be is not reported. As the pool bought a good deal of Bodie stock at declining prices, the shipment may be quite large so as to make another peddle of this stock at a good round profit. Extensive and important prospecting work is being done in the mine.

The money panic in London and New York and a crash in railroad securities is said to have had an unfavorable influence on mining shares. Bankers called on brokers for money, and in turn brokers called on margin buyers for money; the latter failing to respond were closed out. Many on first demand for money sold out, others put up more money or stock, and in the end all or the major portion went. The short interest has filled at a good profit. The market opened this (Thursday) morning steadier, hut after Call the tone was heavy, owing to Potosi weakening. Well-informed parties look for Potosi and also Confidence to go lower, which they claim will send the entire list lower.

News from the mines continues scarce, which is an unmistakable evidence that insiders are buying stock. Whenever hig hull news from the mines gets out it has invariably been accepted as a sure indication that insiders are selling. Advices from Potosi report that another west crosscut has been started about 50 feet north of the first crosscut on the 1130 level. In the first crosscut ore was run into assaying $40 a ton which has a width of from 12 to 15 feet. In Hale and Norcross important work was started the past week, as there was in Crown Point. In the latter mine a southwest crosscut was started to tap the ore known to be on that level. The pumps to pump out the Gold Hill mines can be started up at any time the stock market in this city justifies. As for that, very rich ore can be shown up in one or more mines on the Comstock when the stock market is in good position for an up move, that is, outsiders have few stocks. It looks as if the latter are well cleaned out now, although another scare may he necessary to do the work.

ANNUAL MEETING.—THE REGULAR annual meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the company, room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on MONDAY, the 17th day of November, 1890, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 14th, at 3 o'clock P. M.
ALFRED K. DURROW, Secretary.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of October, 1890, an assessment (No. 20) of Six Cents (6c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of December, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. BARROWS, Secretary pro tem.

Office—Room 11, No. 303 California Street, San Francisco, California.

—AND—
Ore Dressing Machinery.

By C. G. WAMFORD LOCK.

CONTENTS.—Motive Power—Transmission of Power. Quarrying—Prospecting, Shaft-sinking, Coal-cutting, Pumping, and Ventilating Machinery—Lighting—Hauling and Hoisting Transport—Reducing Dressing—Miscellaneous.

Price $21.00. Circulars and Catalogues on application.

E. & F. N. SPON, Publishers,
12 Cortlandt St., New York.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to Intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

GRANGER'S ROLLER STAMP MILL
Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
The very best. Uses no water. No freezing up. Saves hoisting waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

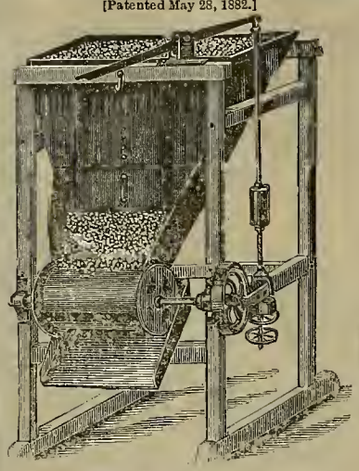
THE ROLLER ORE FEEDER
[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.
In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,
Sole Manufacturers,

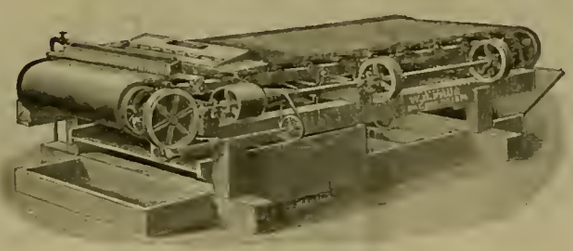
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

(PATENTED.)

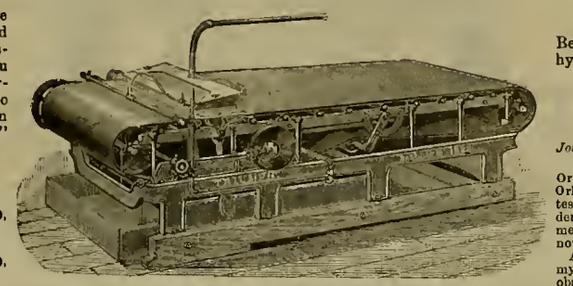
The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphe") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

—o—

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be.
Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentratore is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentratore were purchased, and twenty-eight (28) are now in constant successful operation.

The Rife Hydraulic Engine or Ram.

As Californians more than almost any other people are apt to concern themselves in all that pertains to the elevating of water, whether for motive-power, irrigation or other purpose, many of our readers will feel an interest in a new contrivance designed for water lifting and known as Rife's hydraulic engine, now coming into extensive use both here and elsewhere, the cut standing at the head of this article giving a good idea of this machine as an entirety.

This contrivance, though not new in principle, has been so modified and improved as to constitute it virtually a new machine, all earlier defects having been so entirely eliminated from this that in it the *ne plus ultra* would seem to have been reached in this department of invention. The defects here alluded to had so impaired the old style of hydraulic ram that, while there was a wide field for its employment, its use was comparatively restricted, these defects having to all appearance become chronic.

Through their cure a great impetus has been given to the manufacture of the Rife engine, which is now being introduced to the exclusion of everything else of the kind.

The principal trouble with the old hydraulic machine was the want of an automatic air supply, a trouble that in the Rife patent has been obviated. Increased suction, by means of an elevated base, has also been attained during the action of the ram. Through the employment of rubber-lined valves in the new invention, the jarring stroke incident to the use of heavy metallic valves is avoided; a free escape of water is also provided for, the flow being easily regulated by means of a lever and adjustable weight, these composing but a portion of the many improvements that characterize the new apparatus and commend it to general use.

One of the Rife engines having been purchased by D. B. Hays, can be seen at work on his place near Oroville, Butte county, the manufacturers referring to that gentleman for information as to practical results. These machines are manufactured at Roanoke, Va., by the Rife Hydraulic Engine Company, to whom all communications relative to the same should be addressed.

THE Northern Pacific Railroad is preparing to erect coal bunkers at Sprague to cost $10,000.

THE RIFE HYDRAULIC ENGINE.

Fuel Gas.

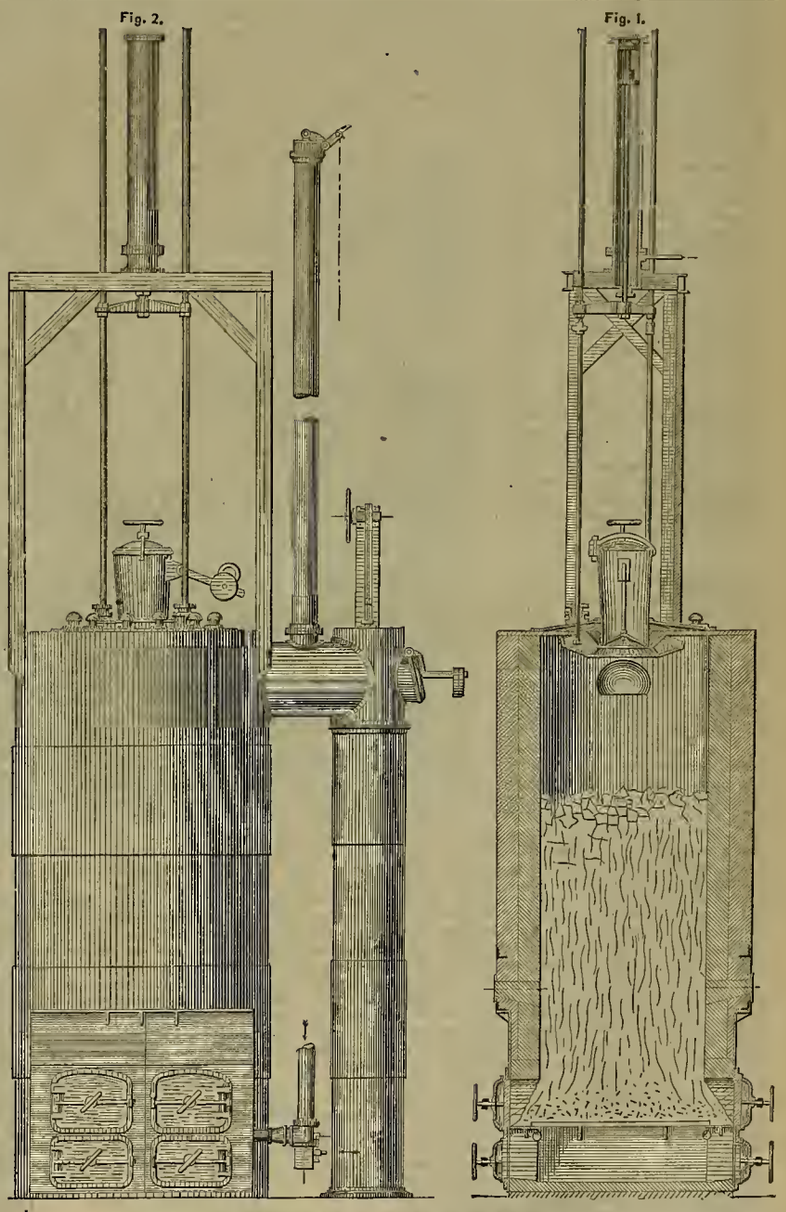
Mr. Geo. W. Goetz of Milwaukee, Wis., in a paper read before the American Institute M. E., in speaking of producer gas, says: Producer gas is undoubtedly the cheapest fuel gas that can be made, and answers all purposes where the air necessary for its combustion can be heated by the off-going heat of the furnace. Tests have shown, however, that producer gas carries too much nitrogen to permit its distribution to a community, since, in consequence of the presence of this constituent, its calorific power is too low, and its flame extinguishes so easily as to be dangerous for household use. It was important to know how many cubic feet of producer gas one ton of coal will give. Conflicting statements as to this point will be found in the literature of the subject, the figures ranging from 150,000 to 250,000 cubic feet per ton.

The accompanying figures show a producer similar to the one used, which was specially designed for a large production of producer gas, and for making a mixture of producer gas and water gas. Fig. 1 presents a vertical section, and Fig. 2 an outside view of the producer. The shell is 20 feet high, 9 feet 2 inches in exterior diameter, and, inside the lining, 6 feet in diameter. The lines of the producer, as shown in Fig. 1, are vertical. This is a good construction for a producer in which many different kinds of fuel are to be gasified; but it is not advisable to copy these lines for every fuel. Experience has shown that the lines to be given to a producer should depend upon the nature of the coal to be gasified therein. Having large cleaning and ash-pit doors on both sides, opposite each other, the producer can be cleaned without great difficulty, even when a large accumulation of clinkers has taken place.

In order to get a gas very low in carbonic acid, a much larger depth of fuel than is generally carried in producers was required; and, as it is impossible to poke by hand such a deep fire, a pneumatic rammer was placed upon the producer. This rammer consists of a cast-iron ring, so constructed that it will not only exert a pressure upon the coal, but also from the coal to the periphery of the producer. The construction is clearly shown in the figures.

KEENE, N. H., is to have a new industry in the shape of an artificial granite manufactory which will build and utilize a building 130x30 feet, two stories high, with engine-room, stock sheds, etc.

Fig. 2. Fig. 1.



PRODUCER FOR FUEL GAS.

What Greeley Would Say.

Were Horace Greeley alive and with us to-day, what, we wonder, would be say to the young man consulting him as to a place of residence and a choice of pursuits? Were some of our young men to apply to the Philosopher of the White Hat for advice as to where they had best go, he would, in view of their worthlessness, very likely tell them to go to "sheol." He could not consistently tell them to "go West," as this, under existing geographical conditions, would be preposterous. This wise man, were his counsel thus sought after, would probably say: "Boys, remain where you are—you need not look for nor can you find any better country than this; stop here and go to work—cultivate good habits and save what you earn." As a first step toward bettering your condition, harden the inside of your palms with a pick or an ax-handle, or some such implement. This done, and all demoralizing practices avoided, you cannot fail to come out right." And now let us say to the youth of California, having virtually followed Horace Greeley's advice by getting as far west as you well can, follow now the rest of his advice; go to work at any honest employment for which you are fitted or for which you can readily fit yourselves; eschew cards, billiards, stock deals and all other hurtful pastimes and forms of gambling, and you will have made sure of all that is best in this life and that which is to come.

THREE of the largest iron and steel mills in the country, Homestead, Braddock and Oliver's, have voluntarily enforced the eight-hour day.

The Gold Belt of California.

NUMBER II.

The Ancient Placers and Their Relation to Wall Rocks.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON, Kernville, Cal.]

The light of experience must guide us in determining what should constitute wall rocks, and why we should expect to find that in certain localities the ancient channel only grazed the outcrop of the gold-bearing matrix and left the great body of its wealth penetrating the earth to great depths. We must remember, however, in the face of experience, that there is a theory that the wall rock is to the lode merely that of the product of the molders' art, that it gives shape merely to a vein of eruptive matter. If this latter is true, then there is no use of studying geological formation, as a gold-bearing lode may be found wherever a rent may occur in the earth's crust. This letter theory is responsible for half the mining failures that have occurred on the Pacific Coast since Marshall's discovery. It was responsible for the squandering of $50,000,000 in the bottom of the Comstock, below the realm of profitable mining, and finds a place in that portion of the literature of to-day published at public expense. A theory which has wrought so much evil should be able to vindicate itself by reference to some one fact established in its favor, or some one dollar secured as a return for the millions squandered, or it should cease to pretend to the position of a scientific truth. Unfortunately such is not the case. Nine-tenths of our mineral lodes fail to penetrate the earth as deep as the gorges of the modern streams. The great mother lode is broken up, scattered, demoralized or absent in the beds of all the rivers it crosses. Few if any of the explorations in the ridges have reached the level of adjacent river-beds; and still we are to be told, by authority, that the talk of "gold ores" must only excite a smile with scientific men, and that gold is found only in positions consistent with mechanical deposit by eruptive force.

Gentlemen, stand aside; don't allow yourselves to remain a drag-yoke upon the neck of civilization. We will show you that gold is found in certain fixed geological relations; that it exists as a metal, and that it also exists "as an ore;" that it enters into the most intricate combination with many minerals; that it observes the laws which govern the brotherhood of metals, and confuses you only by the fact that it is obnoxious to oxygen.

What rules, then, must govern the geology of a mineral region, and where may we safely look for a paying ledge?

As being first in mineral wealth we will take the calcareous formations. If a lime belt or formation occurs 100 miles wide and of great depth, with no adjacent metamorphism and no intervening formations, the galenas will only carry a low percentage of silver and a bare trace of gold, except near the edges of the formation, nothing more. Where lime dikes of moderate width contact with mica slate, talcose slate, or any of the highly silicified or metamorphic rocks, whether eruptive or otherwise, minerals containing any or all of the metals may be looked for in or near one of the contacts. This rule may be carried up through all the grades of calcareous and carboniferous slates. In many places numerous small veins rising in the granite a mile away will be seen heading for the contact and expanding into a complicated system as they approach. But as most of these lime formations trend south about 24° east in California, and as there is a very marked difference between the conditions observable in the two walls, I will leave the explorer to determine for himself some of the mysteries hidden there. For 15 years I have been fully impressed with the idea that the vicinity of the calcareous contact not only gave birth to a high percentage of the gold of the ancient placers, but that the adjacent lime, acting upon the silex and sulphur of the matrix, released the gold and offered it to the current in its present form.

I have no theory to which I have not been involuntarily led by observing facts. So far as my observations go, what is known as pocket mining, where fortunes have been realized in a day, were all near the contact of a calcareous formation. If we accept this as a rule, we shall see how very little of the wealth of the earth's crust is exposed to man's grasp. Take the bed of Owens valley, where the granite end the silurian rocks meet. We see this decomposition is going on, the sulphur, the lime, the silex and the soda, the boracic acid and potash, are being carried forward by decomposition; but the contact itself is left to the realm of seismic forces. On a smaller scale the same rule will apply to the valley of Kern river below Kernville. This latter formation expands a few miles to the southeast of Kernville, and before dipping beneath the desert near Mojave station, on the railroad, is seen to offer one of the most promising of unexplored regions, and from its trend is doubtless part of the system lying east and north of the San Bernardino range. There may come a day when the tremendous amount of oxygen required to metamorphose those older rocks and give them a granitic cast may inflate the Owen-river region into a mountain, and then there will be good mining there. While the lime itself will not be metamorphosed into granite, it will yield up its sulphur now combined in the form of gypsum and become a more perfect granular mountain limestone.

When we see where granite has been in the melted form, and has run in a regular flow, and now reposes on the broken outcrop of vertical slate; when we see silurian slate half metamorphosed into granite; when we see the immense gain of oxygen in these altered forms, and see the escape of sulphureted hydrogen from the contact, and conclude that for a certainty water le surrendering its oxygen to the granite, we say this is the place where granite is made; and when the action is rapid, the movement shakes the world. Such forces have elevated vast areas and have left us dead-river channels far above the beds of modern streams. In the conversion into granite the bulk of the rock is nearly doubled, while its ponderosity is increased, there being in a cubic foot of granite once and a half as much weight of oxygen as the whole weight of a cubic foot of water. In a Pickwickian sense, our lost rivers may be said to be engaged in the laudable work of elevating real estate.

There must have been a time when silex and sulphur were combining with metals and forming themselves into solid lodes. There doubtless was another time when this same sulphur, under other circumstances, was aiding to decompose the quartz and to soften the walls of the lode. It required millions of years to work these changes. While these changes were going on the forces employed were converting the lode into one vast voltaic pile, the earth itself was a vast magnet, and these, acting in harmony with the law of affinity, which gives to each angle of crystallization its own substance, were drawing the atoms into grains.

The forces which elevated the ancient river-beds may have hardened subjacent formations, and the incasing walls of the lodes which imparted their wealth to the ancient rivers may have been soft and friable. The sulphurets in the lode may have been decomposed and the gold thus exposed to the current as denuding occurred. On any smaller scale we know such chemical changes would beget electric currents, and we know that the earth is a great magnet. We know that the electric current revolves only upon the surface of the magnet. We know, further, that wherever met with it is engaged in transferring metals in solution. Let us add now one other fact. Eruptive forces have not occupied the metal-bearing fissures since the formation of the matrix only to destroy it.

There may be chemical agencies at work in regions noted for the display of eruptive force. There are certainly chemical agencies at work where no such force has ever been directly manifested. Perhaps it will be urged that the two forces differ, mainly in intensity. I grant this affinity of origin, yet the presence of an eruptive force is not the place for the formation or the perpetuation of the gold-bearing matrix. Let us learn to discriminate between chemical and physical results. Let us learn to scout the idea that the fighting qualities of the soldier are fortified by mixing gunpowder with his brandy.

If the earth is a great magnet and magnetism has anything to do with fixing the position of the metal in the lode, then there must be a difference in the character of the deposit on the two sides of the lode. Some one will say, "Oh, yes, there is a difference between the foot and the hanging-wall, but what I want to know first is which is the hanging-wall? The magnetic needle points to the north. Electric currents run at right angles with the course of the magnet. Now how do these suggestions fit the information about the hanging-wall?" Let us change the form of inquiry. "Is the diabase in the west wall, or is the great field of granite there? Is there calcareous slate or serpentine back of the diabase?" Let us know something of the surroundings. Never mind the "foot and hanging-walls," except you give something of these. We have started out for original research. We have squandered our money by following a beaten path long enough. The object was to try to give some suggestion as to where the gold of the ancient placers came from. It was not intended to refer the mining public to Webster's dictionary for the information, nor yet to Dana's "Elements of Geology." The object of the discussion is to try to discover something which no one knows, and yet what every old placer miner would like to know.

(To be Continued)

EIGHT HOURS A DAY.—Regarding the enactment by law of eight hours a day, or 48 hours per week, as the maximum amount of work for adults, it may not be uninteresting to make it known that in the weaving factory at Edenderry, near Belfast, which is the property of Messrs. John S. Brown & Sons, who are well known among the foremost in the production of the finest damask table-linens, doylies and cambric handkerchiefs, the question has been put to a practical test by their enterprising manager. Some two or three years since, Mr. Kirtland, the gentleman referred to, became impressed with the idea that he could reduce the period of weekly labor to five days, and give an entire holiday on Saturdays to all his workers without injuriously affecting the interests of either master or employe. Having now had two years' experience, although the system was only at first tried as an experiment, he finds that all concerned are so well satisfied that they would, on no account, return to the old method. Briefly, the advantages gained have been: An output equal to and even greater than before; the saving of steam, fuel, oil, etc., to the firm and to the workers; Saturdays to themselves, with wages equal to what they formerly earned in six days, because knowing they would be off on Saturdays, they are as anxious to make up their pay as their employer is to grant it. It has also been observed that there are fewer absentees on Monday mornings, and far less broken time. Should any employer or manager wish to try the experiment, particulars of the method of arrangement and system of working it may easily be obtained. It may serve better to elucidate the pros and cons of the discussion than hours spent in theorizing on the platform of St. James' hall.—*Journal of Fabrics.*

SENATOR SHERMAN'S PROPHECIES.—Senator Sherman spoke at the Old City Hall, Pittsburg, Saturday night week, to 4000 persons. In discussing the tariff, he said: "My fellow-citizens, I am as positive as I am of my existence to-day that within ten years from this time we will produce every pound of sugar that is used in this country on our own farms. [Applause.] The farmer will raise the product, and the manufacturer will build these great machines to press out the juice and reduce it to sugar, and thus a great industry, probably employing 100,000 people in this country, will soon be built up in our country. We have put a duty on tin plate equal and a little more than the duty on sheet iron, and the result is we will manufacture in this country of ours within a very short time—and you Pittsburg people especially, because it was largely upon your influence and upon the influence of others that it was done—we will make within five years of this time 360,000 tons of plate tin, and we will make the tin cup so cheap that nobody will growl but the Democrats. Why should not we do it? I am told that now already in Baltimore they are getting ahead of you. They have a capital organized of $7,000,000 to go to work to make tin plate, of which we import now 360,000 tons, and if you Pittsburg people don't hurry up you will get behind in this race, and you ought to be in the lead."

TRANS ANDINE RAILROAD.—The year 1892 will probably be signalized by a most interesting event in civil engineering and in international overland commerce. This will be the completion and opening of the Trans-Andine railroad, the first to cross the continent of South America. It is 19 years since this work was begun, and it is now confidently expected that it will be finished by the beginning of 1892. The road is to run from Buenos Ayres to Valparaiso, a distance of 871 miles. There are now 640 miles of it finished at the Buenos Ayres end, and 82 at the Valparaiso end. Of the remaining 149 miles about one-third is practically complete, and the rails laid. The passage of the Andes is accomplished at the Cumbre Pass, which is 13,045 feet above the sea level. The railroad, however, does not reach the summit of the pass, but pierces the mountain by means of a tunnel more than three miles long at an elevation of 10,450 feet above the sea. The grades are, of course, very steep. For a considerable distance the rise is more than 422 feet to the mile, or 1 foot to every 12½. On this portion of the line a rack rail is employed similar to those on the Hartz and other mountain roads. One unfortunate feature of the road, which will seriously impair its value, is the diversity of gauges adopted. The different sections of the road have been built by different companies, and each company has its own gauge.

MR. JOSEPH M. HIRSH, the chemist who claims to have a process for extracting aluminum from common clay, has again been heard from. This time he is alleged to have confided his process to a Chicago newspaper reporter, whom he first swears to secrecy. He is quoted as saying: "I have solved the problem of extracting the metal (aluminum) from an *aqueous* solution; the process has been so simplified that it is exceedingly cheap (a few cents a pound), and requires but little labor." In the face of this statement of the simplicity and cheapness of the process, Prof. Hirsh is taking steps to receive the benefit of a very extensive backing; the Chicago Aluminum Company, which he is organizing, is to be capitalized at $1,000,000. Prof. Hirsh may have a process for manufacturing aluminum, but until he explains to the scientific world the manner in which he proposes to obtain aluminum from an "aqueous solution of common clay," he will not receive much credence among chemists, nor, it is to be hoped, much support among capitalists. We have received a long and irrelevant communication from Mr. Hirsh which in no way replies to the doubts cast upon the character of his enterprise. So far as our investigations have gone, we have no reason to modify our advice to investors that this is an excellent thing to let alone.—*Eng. and Min. Jour.*

IT is estimated that wheat and hops will bring into the State of Washington this season about $12,000,000, lumber and coal about $15,000,000, and that railway construction will bring in $20,000,000 more within 18 months. Add to this the receipts of ore, fruit and minor products of this wonderful State, and some idea of the wealth of Washington may be formed.

FALL RIVER citizens are discussing the project of erecting a large building on the lot adjoining the postoffice, to be rented to small manufacturers with power. The scheme is feasible and is meeting with much favor.

Its Mineral and Other Resources.

NUMBER XX.

[Written for the PRESS by JAMES H. CROSSMAN.]

The Silver Valley Land and Water Company—A Submerged Dam.

In a former article of this series we referred to an important enterprise that was being inaugurated for the purpose of diverting and utilizing the sub-surface water of the Mojave river, which, during the summer season, is largely absorbed by the loose, gravelly sands in its bed—the water in this stream appearing and disappearing several times until it finally disappears in what is known as the sink of the Mojave.

At the date of the writer's examination of this property, four months ago—though the scheme had been ascertained to be thoroughly practical and the organization of the company was completed—the work of development was in an embryo state, little having been done. Since that time the energetic managers and promoters of the enterprise, Messrs. Rhea and Silver, have with a large force of men excavated a long line of canal and prepared the river-bed for the commencement of their dam, which will take from two to three months to complete. The conservation or reclamation of sub-surface water by the so-called "submerged dam system," though to us new, is by no means a modern invention—it having been practiced for many hundred years in the sandy deserts of Egypt and India, and the waters used for irrigation purposes—bountiful crops being raised where before nothing could be produced. It is a well-established fact that wherever deep soils are found in a desiccated country they are wonderfully rich in the element of fertility, provided water can be procured for irrigating them. The originators and promoters of this scheme, Messrs. Silver and Rhea, are deserving of great credit, as it has now become an assured fact that the work will be speedily completed and water be running in the canal early in the coming year. It is a truism but none the less true saying that the man who makes two blades of grass grow where but one grew before is a public benefactor; and these gentlemen, assisted by their company, propose redeeming a large area of territory that is now barren and valueless.

As an enterprise of so much importance requires more than a passing comment, I will furnish a detailed description of their *modus operandi*, specifications and plans, for the benefit of your readers—there being many other localities where the same system can be advantageously used.

The Dam.

One thousand six hundred feet long from rim to rim of the river channel, has a minimum depth from water level to bedrock of 2 feet 2 inches; maximum depth, 24 feet; mean depth, 12 feet; depth from surface to the water-carrying stratum from 0 to 8 feet. The bedrock proper is composed of a micaceous granite, overlaid by from 2 to 6 feet of tough clay.

The preliminary or holding dam will be constructed of a double row of sawed piles of Oregon pine, with lap joints of the following dimensions: The lower row to be 6 by 16 inches; the upper lap row to cover joints 4 by 12 inches. Iron caps to be used in driving, if needed, end shoes if required to penetrate the formation overlying the bedrock.

After the completion of the pile dam and the water and sand are held in check, there will be built below it a solid dam of masonry composed of rock and cement. There being no rocks or bowlders in the river-bed, the piles can be easily driven to bedrock.

The Canal.

This portion of the work, which is being constructed 30 feet wide on top and 20 feet on the bottom, is designed to carry a mean depth of 5 feet of water. The bottom of the dam at its head will be 4 feet below the water level in the driest season of the year. The width of the canal at its head will be 100 feet, gradually decreasing until it reaches its normal width, thereby giving a free opening for the ingress of the water. The capacity of the canal is estimated at 18,000 miners' inches, which can be increased to 25,000 by building dikes or levees for 300 feet along its lower side. Above the head of the canal, at a proper distance, a jetty or breakwater will be constructed of sufficient strength, hight and length to divert the flow of both water and sand with proper gates to admit the water if required.

The Formation

Filling the river-bed is as follows: The water-carrying strata contains of

	Per Cent.
Water	22
Rock, average size of 4 inches	16
Rock, average size of 1½ inches	36
Sand and small gravel	26
Total	100

The grade of the river at this point is 14 feet to the mile; grade of canal, 3 feet to the mile; formation on line of canal for three miles is a stiff clay, ½-mile rock.

At the point of discharge the canal commands a 45-foot drop of its contents, which gives that much pressure head. At this point sufficient water will be taken from the canal to propel a Pelton wheel which will be used to drive motors and dynamos, as much electric-power

being generated as may be required for manufacturing, milling and other purposes, either at the point of discharge or at any other points within a radius of six or eight miles. This power can and undoubtedly will be utilized for reducing the almost inexhaustible quantities of low-grade silver ore that exists in the Calico mountain, but which cannot be profitably worked by steam, with coal costing from $9 to $10 per ton, as at present. The tufa belt alone of Calico, which is at least 3½ miles long by 200 feet wide and of unknown depth, would produce ore enough to run 100 stamps in all probability for a generation. The ore is soft, and so situated that it can be worked by quarry for a long time. It is free-milling, but low grade. There are now steadily running on Calico ores over 100 stamps, reducing 300 tons of ore daily, using steam for a motor.

The point referred to as the discharge point of the canal is in close proximity to the Waterloo mill of 75 stamps, 3½ miles from the Barbee and the Runover mills, and but a short distance from Daggett, on the line of the Atlantic & Pacific R. R., forming a suitable place for reduction or smelting works on an extensive scale, as it would command the ores of a large area of mineral country—gold, silver, copper and lead. At a point 11½ miles below the above, a reservoir site has been located having a capacity of 20,000,000,000 gallons, which can be dammed at a nominal expense and be used to irrigate an immense area of agricultural land. Dimensions of reservoir site, 3 miles long, 1½ miles wide, maximum depth, 80 feet, mean depth, 30 feet.

Such surplus water as will not be required for power purposes will be conveyed in a canal to the above-mentioned reservoir a farther distance of 10 miles. The canal for the entire distance commands a tract of irrigable agricultural land 20 miles square. The soil is deep and of wonderful fertility, only requiring water to germinate the seed. It is especially adapted to the culture of the fig and raisin grape. The dryness of the atmosphere and absence of rain during the summer months assists in curing the grape. The soil is also adapted to the growing of all semi-tropical fruits—the date palm, orange, lemon, etc. Wherever water can be obtained, six crops of alfalfa per annum can be produced. Each acre will yield from two to three tons of barley or of the other cereals.

The sweet and the Irish potato and all other vegetables do well here. Fruit matures in this region from two to six weeks earlier than in Los Angeles, and is one day nearer the Eastern markets, making a saving on freight alone of $100 per carload.

On the completion of the Utah Southern R. R., which will soon be extended to a point near Ploche, Utah coal suitable for smelting can be delivered at Barstow for $5 per ton, which will greatly assist in the opening up of a large extent of mineral-bearing country in this section of the country, most of which is now valueless, though known to be rich in minerals.

(*To be Continued.*)

THE railway mail service of the United States has during the past 2½ years been increased at a most wonderful rate. Fully 25,500 miles of new road were added. The greater amount of new routes was in the West. By attaching mail cars to the fast-limited trains all over the country a much more expeditious delivery was secured. New York and San Francisco have thus been brought a day nearer to each other,

What Constitutes an "Accident"?

The full-page engraving—"Accident in a Machine Shop," reproduced in this paper last week, was not only a pathetic picture but a very suggestive one.

Nearly every morning last week readers of the daily papers were treated to one or more railroad disasters, with a regularity that would have been monotonous had they not in every instance involved losses of life, limbs and property.

Only a few days ago a lake steamer was burned, causing the deaths of eight persons.

And these were not a tithe of the so-called "accidents" that happened during the week in the Northern States.

The question naturally arises, Is it necessary that these casualties occur so frequently, and with such regularity? We hardly believe, with the guide of our youth, that "there is no such thing as an accident"—by which he meant that all casualties are the result of human error, such as miscalculation, drunkenness, carelessness and misbehaviousness. Yet, in a large proportion of the cases reported by the press, were they all traced to their sources, one or more of these causes would be found responsible for these occurrences, as they have been for many generations past, and probably will again in years to come.

It may be that "corporations have no souls," and, consequently, no more responsibility for the lives and limbs of those intrusted to their care; but the steamboat or railroad company which confides the care of its passengers and employes to a drunken or careless engineer and fireman, is at least responsible for its own losses, and should be considered so for the losses of others whose lives and property are thus placed in jeopardy.

There should be stronger, surer safeguards thrown about the traveling public than now exist. If the corporation managers are responsible, let them be held so by the authorities, and if the subordinates have infringed the regulations made by the managers, let the proper penalties be visited upon them. The public is not supposed to know where the responsibility should lie; neither is the ambitious reporter, who generally assumes too much on the start and goes off at a half-cock, only to confuse all the after proceedings and mislead his innocent newspaper readers. But the truth should come to light and the thugs of justice be felt, let the blows fall where they will.

So in the great machine-shops of the country, from business manager to shophoy, there should be some one held responsible, directly or indirectly, for every casualty, and every disaster be traced to the guilty party, even to the outside dealer who supplies the defective belt or the fractured gear-wheel.

On the other hand, there are sometimes mysterious occurrences, usually termed "divine providences," over which human foresight and human precautions have no influence. But these instances are rare. Accidents do not often happen without a tangible cause. A man may be stricken down by lightning, and if there has been no heedless exposure of his person to the electric current, the responsibility cannot rest upon himself or any other person. But it would be very difficult to place the unfortunate in any other circumstance so utterly devoid of human responsibility as that. And if human responsibility is at fault, it should stand or fall before the influence of public opinion.—*Chicago Journal.*

Exploring the Canyons of Colorado.

Colonel Holabird, of Los Angeles, has just returned to California from an exploring expedition in the canyons of Colorado. He penetrated districts never before explored, it is said, and found in an almost inaccessible canyon 100 miles north of Williams, and near the Grand Canyon of the Colorado, the Yava Supai tribe of Indians, who had never seen any white man except John D. Lee the Mormon, who was shot for the Mountain Meadows massacre. Colonel Holabird in relating his experiences to a New York *Tribune* correspondent, said: "These Indians are of the Apache family, but of ancient origin. The men are magnificent specimens. The valley in which the tribe has lived for many years in seclusion has only two ways of approach. It contains 2000 acres and is inclosed by almost perpendicular walls 4000 feet high. We traveled over 15 miles along a canyon over a lifeless country. Suddenly we came to two boiling springs under cottonwood trees. From these springs a river starts, which winds its way through a luxuriant valley. The water in the river is as clear as crystal and so strongly impregnated with lime that it petrifies everything it touches. There are three immense cataracts in the canyon. These look as if centuries ago a huge cottonwood tree had fallen across the stream and lodged. Mosses, ferns and creepers formed a barrier; all these turned to limestone. The grass caused the deposit to increase until the barricade extends across the canyon making a fall of 250 feet. Along the front of these high cataracts limestone ridges have formed 20 to 50 feet one above the other. Over all these the water falls like a sheet of glass. Underneath, between the ridges, thousands of plants with flowers in full bloom are seen, while millions of humming birds dart in and out. The chief of the strange tribe is an old man of 60, 'Captain Tom.' The name was given him by John D. Lee. I found these Indians in a starving condition, subsisting on berries and grass seed. I appealed to the Government for them, but the Indian Department said it couldn't help wandering people." General Miles, who says he has heard of these Indians, but could never get a guide to their canyon, will investigate their condition.—*Phila. Public Ledger.*

PRIESTS AND POLITICS IN JAPAN.—The position to be taken by the priests of the various Buddhist sects in Japanese politics, and especially during the first general election, has been a matter of much interest, in view of the widespread influence, the energy, activity, and occasionally exceptional ability, of members of the Buddhist priesthood. When the text of the constitution was under consideration the famous Monto sect sent delegates to Tokio to urge the authorities to allow their Order the right to elect and be elected to the House of Representatives. A politico-religious association known by the high-sounding title of "Sovereign-reverling and Buddha-believing Grand Combination," which has recently been established, is supposed to be mainly composed of priests. However this may be, the chiefs of all the Buddhist sects lately met in one of the principal temples of Tokio to discuss the subject of the priests' duties in regard to current practical politics and to lay down certain rules for their guidance. The result of the conference was a series of resolutions to the effect that no priest should be permitted to join a political party, that a priest should under no circumstances whatever be allowed to labor for a political party, and that every priest should be enjoined to warn his flock against the danger of allowing political differences to interfere with social intercourse, and against breaking the law through political zeal; and that under no circumstances shall either the principal hall of a temple or any other sacred building be lent for the purpose of holding political meetings or delivering speeches connected with political parties. These resolutions, with appropriate instructions, have been circulated by order of the head of each sect to every Buddhist priest in the country.

What Invention Does.

The great perfection attained in cotton manufacture and its wonderful development within the past century, are due to the inventive skill and untiring energy of the mechanicians of this country. In 1793 the saw cotton-gin was invented by Eli Whitney, a citizen of Georgia, and the importance of this invention to the cotton manufacture cannot be overestimated, for it was the one thing needed to insure a sufficient supply of the raw material to meet the requirements of the increasing machinery for spinning and weaving. The result of Whitney's invention was the rapid extension of the culture of cotton and its permanent establishment as one of the leading staples of the country. Previous to the introduction of the "saw-gin," lint cotton had been separated from its seed by the use of what were known as "roller-gins." The process was almost identical with that in use in India centuries ago, and was slow and expensive, whereas the new gin separated lint from seed in much less time and at much less cost than had been done by the old plan; as it also increased the quality of lint made from "seed cotton," it is easy to see how this invention greatly enhanced the planters' profits, and thus gave a great stimulus to cotton-planting. The first establishment of which special mention should be made was that of Samuel Slater, whose centennial has just been celebrated, who made with his own hands a series of Arkwright machines and started at Pawtucket, R. I., a cotton-spinning factory. Taking the waterwheel of an old fulling-mill, he used it to give power to three carding, one drawing and roving machine, and 72 spindles. As the cotton of the Southern States was then badly cleaned, his supply was drawn from the West Indies, and in 1794 he made the first cotton thread, and from the small amount of 500 bales consumed in 1800 the industry now finds employment for over 200,000 persons and uses over 2,000,000 bales of cotton.—*St. Louis Dry Goods Reporter.*

GLASS HOUSES AT SAN GABRIEL FOR THE PROTECTION OF VEDALIA CARDINALIS THROUGH THE WINTER.

MR. W. BARNET LE VAN has for years been laboring at a system of pneumatic propulsion for passengers as well as for freight. London has a pneumatic freight line which carries a car five miles in seven minutes, and Mr. Le Van is assured that the darkness is the only unpleasant feature of the trip. He anticipates that within a few decades a pneumatic tube line will carry passengers from Philadelphia to New York in 20 minutes. In fuel and other respects he looks for a large saving. Mr. Le Van concisely explains his plan, and such a plan may be possible; but as Macaulay well says: "Any statement, not involving a contradiction in terms, *may* be true." The world has grown as weary of air-navigation schemes as of alchemy. Every new project dwells on the fact that ideas once ridiculed have found universal acceptance and ignores the corresponding fact that ideas once popular have failed to stand the test of time. With two of Mr. Le Van's statements, however, we express our fullest concurrence: "Some objections may be raised to underground roads of this kind. For instance, persons of a nervous temperament would probably be timid about trusting themselves in the cars at first."

THE Director of the Mint has promptly explained in his letter what the Mint has done in answer to the complaining stockholders of the Comstock. Undoubtedly these gentlemen will, in due time, give their view of the case and state the reasons they have for considering as unsatisfactory the investigation of the Carson Mint, referred to by Director Leech; and if they can show good cause for asking it, we have not the slightest doubt the Director of the Mint will do anything that may be necessary to keep the management of any and all of the local mints above the reach of suspicion.

ANOTHER English syndicate has scooped up more important industries in this country. The new company is known as the American Stove and Furnace Company, and have secured control of the Magee Furnace Company of Chelsea, Mass., the Smith & Anthony Stove Co., and other small concerns and mills to consolidate them. They have a capital of nearly $2,000,000.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—*Ledger*, Nov. 15: Everything about the Wildman mine is looking fine. The new addition to the mill was started yesterday, making 30 stamps in all. The entire mill is in first-class order and runs well. The rock-crusher is in position directly at the landing. The ore goes through the crusher and into the large ore-bin and is taken out through gates and run into a car which runs on a track laid on the ground to the mill, a distance of 30 feet, where there is an elevator which takes the ore up to the level of the hoppers, a distance of 22 feet. Directly at the top there is a turntable, which facilitates turning the car in the direction of the mill. The power for running this elevator is furnished by means of water in an inch gas pipe. The amount of water used is almost unnoticeable, and raises the ore to the top in the short space of 15 seconds. This is Mr. Tregloan's idea, and is considered an excellent plan. At the Rose mine they are still running east, in the hope of crosscutting something, but there is nothing encouraging in sight as yet. They think, however, that they must strike something very shortly, otherwise there is very little hope of success. The Sutter Creek mine is still forging ahead. The new ten-stamp mill is running and everything in and about the mine and mill looks very prosperous. They are milling ore from a ledge 20 feet thick in the stopes, and have 11 men on the pay-roll. At the North Star, crosscutting still goes on. They are in a considerable distance east and west, but there is nothing in sight as yet. The Lincoln mill, after a rest of two or three weeks to enable them to enlarge the ditch, etc., started up again last week and will likely run steadily all winter.

A RICH STRIKE.—About a week ago George Morgan put some men to work on a quartz claim owned by him on the south slope of Duncan Hill, a little more than a mile west of Auburn and not more than 100 yards from the famous Moore mine. Last Wednesday they struck some fabulously rich rock and took out that day what is estimated at from $1000 to $1400.

Calaveras.

WEST POINT.—*Chronicle*, Nov. 15: The mines are all running steady and are doing better than ever. Mr. Watkins has got his new machinery up and is sinking his new shaft on the Smith ground. I believe he will have a good mine. Billy Cook and Will Elliot have been taking out some very rich rock from their claim near the Peasley mine. It is in a good section and I predict there is a chance for them to take out a barrel of money.

ABOUT MURPHYS.—Quartz and gravel mining is looking up in the Murphys mining district. Considerable prospecting is being done, and in many instances the results are excellent. The last cleanup at the Union Shaft mine on Central Hill amounted to over $2000. Operations have ceased in the Sheep Ranch mine pending the overhauling of the mill.

El Dorado.

A MILL TO GO UP.—Georgetown *Gazette*, Nov. 13: The Van mine, a half mile north of town, which has been thoroughly prospected during the past summer by Thos. Newlands, is about to be worked on a more extensive scale. A force of men came up Saturday to begin the work of putting up a mill and sinking on the lode. The lode is about 20 feet in width and has been uncovered for several hundred feet. The ore is a soft material and prospects well in free gold. We are well pleased to learn that the management is in practical hands.

Inyo.

AN INYO DIVIDEND.—*Index*, Nov. 10: At a meeting of the Board of Directors of the Newtown Mining Co. held in Carson City, Nevada, Oct. 29, 1890, a dividend (No. 1) of five cents per share, aggregating $5000, was declared, payable immediately. This is the company which is working the Dunphy and Keefe mine at Cerro Gordo, and indications are very favorable for a long series of regular dividends.

MODOC CON. CO.—Since work was resumed have shipped two carloads of ore; 1st carload, $1990, 2d carload, $2274. The ore keeps improving, last returns being $7.40 gold, 169 ozs silver and 51 per cent lead. Twenty-three men are employed at an average of $3.50 per day. Have quite a body of pure galena in the Confidence mine, 18 inches wide, averaging 247 ounces silver per ton and 80 per cent lead. Will ship one carload of this ore on Nov. 5.

SYLVANIA DISTRICT.—*Register*, Nov. 16: Work in the Liberal tunnel in the hill northwest from the Liberal shaft has been suspended, and the two shifts in the Climax have been put on ten-hour shifts. Drifting in the Liberal shaft is being vigorously prosecuted. It is the intention soon to resume sinking this shaft and continue it down to a depth of 300 feet. Messrs. Ramez and Thourot, owners of the International mine, located east of the Liberal, have been working it during the summer and fall, and have a shaft down 85 feet, doing their hoisting with a windlass. They have a fine-looking prospect in the mine, and now have about ten tons of clean, closely-sorted ore sacked ready for shipment, which they will send to Salt Lake for reduction. Shoemaker and Hession have just finished burning five large coal-pits, containing some 10,000 bushels of coal. This coal was burned on the word of the local managing agent, but as there will be no immediate use for it here the owners are talking of hauling it to Owens Valley. Kinkead has suspended work on Carbonate hill for the winter. During the sunshine hours we are favored with summer-like weather, but the nights are freezing cold. This place has an altitude 400 or 500 feet higher than Bodie, but being so far from the Sierras it is not so cold here as there. The elevation of the bed of Sylvania canyon at the point where the California-Nevada boundary line crosses it is 8760 feet. The rains of three or four weeks ago and the cool weather have caused an increase of water in the springs and wells, filling the latter nearly to the top.

Nevada.

THE HYDRAULIC MINES.—*Tidings*, Nov. 12: Hustler & Sons of Chimney Hill in Bridgeport townsbip are building a dam in South Shady creek, and when it is completed, about two weeks hence, will resume hydraulicking in their claim there. The Eureka Lake & Yuba Canal Co. are building a dam in Spring creek and expect to have it finished in a month, when they will start up the Columbia Hill mine. Both of them are rich. The dams are being built in a solid manner and so that there will be no overflow. A sunken shaft inside the reservoir, the top of which is near the surface, will carry off the surplus water. The work on the dams is being supervised by agents of the Anti-Debris Association and they express satisfaction with the durability and utility of the structures.

COE MINE.—The Coe mine has been pumped out to the bottom (500 feet) and has been repaired wherever found necessary, and is now being cleared of the debris that has accumulated at the bottom. All the upper levels are in good shape for working, and the 500 level will be as soon as the dirt is cleared away. This level has never been opened to any great distance.

PROSPECTING FOR GRAVEL.—Prospecting on the Washington ridge promises to be very lively the coming year. Of course all the companies will not strike it. Prospecting is a gamble, but if two or three mines are struck it will more than compensate for the outlay that will be made hunting for others that failed.

IDAHO.—The new ledge in the Idaho shaft is 18 inches in width and shows gold freely, and is "holding its own." Milling tests have been very satisfactory.

NEVADA CITY MINE.—*Transcript*, Nov. 15: Superintendent Shoecraft is proceeding finely with developments at the Nevada City mine. Twenty-four men are working on tribute and wages. At the 300-foot level two crosscuts are being run, one for the overhanging ledge and one for the footwall. A rich ore body is liable to be encountered at any time. The work of remodeling the mill is going along well. Wood's Ravine is a very lively camp now, and promises to be still more so.

RICH ROCK.—The rock from the Cement hill ledge owned by Geo. Fletcher and John Skewes paid $20 per ton in gold instead of $13, as published by a contemporary. The sulphurets are very rich.

Shasta.

IRON ORE.—*Courier*, Nov. 15: Recently the owners of Iron Mountain mine sent to the San Francisco Iron Rolling Mills two carloads of iron ore from Iron Mountain, famed for its deep silver and gold deposits and the valuable working of the same. The two carloads were reduced by a process known to the establishment mentioned, and the result was the turning out of ingots of steel of the finest quality yet produced from any ore on the Pacific Coast. The superintendent of the San Francisco works, on seeing the result of the reduction alluded to, telegraphed to send down three additional carloads, and the ore is being hauled through town to the cars. It is among the strong probabilities that out of the hills and bowels of old Shasta county may yet come the material for the steel plates that will armor ships to carry the Stars and Stripes in dignity and security on every ocean and sea of the world.

PROMISING QUARTZ MINE.—The Eiler Brothers have a quartz mine on White Rock creek mountain, that ought to possess strong attractions to capitalists. The main ledge is three feet wide, and has been shafted 170 feet from surface and is as good at bottom as top. Tunnels tap it low down in several places, and upraises show the uniform quality of the ore, which goes from $18 to $30 per ton without sampling. Several ledges, showing good paying ore, run parallel to the main ledge. This mine is at such an elevation that there will be no trouble of working it by interference of water.

SOUTH FORK.—It is expected that work will soon be resumed at the Chicago, an expert having been up to report for a new company and he seemed well pleased with the outlook. A hoarding-house for the men is built at the Gem Mine. Robinson & Co. are getting some good ore from their Black Prince. They are also rebuilding their arastra to work some rich gold ore found on the South Chicago. Hubbard & Castle are building an arastra a short distance above the Chicago mill. They are going to run it on their Cold Spring ore. Shirland & Bro. are running their arastra on Atlantic and Little Giant ore. E. L. Ballou's arastra is running on ore from his Hope. Litten & Moody have their arastra completed and running on Continental ore. The Eubanks boys have their arastra about completed. At Muletown Doc. Dunham has his shaft down about 80 feet, and intends to drift at 100. He is getting some fine ore. Whit George is also getting some fine ore from the drift on his ledge. There is sufficient water for power, and the quartz-miners wouldn't object if this fine weather lasted all winter.

Sierra.

STARTED UP.—*Mountain Messenger*, Nov. 15: The machinery of the Mountain mine near Sierra City, owned by an English company and managed by George W. Pinnie, was started Saturday. The 40-stamp mill and the cable tramway worked to perfection. Should the mine prove good, it will give a great impetus to other mining developments which have long lain dormant for want of capital.

Trinity.

EAST FORK.—*Journal*, Nov. 15: All the mines are running in full blast. The North Star Co. have started a new tunnel to tap the lode at a greater depth. The prospects are very flattering and no doubt as soon as tapped a large body of ore will be opened up. The Enterprise Co. have struck the ledge on the Lone Jack mine and are running levels north and south; the rock increases in richness with depth attained, and they have at present ore enough in sight to keep the mill busy for a long time to come. The Lone Jack is supposed to be an extension to the North Star lode, and if so, it proves the North Star to be a valuable piece of mining property outside of its old discovered lodes. The Yellowstone is running a full crew and report says on very rich rock and every indication of plenty of it.

NEVADA.

Humboldt District.

THE GYPSUM BEDS. — *Silver State*, Nov. 15: The owners of the gypsum deposit east of town have commenced operations and are building roads and opening the mine. A contract to haul 1000 tons of gypsum to the station has been let to George Ladd. This deposit is reputed to be the best and largest in the United States.

LOOKING AT NICKEL MINES. — Lieutenant Buckingham of the United States Navy was here a short time ago in behalf of Uncle Sam, looking at nickel mines in this vicinity. Some very fine mines of this metal are located near here. One belonging to Mr. Bell at Cottonwood and one to Mr. Lovelock at the same place, were examined by the officer. It is hoped that Uncle Sam will find what he is looking after in this vicinity, as I believe there is an appropriation of a quarter million dollars by the Government to invest in nickel to be used in the armament of vessels, and if that much or a portion of it was used in this county for the purpose named it would make times lively. John O'Kane and John Ryan have a fine nickel prospect a short distance east of town.

SILVER MINES.—Col. Cessna of Ohio has bonded of A. Scidmore the Arahia mines, formerly the property of George Lovelock. The Morning Star mine in Trinity district is being worked by a force of eight or ten men. The mill has been moved from Oreana up in the canyon near the mine and is now about ready to start up.

LONG RUN.—The Spring Valley mill has just completed a long and, as near as can be ascertained, a successful run. The mills are now shut down for a short time. The best ledge of ore in the State is reported to be in this mine, which is owned by the Humboldt M. & M. Co.

Washoe District.

WEEKLY BULLION YIELD.—*Territorial Enterprise*, Nov. 16: The following table is arranged from the weekly reports of the mining superintendents and represents the number of tons of ore crushed the past week, value per ton according to battery samples, and totals:

Mine.	Tons.	Value.	Total.
Con. Cal. & Va.	1,575	$17.41	$27,420
Alta	315	18 00*	5,670
Yellow Jacket	540	18.00*	9 828
Crown Point	391	14.91	5 829
Overman	329	21.18	6,968
Savage	835	20.46	17,054
Chollar	533	19.24	10 254
Belcher	271	18.75	5,081
Occidental	295	20.10	5,929
Totals	5,090		$84,033

*Estimated. The report of the work of the Justice not at hand for the past week. It would add nearly $5000 to the result.

CON. CAL. & VA.—1200 level: Continue the extraction of some milling ore along the line of the north drift. 1300 level: Ore of a fair quality is still being extracted from the junction with the upraise. 1500 level: Extracting some ore in drifting northeasterly from the junction with the upraise 260 feet north from the Con. Va. shaft. 1600 level: Have continued to extract ore along and above the line of drift run east through the old stopes on the sill floor of this level. We are also working southerly from this drift stoping out ore. 1650 level: From the various openings we continue the extraction of ore of the usual quality and quantity. 1750 level: The southwest drift from the main west drift has been extended to 277 feet, showing quartz of low assay value. There has been extracted during the week from all parts of the mine 1611 tons of ore, which was shipped to the Eureka mill.

OPHIR.—West drift, 1300 level, is extended 25 feet in low-grade quartz; total length, 76 feet.

SIERRA NEVADA.—The southwest drift started on the 630 level has been advanced 41 feet in a soft porphyry formation, showing some seepage of water.

UNION CON.—East crosscut No. 2 from the north lateral drift, 1465 level, extended 27 feet, total, 237 feet; continuing in soft porphyry formation.

MEXICAN.—On the 1465 level an east crosscut No. 1 has been started and advanced 18 feet in a soft porphyry formation.

UTAH.—725 level: The main south drift has been extended 16 feet; total length, 783 feet. Formation, soft porphyry showing some clay.

Blind Mountain District.

MIDNIGHT CLAIM.—Pioche *Record*, Nov. 13: Jimmy Clark came in from Blind Mountain district last Thursday to stay a few days. He and Freddie Burrows are the only persons living in the district. They are working on the Midnight claim, and have been for nearly two years past. They have recently finished a 300-foot tunnel, which taps the working shaft on the Midnight and greatly facilitates the working of the claim. The ore veins so far found in the district are small, but very rich, and the Midnight is one of the most promising claims there and the general belief of those who know it is that it will eventually develop into a rich mine. About four tons of rich ore were lately shipped from the old Buckeye mine, near Ophir canyon, Smoky valley, to the West Sampling Works.

Cortez District.

A SATISFACTORY TEST.—Reese River *Reveille*, Nov. 14: The test which was made on ore from the Cortez mines with the O'Hara furnace at Mill City has proved satisfactory, the chloridizations working up to 93 per cent. The Cortez company have decided to erect one of these furnaces at their mines in Lander county.

FOR CHERRY CREEK.—Three big freight teams left Nelson's ranch near Stone House a few days ago, loaded with barley and a supply of hay for Hamilton, White Pine county, where they load the machinery for a 12-stamp mill to remove it to Cherry Creek, 90 miles south of Wells. The *Central Nevadan* says the Nelson Bros., of Stone House, are interested with a gentleman named Ellsworth in the Cherry Creek mines, which, until lately, have been in litigation. There is enough ore on the dumps of a high grade, it is stated, to justify the expenditure of $50,000. Ten thousand dollars have been expended in the last two years in lawsuits over the property. Four trips of these large teams will be necessary to transfer the mill to the plant, which will not be accomplished until the first of the year.

Campbell District.

CLIPPER HILL.—*Territorial Enterprise*, Nov. 15: Richard Streahley is reported to have a fine body of ore in his mine on Clipper hill, Campbell district. The claim is valued at $25,000. The Cortez Mining Co. has taken charge of the Clipper and is intending to soon put a force of men to work. The mines in Morey are looking well and good silver ore is being hoisted to the surface constantly. The Morning Star mine, Pittsburg, Lander county, has closed for the winter. Next spring the company will begin the extraction of ore and the building of a mill in Lewis canyon.

THE HOLMES MINE.—Walker Lake *Bulletin*, Nov. 12: For the week ending November 1, the Holmes mine at Candelaria had 228 tons of ore milled at the Belleville mill. Average assay value of the battery samples, $30.92 per ton. The superintendent writes: "We are taking out some ore from the Creole ledge on the east side of Pick Handle gulch, which assays 29 ounces of silver per ton." This new strike is very near the old Belding ground.

Candelaria District.

MT. DIABLO.—Walker Lake *Bulletin*, Nov. 15: The mine was shut down Tuesday on account of the State election and was not started up for two or three days, as we had some repairs to make to the engine. There is no special change to report from the mine during the week. On the sixth level the east drift gives a small amount of $50 ore. The main stope between the fifth and sixth levels shows three feet of $40 ore. The north crosscut from the east drift on the fifth level shows 18 inches of $60 ore in the upraise, and a small amount of $40 rock comes from the west drift, same level. The west intermediate between the first and second levels is giving a small amount of $40 ore. The west drift in the Mt. Diablo adit shows small bunches of $30 ore in the face. The mill has been running steadily during the week and doing good work.

HOLMES.—Have resumed the extraction of ore in all the levels down to the new twelfth, averaging from $29 to $55 per ton. Will commence stoping on the ore body cut in the Sutherland tunnel during the week. In the old Creole tunnel we are taking out some ore from this section of the mine assaying about $30 per ton. We are working 8t men and taking out about 55 tons of ore per day. No ore crushed at either mill during the week. Candelaria mill now crushing Holmes ore, with fair prospect of a good month's run. Bullion shipped, about 7000 ounces.

ARIZONA.

NOTES.—Prescott *Courier*, Nov. 15: Turkey Creek miners have considerable rich ore to ship. Owners of the Zero, a Hassayampa mine, are taking out rich ore. Cherry Creek miners are doing well with arastras. The Boggs and Hackberry mines, in Big Bug district, have produced great piles of ore, which will soon be worked. The new Senator mill will soon be ready for work. United Verde is shipping carloads of copper-silver hullion. Tip Top miners continue to get good results from ore shipped to El Paso. Del Pasco mill was to have started on another run Monday last. S. C. Mott has 50 or 60 men employed at his mines and mill. He will make another large shipment of silver in a few days.

GRAHAM COUNTY.—Tucson *Star*, Nov. 15: Joseph Smith, who owns some mining property in Aravaipa canyon, Graham county, arrived in this city this morning and reports matters there in a prosperous condition. The ore produced by the mines there is galena and silver and assays about 40 per cent lead and about 82 ounces silver. The New York Company are operating 32 prospects, most of which show well-defined ledges or true fissure leads.

FIRE.—*Arizona Silver Belt*, Nov. 15: A fire occurred at the Old Dominion Copper Co.'s works Sunday morning, Nov. 2d, at half-past 3 o'clock, which for a short time threatened the destruction of the hoisting works. The chief loss to the company was the tools destroyed. No interruption of mining will be caused.

HACKBERRY PROGRESS.—Prescott *Courier*, Nov. 8: Mr. J. J. Williams, superintendent of the Boggs, Hackberry and other mines, is having a narrow-gauge railroad constructed from mine to mine. It will run by the smelter, which is to be on Big Bug creek.

RESIGNED.—J. F. Blandy, Territorial Geologist, has resigned his position. He cannot afford to give the necessary time to the duties of that office for the small salary of $1500 per year.

KINGMAN DISTRICT.—*Mohave Co. Miner*, Nov. 8: Mr. W. A. Farish has 12 men at work on the Union mine taking out good ore and shipping to El Paso; he will put a few more miners to work this week. Work on the Phœnix mine is progressing favorably and the mill is running steadily on good ore.

BRITISH COLUMBIA.

GENERAL MINING NEWS.—Nelson *Miner*, Nov. 12: Now that snow covers the mountains, making it impossible for the prospector to follow his calling with any degree of comfort or profit, many who follow that pursuit are coming in in search of employment for the winter. Neither the camp at Ainsworth nor the one at Nelson has reached the stage of development requiring a large number of men to carry on the work. Less than 100 men are now employed at mining in the two camps, and the number is not likely to be increased during the winter. Prospectors who are practical miners, therefore, stand but a poor show of obtaining employment at their trade in the lake country. While they can put in the winter as cheaply in either Ainsworth or Nelson, as far as actual living expenses go, as in any of the towns in mining districts in Montana or Idaho, but few of them have the means to do so. They are men who work in the winter to earn money to defray their expenses while prospecting in the summer. In Toad Mountain district everything, in a measure, depended on the Hall mines. It was hoped that they would give employment to at least 100 miners during the winter. But these hopes will not be realized. This setback is due entirely to a gang of ringsters at Victoria jumping the property—a gang who do all their prospecting for mineral in the offices of mining recorders. While their chances are slim for obtaining possession of the Silver King and Kootenay Bonanza, their dirty work has prevented the original locators and owners of the mine from taking any progressive steps toward the development of the property. At present three shifts are at work on the Silver King tunnel, which is in nearly 300 feet. About 150 feet are still to be run, and the work is progressing at the rate of 12 to 13 feet a week. On the Dandy a shaft is being sunk; but water is said to interfere with the work. On Eagle and 49 creeks some little work is being done by owners of claims. A 2-ton sample shipment of ore from the Whitewater, a Rover creek claim, was made to the Revelstoke smelter during the week.

COLORADO.

EAGLE COUNTY.—Denver *M. & S. Review*, Nov. 15: Some specimens of very rich ore were brought in this week from the Kentuck Boy, on Taylor hill. The ore is a hard carbonate coming from a fissure in the lime; it is heavily impregnated with gold, and the surface of the ore shows free gold in large quantities.

CLEAR CREEK COUNTY.—Over in the Lamartine district everything is life and activity. The Lamartine, Pulitzer, St. Louis and Harrison are all working good forces of men, and an immense amount of ore is being taken out. Lamartine is bound to be one of the best camps in the county.

LAKE CITY'S FUTURE.—Hinsdale *Phonograph*, Nov. 15: With silver and lead at fair prices in 1892, Lake City will be the heaviest shipping camp in Colorado, and the most prospernus mining camp in America. Mark the assertioo. An important strike was made on the Paris the fore part nf the week. In driving the 5th level a large chamber or cave was opened up that extended downward to an unexplored depth. The chamber contains hundreds of tons of excellent ore for over 30 feet in width. Mr. Pray informs us that in two weeks he expects to double the present facilities of hauling and will sbip two cars per day instead of one.

SAN JUAN COUNTY.—Silverton *Miner*, Nov. 15: The most important mining item of the week has been the big strike on the 2d level of the Congress mine. We are informed that the ore body has been exposed for a distance of 20 feet long and 8 feet in width, and there is no sign of a wall on either hand. The ore is black copper and there is not 15 per cent waste in the entire mass.

IDAHO.

GOOD ORE.—*World*, Nov. 11: The Washington Co. made a cleanup the other day. The ore went $22 per ton, and was not assorted. The ledge ran seven feet in width, and was allput through the mill.

NEW MILL.—The most of the machinery for the Ciunabar Mining Co.'s new 10-stamp mill was delivered in Clayton, Fridav, by one of H. C. Lewis' large freighting outfits. Mr. J. Phillippi will take it from here to the mine. He started with a load Saturday.

WAR EAGLE MOUNTAIN.—*Avalanche*, Nov. 8: Robert Sothern, owner of the Dernier Resort claim on War Eagle mountain, has struck a fine body of ore in the tunnel he has been running on the vein. The tunnel is in some 300 feet and has been for a long distance in ore prospecting about $20 a ton, but has now reached a chimney, which parties who have seen it report to be "away up." The ledge is four feet wide with well-defined walls. The Chautauqua mine, one of the Lepley group at Wagontown, is showing good ore in both the north and south drifts, the pay streak heing about 15 inches wide in eacb place. The main crosscut tunnel now being driven by Wells, Barker & Co., is expected to soon cut a ledge. It is in hard rock and is working the boys pretty bard. Steve McElmeel and Gilbert Mickelson have cleaned out the tunnel on their mine on War Eagle mountain, built a new house, and laid in a supply of grub for a winter's campaign. Al. Stevens will soon sink a shaft on a newly acquired claim on Lewis' Gulcb, with excellent prospects of making the mine a productive one. The prospects of the Bshy mine bave materially improved during tbe week, and a large output is confidently looked for in the future. The Injector, owned by Geo. W. Stoddard, is showing up well as development work progresses.

MEXICO.

COAL FIELDS.—*Star*, Oct. 20: A promising coal strike has been made at San Marcial in the State of Sonora, Mexico. Lately the diamond drill while at work on the extensive grant of the Mexican Coal Co., at the depth of 80 teet struck a vein of antbracite coal. The auger had penetrated six feet, when some of the diamonds became loose and drilling was stopped without having passed through tbe seam. The seekers after coal had foolisbly kept following tbe broken remnants of the coal measures in the wild volcanic regions of La Barranca, San Xavier and Tarumary, where Alsua & Graff had made discoveries. In 1881 Mr. J. M. Ainsa visited the country and he saw with a calculating eye, after examining tbe formations at the Alsua & Graff mines and the ground from there west to San Marcial, that tbe whole country for 70 miles square was once one vast coal deposit that volcanic eruptions had broken up, as shown by the mountain ranges that cross the country at intervals, and be rectified his tbeories by the outcroppings of coal found about the base of every mountain range in that locality. The Topeka engineers, including Mr. Gardiner, bave examined these fields and pronounced them worthless; other scientific men who came were puzzled by the formations and declared they did not know wbat to say; they bad never seen the like in tbeir life nor read about it. In tbe midst of their many disappointments tbe Anisas and Garcias still kept up their belief undiminisbed, and for a last result they levied an assessment and started to bore and show to the great coal sharps of the United States and Europe that their theories were at fault. They bored and have struck under the valley the true carboniferous coal measures. On the surface, at a place called La Penitas, the coal measures are thrown up and spread like a map upon the ground and there appear 37 coal seams varying from one foot to 14 feet in thickness. It is not long but the diamond drill will demonstrate whether these veins are to be found at the bottom of the San Marcial valley, and if sucb turns out to be the fact Sonora will have the honor of containing in its bosom tbe greatest coal deposits in tbe world.

MONTANA.

BUTTE ITEMS.—*Inter-Mountain*, Nov. 15: Success seems to attend every effort of tbe Butte & Boston Co., and tbe mere fact of their baving purchased a property seems to be sufficient to have it turn out a bonanza. The new concentrator that is being built by this company is so near completion tbat the machinery is being tested daily. When completed this concentrator will have a daily capacity of 400 tons and will be the largest of its kind in the camp. It will be a great addition to the producing power of tbe Butte & Boston and to that of the camp as well.

A GOOD SHOWING.—There has evidently been no falling off in the prosperity of the Drumlummon mine during the past month. The official report of the Montana Co. shows the net profits of that property during that time have been 531,600, which is not a bad showing on a total output of $87,000. The official figures are as follows: The 50-stamp mill crushed 3800 tons worth $47,700; the 10-stamp mill crushed 583 tons worth $20,700; the 60-stamp mill crushed 2900 tons worth $18,000. This makes a total of 7273 tons of ore treated, turning out $87,000 in cash. The working expenses for the same time were $55,400, leaving a profit of $31,600 to the credit of the company.

OTHER MINES.—The Quilp mine has reached the 200 and sinking continues to the 300. A. A. McDonald and others, who recently purchased the Jersey Blue, are about to locate a new shaft and commence work upon it. Leggat and Palmer, who recently purchased the Sullivan mines at the head of Boulder, about one mile north of Granite, are sending in men and supplies to commence work on that group.

NEW MEXICO.

RICH MINES ON THE NAVAJO RESERVATION.—*Southwest Sentinel*, Nov. 11: Cen. E. A. Carr, who has been on a hunting expedition, returned on Friday. He visited the Carrizo mountains, and good authority says tbat he found plenty of rich ore—in fact, some of the richest ever found in North America—and that he will recommend that that portion of the Navajo Indian reservation be thrown open to the public.

ACTIVE WORK IN PROSPECT.—Rio Grande *Republican*, Nov. 15: Prof. Carrera has acquired an interest in the Huston & Thomas lead mines on the western slope of Pinos Altos mountains. The professor has started work on the claims, and within ten days will have 15 or 20 teams bauling ore to the railroad at tbis place. The ore vein crops out for a distance of over 300 feet and shows an ore body of 14 feet in thickness. It is one of the largest ore chutes ever found in the West showing such a large body of ore on the surface. At tbe present prices of lead and silver, it will surely return large profits. These mines are named the Alpha and the Omega.

OREGON.

BIG DITCH.—*Union*, Nov. 15: Tbis ditcb, 27 miles of which will be completed in a few days, will be an average of five feet at tbe top, three feet at tbe bottom and two feet deep. The water will be taken out of the East Umpqua river and led over Myrtle creek. The compauy bas ordered 200 feet of 15-inch hydraulic pipe and two giants of 1000 pounds each. Tbey propose to work the mines this winter with both giants. Tbey have now 50 men employed in the construction of tbe ditcb, and it is expected to begin mining by Christmas. These mines have been worked for years, but owing to a lack of water tbey have not been as profitable to the owners as desired, thougb they bave paid wages. When they get a sufficient amount of water, wbich tbis ditch will furnish, tbese mines will doubtless pay richly for tbe increased cost of working. The gold is in the ground beyond a doubt, and when they are worked by the bydraulic process, can't fail to pay large dividends. The company bas not gone blindly to work in tbis matter as a prospecting venture. Tbey have thouroughly prospected the ground and find tbat the auriferous deposits are extensive and of a bigb grade. The company of which Dr. L. W. Brown of Eugene is president, is organized witb a capital of 25,000 sbares, at $25 a share, par value, quite a large amount baving already been taken. Louis Catching, an old miner in tbat section, has tbe coutract for the work on the ditch, and his claim, from wbich, in a primitive manner, $900 was cleared up in nine weeks' run, has been purchased by tbe company. The company now controls 2080 acres, most of wbicb will do to mine and cannot be worked out for years to come. If the diggings are anywbere near as rich as the prospects indicate, or as tbe ground already worked bas been, it will be a bonanza to the fortunate owners.

TO PROSPECT BLUE GRAVEL.—Ashland *Tidings*, Nov. 14: Last year eight Ashland men located claims in the blue gravel region, near Henley, Cal. Tbey associated tbemselves together under the name of the El Dorado Blue Gravel M. Co., and did some prospecting last fall. Tbe first point to be determined was to ascertain wbether tbe blue gravel deposit actually underlies their claims. To get at this at a minimum cost, a contract was given to Dodge & Williams to drill a well to tbe depth of 200 feet or less. Tbe work was begun, but owing to difficulties in operating tbe drills, tbe bole was not sunk to the depth desired. Tbe company now purposes to begin prospecting work again, and concluded a few days ago to admit some other men to an interest in the venture. For tbat purpose a prospecting copartnership is to be formed and sbares disposed of to those wbo want tbem, up to a certain amount. The number of shares is placed at 150, par value $20, and the purcbase of one share gives the purcbaser a 150th interest in tbe property. It is the purpose of the company to first determine that the claims cover the blue gravel, and in so doing, if the result be favorable, to then incorporate and begin prospecting for what the blue gravel is supposed to contain. Wednesday morning a committee of the company, Messrs. Roper, Burriss and Phillips, went over to Henley to look over the ground and report upon tbe best method of prospecting. They intended to visit all tbe mines that have been opened on the blue gravel lead, and will probably return home this evening.

PUTTING IN SMELTERS. — Union *Republican*, Nov. 12: The Oregon G. M. Co. of Cornucopia has at last got down to business. Their large 20-stamp mill is kept running night and day. For several days teams have been hauling brick from this city to be used in erecting smelters at Cornucopia for this company. The result of the work is beginning to be seen. A party came down yesterday and deposited a large amount of bullion in the First National Bank.

RICH SILVER ORE.—*Statesman*, Nov. 13: The best silver ore ever brought to Walla Walla is that recently received by J. C. Swash from a ledge he and other Walla Walla men are interested in over in Baker county. In silver, some of the samples are equal to any tbat ever came out of the Comstock. It is black sulphuret ore containing ruby, brittle and antimonial silver, witb indications of cbloride, The ore is very lively looking and has every appearance of coming from a good solid ledge, whicb is said to be fully four feet wide. The specimens shown us came from a depth of 80 feet. We hope it will turn out a bonanza for all the owners, and that they will show their enterprise in Walla Walla by erecting a fine hotel a la Tabor when they make a few big cleanups.

SAMPLING WORKS.—A reduction plant, such as is proposed by the Baker City Oil Concentration & Sampling works, cannot help but be a great benefit in the development of the mining resources of Baker, Union and Grant counties. It will give the mine-owner a ready sale for his ore at the company's works and enable him to place his property in a shape for remunerative disposal if he so chooses.

SOUTH DAKOTA.

CALEDONIA GOLD M. CO.—Deadwood *Pioneer*, Nov. 14: There are three direct vertical fissure veins exposed in the workings of this mine. Ore is blasted out in the stope in large enough quantities at one blast to run the mill for months at a time. At present, holes are drilled in one of the pillars that will admit of a charge of 1000 pounds of powder. This will be sbot off in a short time by means of a battery attachment. Past experience demonstrates that tbis can be done with perfect safety to the workings. To see this mine lighted up on each level is indeed a sight to be long remembered. Tue Caledonia is located on the same belt as the Homestake and Golden Terra, and while the ore averages about the same value, yet it is so much harder in character that nearly a ton a day less to the stamp is crushed. The mill is of 100-stamp capacity.

D. & D. SMELTER.—Dr. Carpenter left yesterday morning for Chicago to purchase machinery for the new D. & D. smelter. The smelter will cost, when completed, $800,000, at least half of which will be spent in Deadwood.

UTAH.

CENTENNIAL-EUREKA.—Eureka *Chief*, Nov. 15: Tbe richest ore body in the Centennial-Eureka—that on the 300-foot level—is now 18 feet wide and constantly growing wider. On account of the richness of this ore and the fact that their storehouses are all full of ore, no more will be shipped until silver advances. Tbe Centennial-Eureka is one of the greatest properties in Utah.

PARK ITEMS.—*Tribune*, Nov. 3: The Crescent Mining Co. shipped during the past week 400,000 pounds of concentrates. The upper tunnel of the Glencoe mine is looking fine, and the ore body continues to increase as developments are being made. Receipts at McIntosh sampler for week ending November 1st: 670,150 pounds of Ontario ore, 113,730 pounds of Anchor ore, 32,070 pounds of Daly ore, 20,700 pounds of Woodside ore, 283,060 pounds of Anchor concentrates, 34,450 pounds of Mayflower jiggings.

PARK DISTRICT.—*Stock Exchange Journal*, Nov. 15: Preparations are being made for a good winter's work in the mines in the Park. Supplies are being stored, wood hauled and everything made comfortable in and around tbe works. The output from tbe Park City mines next year will astonish the natives.

NOTES.—Park *Record*, Nov. 15: Tbe Apex will make a big shipment of ore as soon as the roads permit hauling by sleds. Ontario stock has declined to $38.50 per share, on account of the bear movement in New York. Work will be resumed shortly on the Montreal group, in Lower Snake creek. The tunnel is in nearly 400 feet and will be driven 200 feet farther. The leasers of tbe Roaring Lion are piling up a big lot of bigh-grade ore for sbipment as soon as enough snow falls to enable sledding down Thayne's canyon to the sampler. Tbe incline upraise from the Anchor tunnel to connect with the drain-hole in the shaft is progressing favorably. The mine is in splendid condition, and tbe output of high-grade and concentrating ore is increasing in volume. A few days ago Messrs. Gitsch & Macdonald encountered an eight-inch vein of galena ore between solid walls at a point 218 feet in their new tunnel in the Silver Key group, just west of the Apex.

WASHINGTON.

VARIOUS ITEMS.—Sultan City *Journal*, Nov. 15: All the mines in the Kootenai country are turning out good ore, going as high as $400 to the ton. One hundred tons of coal per day are taken from the South Prairie mines, and find a market in Tacoma. The 30-foot tunnel on the Ranger, belonging to the Wilman Bros., discloses tbe finest and richest grade of galena found in the State. The mineral wealth of the Upper Skagit country—its iron, coal and precious metals—is considered by those who are competent to judge as the richest and most extensive yet discovered in tbe West. The recent discoveries of rich coal mines at a point some 22 miles from Port Townsend has led to the organization of a $100,000 stock compaoy to develop the mines, which are said to be also rich in copper and silver.

LEAD AND SILVER IN THE CASCADE RANGE.—Sultan City *Journal*, Oct. 25: Mr. Wallace was in Sedro the otoer evening on his return from Seattle, where he has just bad assays made on some mineral be recently located near the head of Sauk river. Tbe ore run over 90 ounces of silver and upward of 65 per cent of lead, the assay demonstrating the value of the ore to be $173 per ton. Though it is getting late in the season, Mr. Wallace expects to again visit tbese choice locations before winter closes in to bar people out of the Cascades for the season.

Complimentary Samples.

Persona receiving this paper marked are requested to examine its contents, terms of snbscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its valne more widely known to others, and extending its influence in tbe cause it faithfully serves. Snbscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordersd soon enongh. If already a snbscriber, please show the paper to others.

THE London society of compositors has decided in favor of eight hours.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitore for Pacific Coast.

FOR WEEK ENDING NOV. 11, 1890.

440,257.—PRESERVATIVE—Benussi & Dondero, S. F.

440,348.—PRINTER'S GALLEY—W. C. Dillingham, Los Angeles, Cal.

448,223.—CARPET-CLEANING MACHINE—Wm. Fay, Oakland, Cal.

440,353.—WATER-WHEEL—W. H. Gunsolus, Sutter Creek, Cal.

440,565.—UPSETTING MACHINE—Silas Harris, S. F.

440,252.—PUMP—B. Jackson, S. F.

440,599.—PICTURE-FRAME HANGER—W. C. Keithly, S. F.

440,177.—GATE—Middlekauff & Harsin, Stockton, Cal.

440,443.—SELF-CLOSING GAS-BURNER—W. W. Sherman, S. F.

440,283.—SLIDING GATE—G. F. Sherwood, Salem, Or.

440,337.—SICKLE GRINDER—H. Thibault, S. F.

440,212.—GLOBE AND LAMP SHADE—O. F. Wegener, Seattle, Wash.

The following brief list by telegraph, for Nov. 18, will appear more complete on receipt of mail advices:

California.—Eugene S. Bonnelli, San Francisco, exercising device for musicians; Albert E. Braker, Ventura, drop regulating attachment for seed-planters; Rickwell S. Chaplan, San Francisco, hose reel; Arthur W. Coffin, San Francisco, ticket-punchor; Albert A. Dickie, Suisun, nut lock; Thomas E. Evans, San Francisco, machine for cleaning and polishing knives; George W. Haines, Stockton, traveling thrasher and cleaner; Henry O. Harper, San Francisco, lock; Henry Knight, South Riverside, universal steam joint; Joseph Korbel, San Francisco, guard for gang-edgers; John T. McLean, Santa Cruz, device for securing extra leaves in books; Demirij Medeleff, San Francisco, explosive; Anson L. Munson, Oakland, treating coal tar; George Rischmuller, San Francisco, safeguard for cable and horse-cars; James Rowe, San Francisco, composition for protecting piles; Philip Somerville, San Francisco, railway cable crossing; Charles W. Thompson, Tomales, automatic wagon gate; Sydney B. White, Los Angeles, stamp-cancelling and dating machine; James F. Wickham, San Francisco, stencil-cutter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SICKLE GRINDER.—Henry Thibault, San Francisco, Cal. No. 440,337. Dated Nov. 11, 1890. This machine consists of a support for the sickle, a means for fixing said support upon one of the wheels of the mowing or reaping machine, an adjustable standard, with a grinding disk mounted upon a sbaft thereon, and means for adjusting said disk to the teeth of the sickle and for rotating the disk to grind the teeth.

WATER-WHEEL.—William H. Gunsolus, Sutter Creek, Cal. No. 440,353. Dated Nov. 11, 1890. This wheel is of the "hurdy-gurdy" type. The novelty rests in tbe bucket, which is made heart-shaped, each bucket having a divisional rib formed by the rim of the wheel plate or disk extending from the back of one bucket into the wide end of an adjacent bucket. The object is to receive tbe impact of the water to the best advantage and to discharge it equally on each side, avoiding splashing and consequent interference of the discharging water with succeeding buckets.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

H. KELLEY—Modoc and Lassen Cos.
T. B. LESIEUR—Humboldt Co.
GEO. WILSON—Sacramento Co.
J. P. QUINETTE—San Francisco.
J. C. HOAG—San Francisco.
SAMUEL CLIFF—Creston, Cal.
W. W. THEOBALDS—Kern and Tulare Cos.
J. H. CROSSMAN—San Bernardino Co.
JOHN B. HILL—El Cajon, Cal.
W. B. FROST—Marin and Sonoma Cos.
GEORGE EVANS—Santa Clara Co.
MRS. M. E. DUDLEY—Ventura Co.
ANDREW REID—Monterey Co.
B F. BELT—Shasta Co.
FRANK S. CHAPIN—Colusa Co.
WM. M. HILLEARY—Oregon.
HENRY STACEY—Oregon.
WM. HOLDER—Oregon.
R. G. HUSTON—Montana.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of tbe Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

MECHANICAL PROGRESS

Progress in Metallurgy.

We are apparently on the eve of some important discoveries in the metallurgy and physical properties of iron, steel and other metals, says the *Engineering and Mining Journal*. In Howe's work on the "Metallurgy of Steel," some account is given of the recent developments in alloying steel by means of the new electrical process. A whole field of investigation is opening as to what uses can be made of the metal and as to what properties it has when alloyed with other metals. The time seems to be ripe for a most extended and scientific investigation, upon a large scale, of the properties of the whole series of commercial metals and their alloys. We are just finding out how dense has been our ignorance up to recent times concerning them. As an instance, ever since pig iron was made, a few hundred years ago, up to almost the present time, it has been considered that certain brands or grades possessed peculiar valuable properties, and that certain other branches and grades were inferior. Chemical analysis, after years of unsystematic and tentative experiment, gradually revealed that the variations in properties had something to do with chemical constitution; but it is only recently that it has been experimentally shown, what might have been foreseen, that a mixture of two different kinds of inferior iron, such as silver-gray and white iron or remelted scrap, in certain proportions, definitely determined by analysis, could produce a superior grade of iron, approximating to the best charcoal. Millions of dollars might have been saved if this fact had been known to founders during the past half century.

Experimental research on the metals has been carried on in the tentative method, here a little and there a little. An isolated fact has been discovered now and then and perhaps published, but its bearing upon other facts has been lost sight of till some other discovery, made years afterward in another part of the world, might throw light upon it and lead still further. Heath put manganese in steel in 1845. Bessemer decarburized iron by air in 1856, but left out manganese, and his metal was red short. Mushet discovered that what Heath did, would improve Bessemer's metal. Siemens later invented the regenerative furnace, which was all that Heath lacked to make open-hearth steel, but he also left out manganese, and it was left till some time later for Martin, in France, to add together what Heath and Musbet and Siemens had done, and make open-hearth steel; and yet other years passed by before it was known that boiler plate must be low in both phosphorus and carbon to be of first quality. The introduction of steel boiler plate was delayed for years on account of the ignorance of the fact.

Growth of the American Iron and Steel Interests.

The present importance and high relative rank of the American iron and steel interests, together with the great assistance a protective policy has given to their development, are admirably illustrated in a brief article giving a synopsis of leading incidents in the history of the American iron industry, published in the Bulletin of the Iron and Steel Association and a compendium of statistics relating to this subject contained in a neat pamphlet issued by that association. It is hard to realize that the American product of pig iron has grown from 60 377 net tons in 1810 to 323,331 tons in 1840, 919,770 tons in 1860, 4,295,414 tons in 1880, and 8,516,079 tons in 1889. The development of all steel-making industries has proceeded with corresponding rapidity from 30,000 tons in 1868 to 819,814 tons in 1878, and 3,792,020 tons in 1889. As a result of this rapid growth, the United States closely approached Great Britain in 1889 in magnitude of product of pig iron and steel, and made last year 30 per cent of the pig-iron product of the world, and 31.5 per cent of the world's product of steel.

Of the influence of a protective policy in promoting this extraordinary advance and its bearing on railway construction, the Bulletin forcibly says: "The stimulating effect upon our iron and steel industries of the protective policy which was firmly established since 1861 has been marvelous. The world has never known such wonderful progress in any of its leading industries as has been exhibited from 1861 to 1890 in the growth of our iron and steel industries. To-day we are the leading pig-iron producing country in the world, distancing our great competitor and our persistent industrial rival, Great Britain, in the production of this essential aid to modern civilization. The census statistics of 1890 establish this fact. We have for many years produced more Bessemer steel and more Bessemer steel rails than Great Britain or any other country. We have more miles of railroad than the whole of Europe. We could not have had this vast railroad mileage if we had not been able to produce Bessemer steel rails in large quantities and at low prices."

CHARACTERISTICS OF SUPERIOR BELTING.—A London journal says that to test the quality of belting, a sure method is to take a piece, say 8x2 inches, and cut it down four inches into two strips, each one inch wide, and submit the leather to a tearing strain; if of the best grade with respect to quality of hide and quality of tanning and currying, it will have great power of resistance, but if torn, then most of the fibers will not pull out, but will break, because they are thoroughly united to each other by gummy oil; and if, in the tearing strain, the fibers pull out to a great extent, that is an indication of imperfect or incomplete currying, though the original quality of the tanned leather may have been good, for a poor piece of leather tears easily and a majority of the fibers break short off. A final and conclusive evidence consists in testing the fibers themselves, by seizing them with the fingers at the place of rupture and subjecting them to a breaking strain. In a piece of material which is of really poor quality the fibers have little strength, and this is easily perceptible.

SHAPING METALS BY ELECTRICITY.—Mr. Herman Lemp has patented a device for forming or shaping pieces of metal when rendered soft or plastic by an electric current. In carrying out the invention, it is proposed to use a transformer provided with a secondary of very low resistance, so as to produce a current of great heating volume. The terminals of the secondary are brought adjacent to each other and provided with clamps, one of which is arranged to slide to or from the other. The piece of metal to be operated upon is secured by the clamps at its ends, and the primary circuit of the transformer thrown into connection with an alternating current circuit. The bar of metal is soon heated to plasticity, when the sliding clamp is withdrawn, thus rupturing the metallic bar being operated upon. A die is then placed over the plastic ends of the bar, and the sliding clamp is forced inwardly so as to drive the heated ends of the bar against the face or faces of the die, thus producing a swaging action on the softened metal and causing the same to assume the form of the die. The advantages claimed for this invention are great expedition of manipulation.—*British Mail.*

NOVEL GERMAN INVENTION.—A Berlin inventor has devised an elevator which is said to be simple and inexpensive. It is described as follows: It is on the principle of an inclined railway, and the motive-power is furnished by water, which is applied in the cellar; each flight has its separate chair, so that, for example, one person can ascend from the first to the second story while another is on his way from the second to the third, or still another is descending from the fifth to the fourth. The chair, being only the width of the human body, requires but little space, and still leaves a free passage for any who wish to walk up or down instead of riding. It is set in motion by a simple pressure upon one of its arms, while after it has been used it slides back to the bottom step, its descent being regulated in such a manner that the carrying of a passenger is a matter of entire safety. The motive-power is, of course, more or less expensive, according to the cost of water.

"WOOTZ" is a peculiar quality of iron made from time immemorial by the natives of India. It is especially valued for edge tools. The *Times of India* writes in regard to it as follows: "It would certainly be worth while to take the question of producing 'wootz' on a large scale into consideration. If it paid a Persian trader to make periodical visits from Ispahan to Nirmal in the Subah Berar for the sole purpose of obtaining this iron for the Persian armorers, it would probably pay to export it to England. The iron is found in a very pure state in fine grains among a kind of mica schist. The treatment of the ore was local and peculiar; two qualities of iron obtained from magnetic iron sand and laterite respectively were blended in the steel crucibles. Very hard steel cakes, called by the natives 'wootz,' were thus produced, the heat to which they were subjected being exceptionally high."

FOREIGN IMITATION OF AMERICAN KNIVES.—The importation of foreign goods stamped as if manufactured in the United States ought to have been stopped long ago. Under the guise of home production, the country has been flooded with worthless articles which no reputable manufacturer here would attempt to compete with. A very fruitful commodity under this head has been the pocket-knife, bearing an American imprint of some nondescript company, but made of inferior materials in Germany or wherever the cost of labor is but a pittance. That our manufacturers engaged in this industry should have felt the injurious effects of such nefarious practices is not surprising, and we shall gladly hail the day when it will no longer be possible to perpetuate them.—*American Merchant.*

PRESSURE USED IN DRILLING CAST IRON.—Prof. Breckenridge of the University at Leigh has, according to *Le Genie Civil*, made several experiments for the sake of ascertaining the pressure required to drill through cast iron. A cylinder was filled with oil and provided with a pump piston 10 square inches in area, to which was attached the pressure of 181 kilograms, while for drills of $\frac{1}{2}$, $\frac{3}{4}$, 1 and $1\frac{1}{4}$ inches diameter, the corresponding pressures rose to 407, 498, 566 and 815 kilograms.

COMPOUND ARMOR TESTS at Amager, near Copenhagen, fully corroborate the results of the recent trial at Annapolis. The Cammell compound plates were found to be much inferior in resisting power to the Creusot steel plates. No nickel-steel plates were tested.

SCIENTIFIC PROGRESS.

The Human Body Forty Years Under Water.

A very interesting report has just been issued by Dr. Konig, judicial physician of Hermannstadt, on the state in which the human subject, after 40 years' immersion in water, may be found by the physiologist. In the revolutionary upheaval of 1849, a company of Honveds, having fallen in the vicissitudes of war, were consigned to the waters of the Echoschacht, a pool of considerable depth not far from Hermannstadt. After some 41 years their bodies have been brought up again to the light of day and subjected to a careful and minute investigation from the physiologist's point of view. Dr. Konig found them in perfect preservation, without a single trace of any decomposing process. Externally they had the appearance of having been kept in spirit, like so many preparations in an anatomical museum. The epidermis was of a whitish-gray color, the muscles rose-red, feeling to the touch like freshly slaughtered butcher's meat. All the inward parts—the lungs, the heart, the liver, the spleen, the kidneys, the bladder, the stomach, the alimentary canal—were of the consistence of those in a newly deceased corpse, while the brain was hard, of a dirty gray color, as if preserved in spirit. Structurally, the organs retained their outline perfectly, and were so easily recognizable in tissue as well as configuration that they might have been exhibited for "demonstration" in an anatomical lecture-room.

After 41 years under water, this is indeed a remarkable phenomenon. The large intestine contained fæces of a yellowish brown color, quite unaltered and quite inodorous, while the bladder was partially filled with straw-colored urine.

But perhaps the most significant feature disclosed by these corpses is the following: In their interior, abundant chloride of sodium crystallized in cubes, had been deposited and fixed on the several tissues and organs. These salts had not penetrated, mechanically, into the bodies from without, for on the outer surface of the heart itself, salt crystals of the same kind, to a weight of five grammes, were found adherent. This, according to Dr. Konig, clearly shows that, in the water, particles held in solution may pass through the skin and the muscles and find their way into the most deeply seated organs. Herein, he adds, we have confirmatory proof, if such were needed, that the specific virtues of mineral baths exercise in this way their salutary effect on the internal economy of the invalid bather. There is a notable difference, however, between the time spent in the bath by an ordinary bather and the 41 years during which the Honveds remained under water. The phenomenal stillness of the Echoschacht may also have been a material factor in this impregnation of the corpses with chloride of sodium. But, with every allowance for such considerations, Dr. Konig has furnished a striking illustration of the permeability of the immersed human subject to salts in solution, and we hope his painstaking researches will lead to others in the same important direction.—*The Lancet.*

Another Greenland Exploration.

Lieut. R. E. Peary of the United States Navy has a plan for completing the survey of Greenland that is different from any undertaken before, and he firmly believes in its feasibility, as he had the initiatory experience of a 200-mile walk over the ice cap of that far, mysterious land four years ago. The scheme he proposes is to sail as far up the west coast of Greenland as possible, and start thence on foot, walking near the edge of the ice cap until he reaches the farthest point north. Thence he can go down the eastern coast—if supplies and enthusiasm hold out—until he reaches Cape Bismarck, at the northmost limit of exploration on that side, as Cape Washington is on the other. From that point he can cut westward across the continent, as Nansen did recently, and reach his starting-place, where his ship would be waiting.

The whole of Greenland, except a strip of a few miles along the coast, is covered with ice, not a mere sheet, such as we find on high peaks or on the ground in winter, but an enormous hulk thousands of feet thick, under which elevations greater than those of the White mountains are entirely buried. The edge of this ice cap is cracked and seamed with dangerous crevasses; but on the higher ice just within this edge, it is as firm as marble and stretches to the horizon, a white plain, dazzling in full day and reflecting rose, pink, violet and orange when the sun is low at night. There are occasional hollows filled with drifts and slush, but these Lieut. Peary crossed on snowshoes on his former journey. His provisions, he and his companion bore on a light, strong sledge that also served to carry them down slopes with the speed of a tobogган and went briskly before the wind on level surfaces, with the aid of a small sail. So equipped, this courageous explorer would undertake a survey of Northern Greenland.

It is easy and perhaps natural to decry such experiments on the score of inutility, but results are better than forecast as a criterion of usefulness. This is an age of truth-seeking and of some truth-getting, and no fact, however remote it may appear from daily experience, or how trivial in its human relations, is valueless. The restless activity of the nineteenth-century explorers is balked by nothing, and if this officer does not determine the coast line of Northern Greenland, the risk and the honor may be assumed by a representative of some other nation. America, with Lieuts. Greely and Lockwood as its deputies, has "broken the record" thus far, and Lieut. Peary wishes to complete it. The plan he proposes is cheaper, more direct, more feasible than that of his predecessors, and it is safer. His mapping of the coast line would appease the hunger for geographical knowledge that dictates the resolve of men to find what sort of world this is upon which we live, and might prove of some economic worth. *Brooklyn Eagle.*

THE CAT IN ANTIQUITY.—At a recent meeting of the Academy of Inscriptions in Paris, M. Saglio discussed the question of "The Cat in Antiquity." Was the cat known to the ancients? If so, should it be considered as having been with them a domestic animal or a tamed one like the monkey or the gazelle? Some of the members, taking as a basis the differences established by Virchow of Berlin between the Egyptian cats (thousands of mummies of which are found in the cemeteries of Egypt) and the cat that we know to-day, claimed that the animal of antiquity and that of our time were no more the same animal than is the mouse of the present and the mouse of antiquity. The cat of antiquity, according to some, was slimmer, and resembled the weasel more than it did any other animal. M. Saglio presented to his audience the figure and the fac-similes on various monuments in support of an observation that he made on the subject. These were, primarily, paintings on Etruscan tombs in which cats are represented in the interior of dwellings. In one of them, especially, a kitten, during a repast, is seen playing with other animals under the couches upon which the guests are reclining. We find the cat figured also in the paintings on Greek vases of the fifth century before Christ. Upon two pitchers in the British Museum, the paintings on which seem to be due to the same hand, are to be seen domestic cats in the interior of a school of music. One is tied up by a string, and the other stands upright on a stool, and a young man is offering a cake to it. All these, and similar fac-similes, perfectly authentic, reproduce the image of a cat, perhaps a little slimmer than ours, but exactly like the animal that we now designate by the name.

SECRETION OF SILK BY THE SILKWORM.—Prof. G. Gilson is of the opinion that the silk of the silkworm is a regular secretion product. He bases this view on the fact that the glandular tube is covered internally, throughout its length, with a transparent membrane. This contains circular threads, and the spaces between them are filled with a network formation. As the silk is always separated from the cells by a membrane, it cannot be the result of the direct transformation of the protoplasm. In the next place the silk is not, as a rule, to be detected by any reagents in the body of the cell, but in some cases it becomes really visible. At the end of larval life, certain shining spherules were formed in the cells, and the reactions of these were just the same as those of silk. If one impedes the excretion of the silk at the end of larval life, the cell body becomes quite burdened with silk spherules. It seems that the silk is made up within the protoplasm, and is cast out through the meshes of the net-like membrane. A selection is probably made by the membrane itself among the several substances that are mixed with the liquid part of the protoplasm and the silk, and the substance that becomes the silk is cast out. The special apparatus of the silk duct seems to regulate the diameter of the thread, which is often very irregular before it has passed through it, and probably also to regulate the thickness of the thread.

THE SMALLEST FLOWERING PLANT.—The smallest flowering plant is *Wolffia microscopica*, a native of India. It belongs to the duckweed family. It is almost microscopic in size, destitute of proper stem, leaves and roots, but having these organs merged in one, forming a frond. There is a prolongation of the lower surface, the purpose of which seems to be to enable the plant to float upright in the water. The fronds multiply by sending out other fronds from a slit or concavity, and with such rapidity does this take place that a few days often suffice to produce from a few individuals enough similar ones to cover many square rods of pond surface with the minute green granules. Small as these plants are, they bear flowers. Two are produced on a plant, each of them very simple, one of a single stamen and the other of a single pistil, both of which burst through the upper surface of the frond.

RESPIRATION OF INSECTS.—Mr. Contejean has studied in the grasshopper the little known phenomenon of the respiration of insects. He finds that, contrarily to what occurs in vertebrates, the movement of inspiration is passive, while that of expiration is active. The air is expelled from the insect's body by a contractile effort. The result is, that if the animal be wounded, we observe blood to flow at every expiration. Decapitation does not arrest the respiratory movements, no more than does the absorption of curare, which in man produces an immediate cessation.

USEFUL INFORMATION.

How Gold Is Shipped.

As few people realize the vast bulk of gold coin that is shipped annually from one country to another, and are unacquainted with the manner of shipment, the following from the *American Banker* will be interesting:

The Bank of America is the largest single shipper of gold from New York, and indeed from the United States. Shipments are made in stout kegs, very much like the ordinary beer keg. Every one contains $50,000 in coin or bar gold. The latter is the favorite for these shipments, since the Government has permitted the Sub-Treasury to exchange coin for bar gold, as coin, in a single million-dollar shipment, is liable to loss by abrasion of from 8 to 20 ounces, or from $128 to $320; while the bars only lose about three-fourths of that value. Where coin is sent, double eagles are preferred. They are put in stout canvas bags, each containing 125 double eagles, or $5000; and ten bags fill each keg. About the only precaution taken against tampering with kegs is a treatment of keg ends technically known as "red-taping." Four holes are bored at equal intervals in the projecting rim of the staves above the head. Red tape is run through these, crossing on the keg's head, the ends meeting at the center, where they are sealed to the head by the hardest of wax and stamped with consignor's name. The average insurance is about $1500 per $1,000,000. There is an expense of about $2 per keg for packing and cartage aboard ship, or $200 for the same sum and the inevitable loss by abrasion, whatever it may prove to be. There are great Wall-street firms shipping from $25,000,000 to $40,000,000 annually. Some of these have for years insured themselves, and assert that the saving has been sufficient to replace a loss of $1,000,000. These are large figures, but this has become a country of large figures and affairs.

TO STRENGTHEN ROPES.—It has been suggested by a French exchange that, in order to insure greater strength, and consequently more safety, in ropes used for scaffolding purposes, particularly in localities where the atmosphere is destructive of hemp fiber, such ropes should be dipped, when dry, into a bath containing 20 grains of sulphate of copper per litre of water, and kept in soak in this solution some four days, afterward being dried; the ropes will thus have absorbed a certain quantity of sulphate of copper, which will preserve them for some time, both from the attacks of animal parasite and rot. The copper salt may be fixed in the fibers by a coating of tar or by soapy water, and in order to do this, it may be passed through a bath of boiled tar hot, drawing it through a thimble to press back the excess of tar, and suspending it afterward on a staging to dry and harden. In a second method, the rope is soaked in a solution of 100 grammes of soap per litre of water. The copper soap thus formed in the fiber of the rope is said to preserve it even better than tar is capable of doing, which acts mechanically to imprison the sulphate of copper, which is the real preservative in the case.

A SCIENTIFIC MOSQUITO BAR.—Word comes from Paris of the invention of what may be called the alternating mosquito bar. This consists of a mosquito net made of extremely fine copper wire woven into a cloth, which is strong and at the same time almost as pliable as a netting made of vegetable fiber. This net is made in the usual form of a canopy and falls in shining folds about the bed. In the dome of the canopy hangs a small electric lamp. Wires connect the netting with a weak pile battery placed under the bedstead, and by means of a converter are carried into the lamp. The lighted lamp attracts the attention of all the mosquitoes in the neighborhood, and they come sailing over and light upon the wire canopy. The battery presses the button, and the mosquitoes do the rest. M. Soherer, the inventor, says that on the first morning after his net had been put into use, his servant took up 3.22 litres, or nearly three quarts of dead mosquitoes.

THE RAPIDITY OF THOUGHT.—Much speculation has been set on foot in regard to the rapidity of thought; but Prof. Donders of Utrecht has recently made some interesting experiments in this direction by means of two instruments which he calls respectively the "neomatachograph" and the "nematachometer." His experiments thus far show that it takes the brain one sixty-seven hundredths of a second to elaborate a single idea. He says: "Doubtless the time required for the brain to act is not the same in all individuals. I believe, however, that these instruments may be so far perfected that we shall be able to determine the mental caliber of our friends without our friends knowing that we are testing their aptness." And again: "For an eye to receive an impression requires seventy-seven hundredths of a second, and for the ear to appreciate a sound, one hundred and forty-nine hundredths of a second is all that is necessary, which, however, acts with nearly double the rapidity of the eye."

TO CLEAN SHOES INSIDE.—A shoe dealer recommends the regular cleaning of the inside of the shoes, which he says are the most poorly ventilated of all the clothing. A solution of aqua ammonia slightly stronger than that used for bathing purposes may be applied to the inner surface of the shoes by means of a sponge fixed on a flexible wire.

GOOD HEALTH.

Health of the State

The monthly circular of the State Board of Health for October gives reports from 80 localities, with an estimated population of 754,639, the deaths being 1016, an annual death rate of 16 08 per thousand.

Among the causes of death were: Consumption, 150; pneumonia, 56; bronchitis, 20; croup, 18; cholera infantum, 32; diarrhea and dysentery, 13; typhoid fever, 36; cancer, 20 [below the monthly average for the year thus far.—EDS. PRESS]; heart disease, 89; alcoholism, 15; other diseases and those not classified, 457.

Diphtheria is charged with 39 deaths, which is a large increase over the mortality caused by this disease last month. Twenty of these deaths occurred in San Francisco, where the disease is quite prevalent.

Important Suggestions in Regard to Diphtheria.

Diphtheria and croup have been quite prevalent during the month, assuming a malignity in many cases that has been quite unusual hitherto.

In view of this prevalence, the State Board of Health has deemed it advisable to publish, for gratuitous distribution, a small pamphlet on the disease, its restriction and prevention, which can be had on application to the secretary in Sacramento.

The conditions being favorable for the development of the disease, the local health authorities should look more strictly to the public safety than they apparently do in the presence of these cases of diphtheria. They have the power of requiring from those persons attacked in that regard to residence and otherwise they shall so conduct themselves as not to unnecessarily multiply the chances of extending the affection to others. Public funerals shall be strictly forbidden, and the transportation by rail of those dead from diphtheria should not be allowed, except under the most stringent provisions and competent inspection. Each case of such disease is a public danger, against which the public is entitled to be warned by proper information.

Any person knowingly having this disease under his care or control, who voluntarily neglects to take all the necessary precautions to prevent its spread, should not only be punishable by penalty as for an act of nuisance, but should be liable to pay pecuniary damages for whatever harm he may occasion to others. At this time it would be well for parents to keep a watchful eye upon the animals with which their children play, as it is a well-ascertained fact that dogs and cats are very frequent carriers of infection into a household. An instance occurred in Sacramento where a pet cat contracted diphtheria from a sick child and conveyed it to a neighbor's child who unfortunately played with it just after it had left the infected home. Cats having diphtheria generally display it by a yellow discharge through the nose, a gummy secretion about the eyes, a hoarse voice and a desire for quiet and seclusion. Dogs are not nearly so subject to diphtheria as cats, but are liable to carry the infection on their hair. A curious fact, recently discovered by Dr. Klein, and confirmed by the health officers in London, is that cats suffering from diphtheria manifest the disease more frequently in inflammatory deposit in the lungs than elsewhere, and while in this condition they were as capable of communicating the disease to children as when it manifested itself in the throat and nose.

In San Francisco the disease is reported as almost epidemic, and ascribed to emanations proceeding from filthy sewers. It was also quite prevalent in Sacramento in the vicinity of the drainage canal. It is also reported in many of the interior towns. The extension of this disease to so many parts of the State may, perhaps, be attributed to some condition in the atmosphere of which we are ignorant, but we do know that wherever the germ is deposited it is nurtured in filth and developed where sanitation is deficient.

Precautions to Be Taken in This City.

The important suggestions given out in the above report of the State Board of Health should be carefully considered and closely attended to. The Board of Health of this city are fully alive to their duty here and are taking active precautions to check any further spread of the disease. It is generally conceded that the chief cause of the prevalence of the trouble in this city is the foul condition of the sewers. In addition to flushing, it is proposed to secure better ventilation by opening the sewer cover at the highest points so that the gases, which always ascend, may be allowed to escape into the open air, instead of through imperfect plumbing, into our dwellings.

The suggestion has also been made that the schools should be closed for a short time; but the indications are that we have already seen the worst, and that the flushing and more perfect ventilation of the sewers will be sufficient to arrest the destroyer.

ELECTRICITY.

The Possibilities of Electricity.

The possibilities of electricity are rapidly being developed into actualities, which are changing business methods, making neighbors of cities hundreds of miles apart, and realizing the dreams of even Edward Bellamy.

The most interesting of recent electrical incidents is the development, purely as a business project, of the facilities for the transmission of any kind of vocal or instrumental music or entertainment to any number of places at great or small distances.

A few days since, says the New York *Times*, some experiments were made in the office of the American Telephone Company at New York. In the first place the telephones were tested. Boston, 300 miles away, was rung up, and then ensued a pleasant conversation. The operator in Boston was a young woman, who at once struck up a spirited discussion of the latest development in theosophic Buddhism. Her voice was not raised so much as in ordinary talking, and its expressiveness was perfect. Washington, 235 miles away, was also tried. Every word was heard distinctly.

The efficiency of the metallic circuit telephone is fairly well understood. The circuit now comprises 42,000 miles of copper wire, and Boston, Providence, Worcester, Springfield, Albany, Syracuse, Rochester, Buffalo, Elmira, Wilkes Barre, Philadelphia, Baltimore, Washington and many other big cities are reached with ease and expedition. Business houses are rapidly learning to use the long-distance wires to the greatest advantage. The telephone no longer holds the position of messenger—it is now the confidential agent. Many big firms use it systematically. Several, for instance, engage wires for the first 20 minutes of each of ten hours in a day. The head of a firm can from a distance direct his city affairs and dictate letters exactly as if he were in his own office. Great numbers of wholesale houses are saved the expense of keeping large quantities of goods on hand. All arrangements for sales and shipments can be made directly with the factory.

Recently a well-known corporation in Boston, having several members in New York, held a meeting "on the wire," as it were. The roll was called, resolutions were passed and all business was transacted, the New York members taking an active part, but being able to do it in a fraction of an hour and saving the time, expense and trouble of a journey to Boston.

These are but a few examples. Every day the use of the wires is increasing, and every day the line is being pushed nearer to Chicago. It will reach there in the course of a year, and the entrance of the long-distance phonophone into San Francisco is only a matter of time and capital.

The phonograph will play an important part in the scheme of transmission of music, etc. When the multiple resonator is perfected it can be attached to a phonograph and connected with the wires, taking the place of the orchestra or lecturer, and the death of great musicians will not by any means necessitate a cessation of the enjoyment of their renderings of music.

A POWERFUL ELECTRIC LIGHT.—An English paper says: Usually we look to America for the biggest things on earth, but strange to say, although the Americans are the most extensive users of electricity, the most powerful artificial light in existence is the property of the English Government, and is to be found in a lighthouse on the Isle of Wight. The light is obtained from a carbon lamp of special pattern. The ordinary light is equal to *three million candles*, but a light of six-million candle-power can be and has been obtained. It is impossible for any one who has not seen it to imagine the wonderful brilliancy of the light, but some idea may be formed from the fact that it can be distinctly seen 45 miles away, and that at the Needles, 14 miles distant, it is quite easy to read very fine print by means of the reflection.

ELECTRIC CARS.—Nearly 2000 electric cars are running in the United States. Boston alone has about 100 miles of electrically operated roads. Several systems have been developed to a perfection that insures smooth and regular service. Other systems are still more or less in the experimental stage.

STORAGE BATTERY TRACTION is being rapidly pushed in New Orleans. Thirty cars in all are to be installed within the next few months. Thirty trucks are already mounted with motors and prepared to receive the car bodies.

A STEEL PLANT, it is reported, has just been located at Jacksonville, 12 miles north of Anniston, Ala., which, when complete, will employ 3000 hands. It is placed by the Eastern syndicate at a cost of $3,000,000. The product of the plant will all be worked up by the company in other plants, located for that purpose.

THE WOONSOCKET RUBBER CO. has just completed and put into operation the largest rubber shoe factory in the world.

THE National India Rubber Co. of Bristol, R. I., employ 1000 hands and pay out $37,000 monthly for wages.

The Knowledge of the Ancients.

The opinion seems to be gaining ground that we, of this age, do not fully appreciate the progress which the people of the early ages of the world had made in science and the mechanic arts. Some of the remains of early architecture and evidences of scientific research anterior to and quite down to the builders of the pyramids are a puzzle to us, unless we admit that the people of those days were much further advanced than they are generally supposed to have been.

Our attention has been drawn in this direction by a singular publication, which has recently made its appearance, entitled "A Wonderful Discovery in the Book of Job," wherein it is argued that in the time of Job not only the motive-power of steam was known, but that the locomotive and the modern railroad was also known and employed. Mr. Samuel O. Trudell is the author of the book in question, which consists of not less than 362 octavo pages. Mr. Trudell holds that the Behemoth of Job was the steam engine, and the modern railroad was the Leviathan. The description of these two "animals," as they have heretofore been thought to be, has always puzzled the scientists; but our author has endeavored to throw some new light upon the subject. Of course Mr. Trudell, being a thorough Hebrew scholar, comments on the Book of Job in its original language—he is his own translator.

The *Scientific American* cites from the special translation which is appended to the book some of the most striking passages, as follows:

The account begins chap. xl., v. 15: "Behold now one with great heat, . . . he will consume fodder as well as cattle do," which is a pretty fair description of a steam engine. A little farther on, v. 17, it says: "His tail will set upright like a cedar." This, the author concludes, refers to the smoke-stack. In v. 18 we find, "His hollow bones are tubes of brass, his solid bones are bars of iron," which is a very good embodiment of modern engineering practice. In v. 21, which the special translation renders, "He will rest beneath light shelters and within a covering of fibrous reeds and clay," the author finds an allusion to non-conducting covering for boilers and steam pipes. Going on to the next chapter, we find v. 6 thus rendered, "Companies will feast upon him, they will share him among speculators," which it is needless to say fits the case of modern railroad companies and speculators exactly. This is one of the extraordinary parallels of the work. It is perhaps equaled by v. 2 of the same chapter, where the hook (ring) in the monster's nose is construed as an allusion to the piston rings of a locomotive, and where the jaw bored through with a thorn supplies an allusion to the piston head bored through with its piston rod. The bad effects of an engineer allowing his water to run down is given in the same chapter, v. 26: "From dryness rendering him furious, he will not have power to withhold; the curved vault being caused to break up and also the armor." This, of course, means that the engineer must watch his water-gauges or there will be an explosion.

For a portion of v. 23, chap. xl, and for v. 24 immediately following, the author furnishes the following translation: "Behold he will absorb a river and will not fret; . . . . he will gather it up in his fountains by means of traps and with a perforated nozzle." Our author in this finds described the action of a pump with its valves (traps), and the perforated suction pipe with a screen at its end to exclude solid particles. Even the coupling together of a train of cars is found in v. 1 of the next chapter: "Thou wilt extend Leviathan with a hook, or with a snare which thou wilt cause his tongue to press down." The tongue our author believes is the representative of the coupling link, and the hollow drawhead and pin is the "snare." The calking of the seams of the boiler is found in v. 15 of this chapter: "His strength depends on courses of shields closed up tightly with a seal." Our author finds nothing clearer than that the "shields" are boiler plates, and the "seal" the calking iron. He reserves, however, the possibility that the steam riveter is the sealing mechanism.

This much is enough to give an idea of the book. The author has been his own Hebraist. The Semitic student and author, Rabbi Benjamin Szold of Baltimore, testifies to his high opinion of Mr. Trudell's translations. It must also be said in conclusion that the subject is treated throughout with full evidence of critical discernment and laborious investigation.

TO KEEP PANS FROM RUSTING.—Tin pans can be prevented from rusting by heating them and rubbing well with linseed oil and heating again. Wood ashes or whiting (which is better) mixed with kerosene will brighten them.

CINCINNATI, OHIO, produces the largest amount of wood-working machinery in the world.

A CHICAGO firm lately received an order for $130,000 worth of machinery for China.

TABLE OF CONTENTS.

EDITORIALS.—The Rife Hydraulic Engine or Ram; Fuel Gas; What Greeley Would Say, 329; Passing Events; An Important Factor Ignored; A Country Worth Looking After; The Money Panic and Its Lesson; Some of the Benefits California Derives from Mining, 336.

ILLUSTRATIONS.—Producer for Fuel Gas; The Rife Hydraulic Engine, 329; Glass Houses at San Gabriel for the Protection of Vedalia Cardinalis Through the Winter. 331; Best s Traction Engine Hauling Gravel. 337.

MISCELLANEOUS.—The Gold Belt of Northern California; San Bernardino County; Eight Hours a Day; Senator Sherman's Prophecies; Trans-Andine Railroad, 330; What Constitutes an Accident? Exploring the Canyons of Colorado; What Inventiou Does; Priests and Politics in Japan, 331; The Knowledge of the Ancients. 335.

MECHANICAL PROGRESS.—Progress in Metallurgy; Growth of the American Iron and Steel Interests; Characteristics of Superior Belting; Shaping Metals by Electricity; Novel German Invention; Wootz, Foreign Imitation of American Knives; Pressure Used in Drilling Cast Iron; Compound Armor Tests, 334.

SCIENTIFIC PROGRESS.—The Human Body Forty Years Under Water; Another Greenland Exploration; The Cat in Antiquity; Secretion of Silk by the Silkworm; The Smallest Flowering Plant; Respiration of Insects 334.

USEFUL INFORMATION—How Gold is Shipped; To Strengthen R pes; A Scientific Mosquito Bar; The Rapidity of Thought; To Clean Shoes Inside. 335.

GOOD HEALTH.—Health of the State, 335.

ELECTRICITY.—The Possibilities of Electricity; A Powerful Electric Light; Electric Cars; Storage Battery Traction, 335.

MINING SUMMARY—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 332-333.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments. Dividends, etc., 340.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 340.

Business Announcements.

[NEW THIS ISSUE.]

Hydraulic Engine—Rife's Hydraulic Engine Mfg. Co., Roanoke, Va.

Passing Events.

The fruit season drawing to a close has been one of the most successful in the history of the State.

The threatened Indian troubles assume toward the end of the week a more serious aspect, affairs in the Dakotas being grave indeed.

The striking ironmolders in this city claim for the movement a gratifying success, in that the strikers have for the past eight months been able to live comfortably and without work on the money donated by sympathetic guilds and friends of the cause.

In this connection, it may be stated that the boycott has, by a finding of Judge Armstrong, just promulgated, been decided to be illegal.

The price of silver, after dropping in the early part of the week almost as low as it ever has been, rallied later on, being quoted at 99 cents at the time of our going to press. Further improvement in the price is counted upon.

Stocks of most kinds have also recovered in part from their recent tumble.

The controversy between Stanley and his followers continues to be waged through the columns of the newspaper press to the damage of the contestants and the disgust of the public.

Of the weather during the week there is nothing new to be said, it having been of a piece with that which has obtained for the past eight months. The sun coming up over the Sierra and traversing an atmosphere all aglow with yellow light has gone down in the ocean, repeating this journey day after day till we Occidentals tire of this too protracted Indian summer. We would be glad now to exchange a few of these baleful days for a like number dripping with rain and sleet, even at the hazard of their bringing with them the southeast tempest. After such continued drouth we would be willing to accept a drenching rain coupled with the cyclones so often visited on the ungodly people east of the Rockies. Could we dodge the thunderbolt as adroitly as they, we would also willingly take in that.

Though the rains have been so long withheld, the water supply continues good, owing to the immense quantities of snow that fell on the mountains last winter.

An Important Factor Ignored.

The advocates of free trade, in considering its application to this country, strangely overlook the fact that we are not only large importers of the products and manufactures of other nations, but that we are large importers of their labor as well. We not only take their surplus wares and merchandise, but we take also their surplus population. Under this arrangement the condition of things here is altogether unusual and exceptional, the above practice obtaining with no other large and progressive nation in the world. We admit into the United States from European countries more than a quarter of a million people every year, the majority of whom having reached maturity want employment as soon as they get here.

A large proportion of these immigrants are mechanics, artisans, or factory hands, and cannot well earn a living except at that particular branch of business to which they have been trained. But to start this business, whatever it may be, they have not usually the means, wherefore they must abandon it to their great detriment or remain idle, unless other parties able to do so can be induced to start it, and thus afford them an opportunity to earn a subsistence at the calling for which they are best adapted.

But who is going to do this unless protected by a tariff that will enable them to successfully compete with the cheap labor of the countries whence these immigrants come, and which they have left just because labor has there been reduced to starvation prices? Certainly, no one; which being the case, what is to be done with these immigrants so left without work or other means for supporting themselves?

Set them to cultivating the land, of which we have so much still remaining unoccupied, say these free-traders. But these lands are far remote. It requires money to reach and improve them, which, as stated, these poor people do not possess, nor have their previous habits and training been such as to fit them for successfully pursuing the business of farming. Moreover, the cultivators of the soil might not care to see so many rivals coming in to share with them the scanty profits of their already crowded vocation. That new factor in our National politics, the Farmers' Alliance, might and doubtless would prefer to see this foreign element employed at something else—might possibly prefer to have it wholly excluded from the country.

Clearly, then, we must either stop this importation of laborers or find something else than farming for them to do. What shall it be? Can these free-traders tell us? Where is this army of poor, helpless foreigners that is every year being landed on these shores to go? What shall we do with them? We cannot reship them to the places whence they came; we cannot drive them into the sea, nor does it seem possible for us to prevent their coming in hereafter.

It is singular that this aspect of the industrial problem should so have escaped attention. Never, so far as we know, have any of our political economists considered this immense importation of labor into the United States in connection with its bearings on the question of a protective tariff. These theorists adopting a rigid rule adhere to it under such exceptional conditions as here prevail. Because free trade may be a good thing for some countries, they conclude it must be good for all, and so devoid of sound business sense and practical wisdom, they ignorantly disseminate the most pernicious teachings, thereby antagonizing the best interests of their own country.

A Country Worth Looking After.

A bill providing for the exploration of Alaska and appropriating $100,000 for that purpose has been placed on the calendar of the House of Representatives. By the provisions of this bill a detail from the army is to be stationed in the interior of the Territory and there retained for such length of time as will enable the same to be thoroughly explored and its mineral and other natural resources ascertained, as far as may be. This bill ought to be enacted into a law as soon as possible.

While the exploration of most other portions of the public domain may be left to be effected by private enterprise, this will not do with Alaska. With its rigorous climate, long winters and short summers, with its mountains, morasses and rivers, its extent and remoteness, neither individuals nor small parties, nor yet large companies, are equal to the task of exploring this vast and gloomy region. This is a business that will even severely task the resources of the General Government, if it is to be soon accomplished and with much thoroughness.

The work is one of great difficulty and appalling magnitude. The climate and conditions throughout are about as bad as they well can be. The weather is more or less stormy most of the year, frequent and heavy rains in the summer and deep snow falls during a good part of the other months. The cold is intense, ice forming on the lakes and all but the larger streams to a great thickness. The distances to be traversed are frightful to contemplate. The Prihyloff Islands, the center of the seal fisheries, lie 500 miles to the westward of the Alaska Peninsula, which in turn is a thousand miles west of the long coast strip, site of the gold mines now being worked. But this strip, though nearly a thousand miles long and comprising an area larger than all the New England States, constitutes a mere outlying fragment of the main Territory.

This distant province is becoming an important portion of the republic. The exports for the past year amounted to $10,000,000, $2,000,000 of which were gold. The output of the mines will be likely to increase rapidly hereafter, coal, lead and copper coming in to supplement the product of the precious metals. After a time lumber will be exported and possibly ice, the curing and canning of fish expanding meantime into an immense industry.

In view of such probable growth, the boundary line between this country and British Columbia should be ascertained and fixed as soon as practicable. A regular form of government should also be provided for the Territory, to the end that the inhabitants be enabled to enact such local laws as may be needed and otherwise manage their home affairs. Alaska is worth looking after and should in no vital particulars be neglected by the General Government.

The Money Panic and Its Lesson.

The past week the money centers of the world have been rocked in the throes of a stock panic that has not had a parallel for nearly two decades. The panic has been sweeping in its effect, affecting to a greater or less extent every industry. It carried in its wake the fortunes of many thousand persons, besides tottering to their very verge many moneyed institutions whose previous financial standing was firmly set in the confidence of all classes. One of these, Baring Bros. of London, England, after weathering the blast of many financial storms, was made the past week to bend in submission to the irrevocable, and had not assistance been rendered by leading banks in Europe, their failure would have followed. Such a calamity would have drawn many more into the abyss. As an example of the effect of the panic, it is authoritatively stated that the shrinkage in the value of securities held by Baring Bros. within a few short hours was over $50,000,000.

Conservative and well-informed readers of the signs of the times have looked with discredit upon the situation abroad, and held to the opinion that it could only be a question of time when a reversal had to set in which would financially swamp all who had not prepared for the worst. Speculation, particularly in England, has been rampant. Any scheme placed before the public with glittering generalities was easily floated. Trusts, syndicates, and all conceivable schemes were hatched by designing persons, and made attractive by pointing to fictitious profits. Speculation was not confined alone to private enterprises, for several countries, seeing a rare opportunity to float bonds and other securities, placed large quantities at such attractive prices that they were readily absorbed. It was the carrying of these securities that caught the old conservative house of Baring Bros.

While the many lost fortunes are to be deeply deplored, yet they leave a lesson that is easily mastered, viz.: There is not enough metallic currency in the civilized countries to safely conduct the large and constantly growing international commerce of the world. Of course the above assertion refers to mono-metallic currency. There can be no longer the question of a doubt but the stand taken by farmers, as expressed individually and through their organization, in favor of bimetallism, is thoroughly correct. The scarcity of money, based on a gold standard, has proven a magnet to draw high rates of interest to the moneyed few, besides allowing large unscrupulous speculators to successfully run corners and deals to the detriment of legitimate business and financial loss of the many engaged in farming or other industries.

It is to be hoped that at the next session of Congress the lesson of the times will be heeded and the free coinage of silver become a law. This country is rich enough in all the elements that go to constitute a leading nation to take the lead in favor of bimetallism and let other countries follow, which they will do, convinced by our prosperity that it is to their best interest.

Some of the Benefits California Derives from Mining.

It is calculated that there are 30,000 men engaged in mining for the precious metals in California, this being aside from some 6000 or 8000 who find employment in such branches of mining as relate to the production of copper, coal, salt, quicksilver, petroleum, borax and various other mineral deposits now being utilized in different parts of the State. The value of these several products, gold and silver included, amounts to hardly less than $20,000,000 per annum, the number of miners, as above stated, representing a population of about 100,000 souls.

Suppose now this entire mining industry were extinguished—suppose these miners distributed over the State were to engage in other pursuits and California, instead of producing all the salt, borax, quicksilver and most of these other commodities that she requires, were to import the same from other countries—has any one stopped to think what a difference it would make in the industrial condition of the State? If only gold and silver mining were destroyed and those engaged in it forced to seek employment in other pursuits, what widespread ruin would ensue. What would our farmers, stock-raisers and fruit-growers think of having 15,000 or 20,000 workers added to their number, the markets for much of what they raise being at the same time cut off? What a fatal difference it would make to the cultivators of the soil, this converting so many consumers into producers of the things they make and raise.

With their vocation abandoned or wiped out, what multitudes of these miners would become mechanics and artisans or enter the ranks of the day laborers, competing with those who are now seeking to make a livelihood in these various callings! What impoverishment and distress would such event entail upon not only the wage-earners, but upon the farmers and other producers as well!

It is time that all classes in California should give proper consideration to the importance of mining, reflecting how much of their prosperity is due to this. Poor everywhere are the countries that are lacking in mineral resources or in which their active development is neglected, the Chinese and other Oriental peoples being evidence of this. The advancement made in this industry measures more accurately than anything else a nation's progress in wealth, civilization and power. Let our economists, legislators and all others give due heed to this.

THE world's annual production of salt is 7,300,000 tons, of which England produces the largest amount.

Cinchona Cultivation in India.

[Written for the PRESS by LORENZO G. YATES, F. L. S.]

From the Annual Report of the Government Cinchona Plantations in Bengal for the year 1889-90, we learn that at the end of the year the number of cinchona trees of various ages under cultivation at the plantation amounted to 4,682,401 and a nursery stock of 264,000 seedlings.

The crop of bark collected during the year amounted to 304,705 pounds, from which was manufactured 6393½ pounds of febrifuge; 1252 pounds of quinine, and 34 pounds of crystalline febrifuge which was distributed to the various medical depots and Government officers and upon which the Government realized a handsome profit—the result of careful and skilled cultivation and management by the superintendent and his associates.

Santa Barbara, Nov. 12, 1890.

The World's Coal and Iron.

Investigations made by Mr. G. G. Colcholm of the rates of increase in the amount of coal production in different countries have developed some interesting facts, says the Virginia *Manufacturer*. Since 1860 the rate of expansion has been less rapid in the United Kingdom than in several other countries, notably the United States and Germany. If the same average rates of expansion were continued indefinitely in the future for the United Kingdom, the United States and Germany, respectively, as are found by calculation to have been maintained for these countries between the mean of the three years 1879–81 and the mean of the three years 1886–88, then the coal production of the United Kingdom would be overtaken by that of the United States in 1894, by that of Germany in 1928, and by the aggregate coal and lignite production of Germany in 1919. A similar examination of the rates of growth of the production of iron shows that in this industry these two countries appear to be gaining still more rapidly upon the United Kingdom. This is important as tending to bring about a diminution in the rate of increase in the demand for British coal.

Hitherto the industry of the chief industrial countries has been greatly stimulated by the rapid extension of railways. An examination of railway statistics since 1840 shows that the new mileage required year by year all over the world has increased on the average at a pretty high geometrical rate. This is brought about by the construction of railways on a great scale in different parts of the world successively. Regions in which railways have long been laid show no such rapid increase in the amount of new mileage. This leads to the conclusion that sooner or later a time will come when the rate of increase of the railway mileage of the world will be greatly reduced. That would probably involve a pretty severe check to the growth of the demand for iron, and indirectly that of the demand for coal.

THE newly started industry of shipping salmon East on ice is meeting with great success. Both the Williams and the Pacific fish companies are sending a large amount daily.

THE Billings & Spencer Co. of Hartford use up eight tons of copper a month in making commutator bars for dynamos.

Recent Additions to the State Mining Bureau.

The following additions to the cabinet and museum of the State Mining Bureau have recently been made, some through donations or purchase and others through the efforts of the State Mineralogist in person, or of his assistants in the field:

Epsomite (hydrous sulphate magnesium), crystallized, Napa Co., Cal.; J. Z. Davis.

Diatomaceous Earth, Redondo Beach, Los Angeles Co., Cal.

Wire Gold, from the White Bull mine, Oregon; Melville Attwood.

Chalcopyrite (sulphide of copper and iron), 500-foot level of the Union mine, Copperopolis, Calaveras Co., Cal.; A. Ogden.

Ottrelite, a variety of chloritoid (hydrous silicate of aluminum and iron), Yreka, Siskiyou Co., Cal.; M. Carrick. First occurrence of this mineral in California.

Petrified sandstone, surface carbonized. From the Wealden clay of the Lower Cretaceous Period, near Hastings, Sussex, England; W. L. Watts.

Eudialyte (silicate of zirconium iron and sodium), Hot Springs, Arkansas.

Mixite (hydrous arseniate of bismuth and copper), Copperopolis mine, Tintic D., Utah.

Cyrtolite (a variety of zircon), Llano Co., Texas.

Half real of Augustine Iturbide, first Emperor of Mexico, 1822, and demi of Maximillan, 1864; C. F. V. Peterdorff.

Manganese ore (pyrolusite), Greenwood, El Dorado Co., Cal.; Alex. Keiler.

Copper ore, from ranch of H. Laurence, near Junction City, Trinity Co., Cal.

Garnet rock, Weavertown, N. Y.; M. Braverman.

Cement rock, Suisun valley, Alameda Co., Cal.; Pedro de Salazet.

Sandstone, Diamond Quarry, Utah Territory; J. R. Walker.

Oak, resembling the Irish "bog oak," being a piece of a canoe of the ancient Britons, found at the bottom of Loch Leven, Scotland; Jas. Sullivan.

Magnetite (carb. magnes.), near Yountville, Napa Co., Cal.; R. E. Towle.

Serpentine with vein pyrolite, mother lode, Amador Co. Cal., Dr. Boyson.

Besides the above, more than twice as many other specimens have been added to the cabinet of the Mining Bureau during the past two weeks, denoting for this collection a rapid growth, many of the specimens so gathered in being of great interest both in an economic and scientific point of view.

WIRE is now manufactured of iron, copper or brass, by a new and greatly improved process and at a considerably reduced cost. The machine devised for this purpose consists of a series of rolls in a continuous train, geared with a common driver, each pair of rolls having a greater speed than the pair preceding it, with an intervening friction-clutch adapted to graduate the speed of the rolls to the speed of the wire in process of rolling. The entire operation of producing the smallest sized wires from rods of one-half inch is done cold. It is alleged that this method obviates the danger of unequal annealing and burning in the furnace. In addition to this, the wire, being more flexible and homogeneous than that made by any ordinary method, is capable of greater sustaining longitudinal strain.—*Industrial Gazette.*

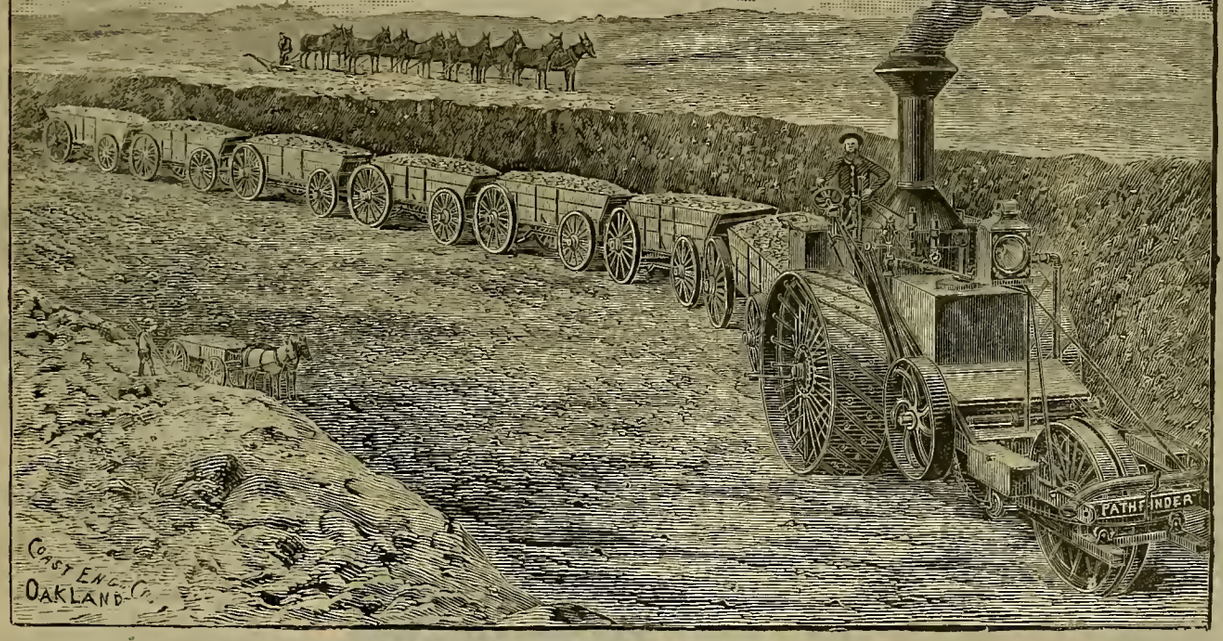
Best's Traction Engines.

During the last ten years the trend of population has been toward our villages and cities. The increase of this population, as compared with the growth of the country, has been far beyond anything in the history of our nation. It is an economic question that has given food for thought to our political economists and statesmen, and as yet they have found no remedy to change the status of affairs.

With the growth of the villages and cities it has invited a spontaneous effort to adopt sanitary regulations and improvements and attractions that should make city life conducive to longevity, and with the advantage of schools and associations, it seems that this system will continue to enlarge rather than diminish.

The city of Sacramento is built upon a level plain, and during the winter months the streets have been almost impassable on account of the sticky, adobe mud. Recently, by an almost unanimous vote, a large amount of money has been appropriated to make the road-beds and streets of Sacramento equal to, if not superior, to any city on the coast. Fortunately for them, about four miles out is one vast gravel-bed made up of pebbles from the size of a walnut to a hen's egg, without any boulders and with just enough dirt intermixed to form a cement that makes a road-bed that is always firm in wet weather and smooth and well adapted for carriage driving.

Recently the trustees have employed all the teams they could hire to improve the streets, but finding the old method too slow, they have called into requisition the services of "Pathfinder," one of the traction engines built by Daniel Best.



BEST'S TRACTION ENGINE HAULING GRAVEL.

The accompanying cut is a good reproduction from a photograph taken at Sacramento while at work in hauling earth from the gravel-bed, four miles out from the Capitol City. This train is run night and day, making from six to seven trips at a cost so low that the authorities are contemplating the project of gravelling the streets generally in the city.

We quote the following publication concerning this valuable invention:

It was declared at the late California State Fair, held in Sacramento, after a three days' plowing contest, that the Best traction engine has no superior, the first prize of $500 having been awarded to its inventor and manufacturer, Mr. Daniel Best of San Leandro. Up to the year 1887, field locomotives had been partial failures. It is to the credit of Mr. Best that, of twenty-five or thirty engines built at his manufactory in San Leandro, each one has been in continual and practical use ever since. He has recently received three orders for engines to work in the Sierra Nevada mountains, hauling lumber, ore, etc. One of his machines has invaded the Sandwich Islands, where it is engaged by day in plowing sugar and cane fields, while by night it runs a dynamo at the factories, for the purpose of furnishing electric light. In Sacramento his premium engine, "The Pathfinder," is employed in hauling gravel to pave the streets of the city. During the fair his engines were used to convey people to and from the park. We quote the following from the State Fair Daily 1890:

"Have you seen the Best steam harvester in operation on the vacant lot adjoining the pavilion? If not, attend to the matter at once and you will witness one of the grandest sights of the nineteenth century. You will see a mammoth traction engine, with a huge combined harvester attached, rushing about, now turning sharp curves, now backing as swiftly as it moved forward, now stopping suddenly, now starting, now reversing with as much ease as a locomotive, and in general exhibiting all the traits necessary to the complete success of a steam traction engine. Crowds are daily witnessing this great spectacle. Best's steam harvester may be utilized as a stationary threshing outfit by simply bringing the machine to a standstill whenever desired, and throwing in the material to be threshed. It will plow and harrow, haul grain, lumber, wood, coal, ore, etc.

Winter Protection for the Vedalia Cardinalis.

On page 331 of this issue we give an illustration of the glass houses erected at San Gabriel by the State Board of Horticulture for the winter protection of the *Vedalia cardinalis*, the ladybird imported from Australia to destroy the cottony cushion scale that was doing such great injury to our citrus groves. The following description of the houses is by B. M. Lelong, the secretary of the State Board of Horticulture:

The winter of 1889–90 was a very severe one upon the increase of parasitic and beneficial insects, as it rained almost continuously until spring. This was the vedalia's first winter in California, and grave doubts were entertained as to their living through it. In early spring (1890), it looked very much as if they had died out, as neither the larva nor the beetles could be found; but a few weeks of warm sunshine caused them to multiply, and our hopes were gratified by discovering thousands of the larvæ at the various places where they were put, with due precaution, late in autumn and before the wet weather had set in. From these pieces, all infested orchards throughout the State have been supplied with colonies.

The board, at its meetings Aug. 14, 1890, resolved unanimously to at once erect two glass houses, covering large orange trees, where the destructive cottony cushion scale (*Icerya purchasi*) can be thickly colonized, and at the approach of inclement weather place a few of the *Vedalia cardinalis* in one of the houses, reserving the other for later use should the first become overstocked. In this manner the board hopes to preserve this wonderful insect to the fruit-growers of California.

This course was prompted by the experience of last winter. In the spring it was almost impossible to find a living specimen, and as the cottony cushion scale reappeared in a number of groves where it was supposed to have been exterminated, having passed through the winter under the ground at the collar of the tree, under a weed, or in some way secure from the attacks of the vedalias, at the approach of warm and congenial weather, the scales hatched and developed with such rapidity it created considerable alarm among orchardists.

The experience of the past few years was too fresh to again allow the scale to become established. The Icerya is now very scarce, and the possibility of the vedalia passing through the winter months is now reduced to a minimum.

The board has had erected at San Gabriel, Los Angeles county, two glass houses, a good idea of which can be had by reference to the accompanying photo-engraving plate. They are at the orchard of Col. J. R. Dobbins, and are octagonal and so designed that they present a good surface to the sun, and are thereby warmer and more suitable for the propagation of both scales and ladybirds.

The dimensions are each 16 feet in diameter by 18 feet in elevation; every part is well fitted, and the ventilation protected by very fine brass-wire mesh, to guard against the entry of any ladybirds before the cold weather sets in, otherwise the scales would be destroyed by them early in the season; and also to prevent the ladybirds from escaping during the time they are being colonized for distribution in the spring.

Many are of the opinion that this most important foe to the baneful icerya "has come to stay," but there are no facts upon which to base such an opinion, beyond the fortunate results of the past winter, when they passed through it unprotected. There is too much at stake, and the risk of them dying out is too great to allow this to be again repeated. It is to prevent all possibilities of a failure that these precautions have been taken.

THE Messrs. Colt, Hartford gun-makers, gave $1,000,000 for the right to make in the United States, Gifford's new carbonic acid gas gun, which kills at 600 yards. This is expected to revolutionize gun manufacture and the art of war. "The more fearfully destructive war is, the more unlikely."

CHICOPEE will be greatly benefited by the starting up of the bicycle manufactory of the Lamb Knitting Machine Company, as they will employ about 200 hands.

Founded by Mathew Carey, 1785.

Industrial Publishers, Booksellers and Importers,
810 Walnut St., Philadelphia, Pa., U. S. A.

☞ Our new and Revised Catalogue of Practical and Scientific Books, 86 pages, 8vo., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the arts, sent free and free of postage to any one in any part of the world who will furnish his address.

A LIBRARY FOR $1.00

Five books in one. Worth its weight in gold to every mechanic. The very latest information for 20 different trades. This wonderful book contains 575 pages absolutely teeming with rules, tables, secret processes, and new information that cannot be had elsewhere for less than $25.00. The Model Steam Engine—How to Read an Indicator—The Westinghouse Air Brake—Blacksmith and Machinist's Tools—Practical Mathematics Simplified—Tin and Sheet Iron Worker's Manual—Carpenter's Manual—Points for Painters—Magnetism and Electricity—How to Get a Patent—A Mechanical Dictionary. Everything fully explained in one handsome volume and guaranteed to be absolutely correct. Send $1.00 for a copy bound in silk cloth, or $1.50 for Morocco binding. With each copy of the book we give free a complete working chart for setting gear teeth. The regular price of this chart is $1.50. AGENTS WANTED. Write for terms. LAIRD & LEE, Publishers, 203 Jackson Street, Chicago, Ill.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 1000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHECK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

The Best Mining District

On the Pacific Coast!

GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is

THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

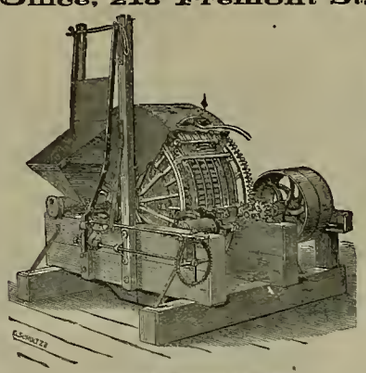
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

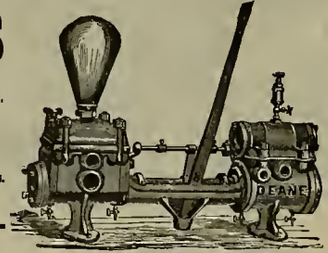
Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.



DEANE STEAM PUMP.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling,

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. **GENERAL AGENTS, SAN FRANCISCO CAL.**

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Of all kinds made to order. Send for Descriptive Catalogue. 17 and 19 Fremont St., San Francisco

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap, do us the favor write again.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vannor & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS HORIZONTAL, VERTICAL AND SECTIONAL.

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

Ore CARS, Water & Ore BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

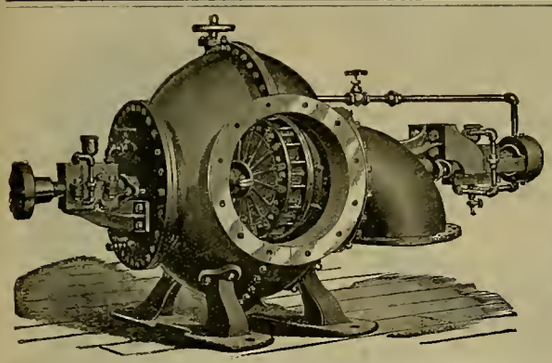
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 20, 1890.

General trade the past week was fairly active for the season of the year. The local money market worked closer under free remittances to the East and a fairly active call for funds to take advantage of the decline in stocks. Two or three stockbrokers failed, while several more were forced to unload some of their holdings. This is about the only inconvenience or disturbing effect had on our market as a result of the stock panic in London and New York.

MEXICAN DOLLARS—The market is dull and heavy at about 81c.

SILVER—The Department at Washington purchased on Nov. 17th 745,000 ounces at $1 to $1.005 an ounce, and on the 19th, 500,000 ounces at $0.971 to $0.9825 an ounce. With the latter purchases the 4,500,000 ounces for the month were secured. No further purchases will be made until December. The silver markets abroad and at home suffered severely by the stock panic and consequently close money market at the East and in London. From all we can learn, many holdings were forced on the market and into stronger hands. It is also said that there is quite a short interest on the market, not only in silver but in all securities based on the market value of silver. If this proves to be correct, then it will be only a question of a short time when the price will go up again, but it is not likely, unless we have more favorable legislation, to go as high as it did in the early summer months. Telegrams received to-day from New York report market quotations at 98⅛ cts. In this city there is no demand except at lower prices than holders are willing to submit to.

QUICKSILVER—Receipts the past week aggregate 310 flasks, and exports by sea 194 flasks to Mexico, In October, rail shipments overland aggregated 81,330 pounds. The market is fairly active at easy prices.

BORAX—Exports the past week aggregate 21,090 pounds to New York. In October, the overland shipments aggregated 8265 centals. The market is steady at current quotations.

ANTIMONY—In October, 20,000 lbs. were shipped overland. The market is barely steady.

LIME—Receipts the past week aggregate 3963 bbls. The home demand continues free for the season.

IRON—Imports the past week aggregate 410 tons from Oregon. The market is fairly steady, kept so by the absence of a marked selling pressure. Foreign advices report the markets temporarily affected by stringent money markets, making reliable quotations difficult to give. Eastern mail advices report the tone steadier.

TIN—The spot market for both pig and plate is dull and barely steady. Heavy consignments of the latter are on the way, in order to get advantage of the present tariff before the high duties take effect. The European market is unfavorably affected by the decline in silver.

LEAD—The local market has an easier tone, although no lower quotations are given. The market at the East has been steadily declining during the past week.

COPPER—The market is reported unchanged. At the East, large holders are reported firm. Concessions are only obtainable from outside sellers. The *Iron Age* cablegram report is as follows: In copper there has been a large business, and prices, after declining somewhat sharply, turned for the better, with £5 7s paid for merchant bar prompts. The early decline was caused by dearer money and realizations by outsiders, There has also been considerable selling on "bear" account, but the market has received influential support the past few days. Consumers are buying moderately.

COAL—Imports the past week aggregate as follows: Swansea, 1840 tons; Nanaimo, 1268; Coos Bay, 1350; total, 4458 tons. Australian advices report the sailing of one or more vessels, and that other vessels are loading. Selling offers for January shipment are on the market at $8.75 without finding buyers. It now looks as if the local market has seen its worst. Had heavy rains set in early this month, prices would have been quite high, but the rain holding off so long has caused dealers to believe that it will not be advisable to put prices up, even if it does rain soon. Heavy shipments of coast coal are on the way to this port.

Mining Share Market.

Comstock mining shares held fairly steady on Thursday, Friday and Saturday, but since Monday the Gold Hill stocks have sold at lower prices in sympathy with a drop in Confidence of over 40 per cent. This is one of the usual deals that have been given of late years on Senator Jones' return from Washington. The Middle and North End stocks shaded off only slightly. Those in position to know affirm with the utmost confidence that an ore development was made in one or more of the Gold Hill mines a few months since, and that the depression in the market has been made to get in stock. Be that as it may, the lower prices have undoubtedly uncovered large lines of stock. Who bought, each dealer must be his own judge; but there is one thing quite certain: the public was too badly crippled to buy much. Several brokers were hurt by the decline, and to save themselves from ruin, had to sell considerable stock. Their selling kept the market down. It is claimed that with another 10 to 25 per cent decline, more stocks can be uncovered, but the question is, will manipulators by the decline lose more stock than they can gain? It looks as if persons who buy now and pay for the stocks and will not be alarmed if prices set off some more, will come out considerably ahead before the spring months. No sensible person will or should buy on a margin.

In outside stocks dealing has been confined chiefly to Bodie, which fell to 65c, then rallied some, but is again weak. A shipment of about $16,000 is expected from the mine. The mill has not shut down but is running smoothly. The Tuscaroras have held firm. Important development work is being done in Commonwealth, North Commonwealth, and two or three more of the mines. If the price of silver recovers, these stocks will come to the front as a good investment.

The two organs continue to keep Potosi as an object-lesson, as if the market hinged on it. It would be a surprise to the better informed if Potosi's shares do not make quite a break before long. Of course this depends on the success manipulators meet in selling stock. An assessment will have to be levied soon.

One of the most important events of the week was the interview had by a director in the Confidence Mining Co. with Francis G. Newlands. In the conversation Mr. Newlands expressed a wish to meet leading members of the Mining Stock Association, in order to talk over the mining situation on the Comstock, hear their complaints, and, if in his power, right the wrongs claimed to exist in mine management on the lode. Mr. Newlands no doubt has considerable opposition to contend with in bringing about any measure calculated to benefit stockholders, for he incidentally mentioned that a large owner in the Comstock Mill & Mining Co. seriously objected to the reduction of one dollar a ton in milling ores. This reduction Mr. Newlands made several months ago.

News from the Comstock mines is still hard to get—that is, for publication. We can affirm without fear of contradiction that the situation on the lode never promised better results for stockholders. The various works going on in the mines are nearing important objective points. In Hale and Norcross and Savage, important new crosscuts have been started, as there also have been in several other mines. From the outside mines the news is of a very encouraging character, with reports of new strikes in some of the Tuscarora mines. In the Quijotoa district, the mining news is encouraging. From the Bodie district the official letter received to-day reports that the mill will start up on the company's tailings. Some say that more bullion will be extracted from the tailings than from the ore when first milled. Active and important prospecting work is going on in the mine, as there is also in Bulwer. Private advices report an important strike in Bulwer. Perhaps that is why the Bodie and Mono stocks broke—to buy up Bulwer at lower prices.

Eastern Metal Markets.

By Telegraph

NEW YORK, November 20.—The following are the closing prices the past week:

	Silver in London	Silver in New York.	Copper.	Lead.	Tin.
Thursday	.47 5 16	1 02¾	$16 75	$5 12½	$20 90
Friday	47⅜	1 02¾	16 75	5 00	20 80
Saturday	47⅜	1 02	16 75	5 00	20 60
Monday	.46	1 00	16 50	4 95	20 30
Tuesday	.45	99⅛	16 50	4 85	20 10
Wednesday	.45	99⅛	16 50	4 75	20 10

NEW YORK, November 13. — BORAX is fairly steady. Quicksilver is dull and easy. Tin continues to set off, under lower prices for silver and money panic. The same cause affects copper, notwithstanding the statistical position is in favor of holders.

Patent Hoop-Clamp for Tanks.

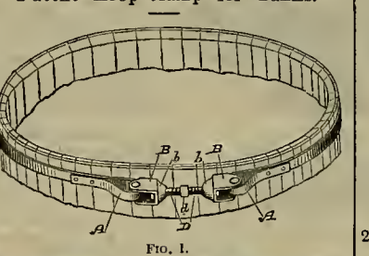

FIG. 1.

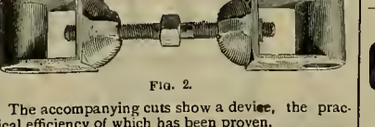

FIG. 2.

The accompanying cuts show a device, the practical efficiency of which has been proven.

A in Fig. 1 are the hoop ends, which are looped around the cylindrical outer ends of the heads *B*. The inner or adjacent ends of these heads are formed with hemispherical seats *b*, and in these are fitted hemispherical nuts at liberty to move in their seats.

D is the adjusting or tightening bolt of the clamp, having one end provided with a right-hand thread and at the other end with a left-hand thread, and at the center with a collar or wrench-hole, *d*. The threaded ends of this bolt pass freely through elongated apertures in the seats of the head and are connected with the hemispherical nuts in the sockets. An enlarged view is shown in Fig. 2.

The operation of the clamp is as follows: The ends of the hoops are looped around the heads as shown and then a wrench is applied to the central collar, *d*, of the tightening bolt. The bolt is turned and as its reverse threaded ends work in and through their respective nuts the heads are drawn together, thereby tightening the hoop. The strain being in a curve, deflects the heads from a straight line, the hemispherical nuts through which the bolt passes turning in their hemispherical seats in the proper direction to enable the clamp to conform itself to the curvature of the hoop, thereby exerting its strength in the line of said curve instead of in a straight line tangential to it. As before mentioned, the nuts will remain steady in the direction of rotation of the bolt.

This invention supplies a great want, particularly in dry and hot climates, where shrinkage of lumber is considerable. No device heretofore in use for the purpose of tightening hoops has been satisfactory, for the reason that the draft was not straight and therefore not direct on the hoops. The advantage of a clamp hoop over a riveted hoop, particularly in heavy tank work, must be apparent to all. To tighten a riveted hoop requires tools, scaffolding and capable men. It also mars the paint and injures the iron. To tighten with a clamp, working freely, requires simply a ladder and a wrench in the hands of anybody.

Clamp bands are convenient in transportation; heavy bands for large tanks can be handled in sections without folding. Mechanically considered, the device may be described as a right and left draw buckle, acting on ball and socket joints. It therefore works equally free, powerfully and effectually on long or short draft and on large or small circles.

The device has proved a great success and is now being used extensively in the tank-building department of Wells, Russell & Co., Mechanics Mills, cor. Mission and Fremont Sts., S. F.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of October, 1890, an assessment (No. 20) of Six Cents (6c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room 11, No. 303 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of November, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of December, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W BARROWS, Secretary pro tem.

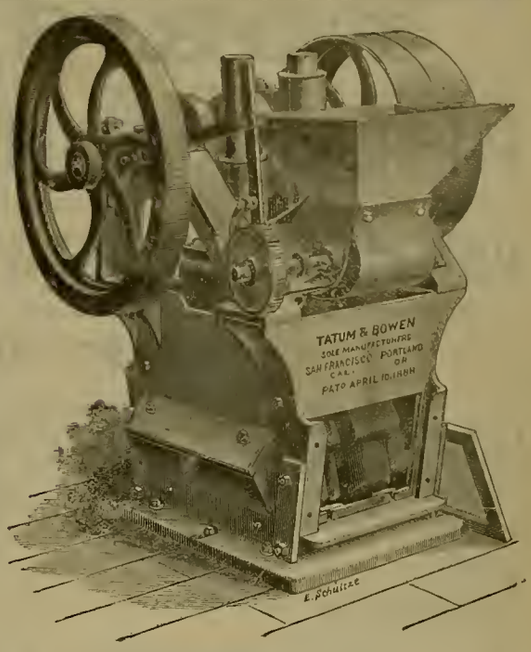
—THE—

PERFECTED DOUBLE Economic Quartz Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

HINKLE'S GOLD ROLLER MILL

Will crush from 15 to 20 tons of hard ore per day and from 25 to 30 tons soft ore. Lubricated by water only. Guaranteed to crush with least wear of any mill in the market.

ENGINES AND BOILERS

Steam Pumps and Irrigating Pumps

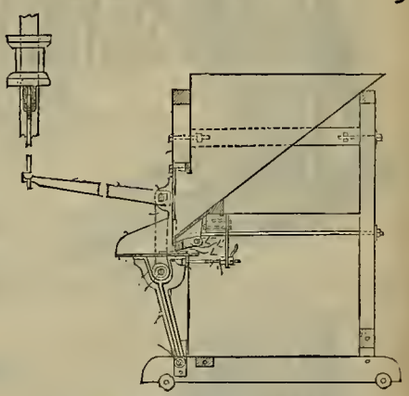
LAUNDRY MACHINERY,

Wood-Working Machinery, Iron-Working Tools,

LEATHER AND RUBBER BELTING.

— AND —

SUPPLIES OF ALL KINDS.



HINKLE'S ORE FEEDER

Will feed Wet or Dry Ore, for either Stamp or Roller Mills.

INVENTORS, TAKE NOTICE!

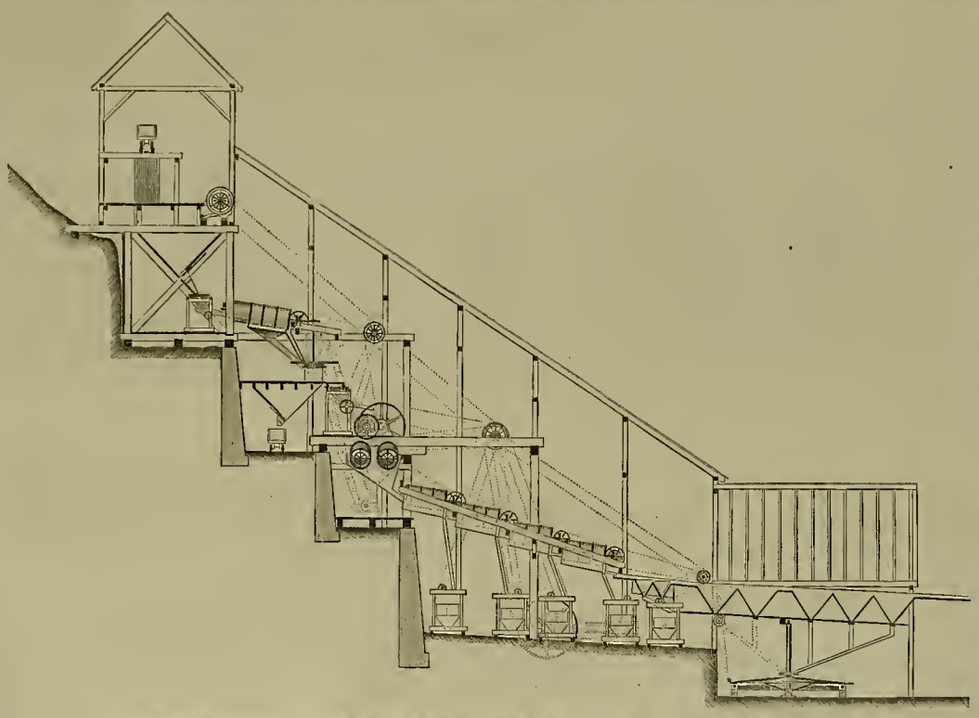
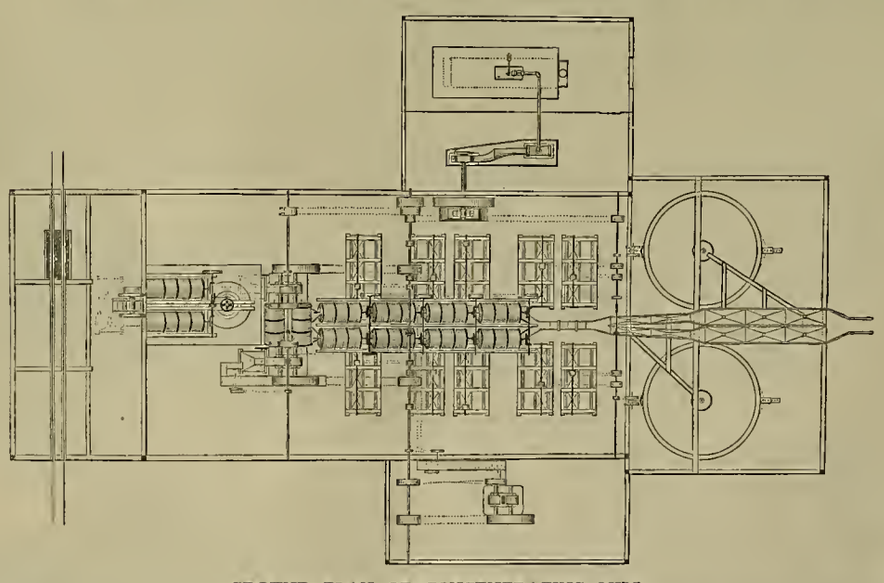
Concentrating Mill.

We illustrate on this page the general plan and arrangement of a concentrating mill for galena ores, it having a capacity of about 150 tons in 24 hours. The real beginning of concentration is in the mine, where by a rough hand-sorting the richer pieces of ore are separated from the poorer and the barren pieces. Further hand-sorting with spalling by means of hammers is often employed before the ore is subjected to any mechanical crushing. After the first crushing in rock-breakers, the ore, thoroughly washed and screened, is frequently again hand-sorted on revolving picking tables. Gradual reduction in size with intermediate screening out will generally prevent much unnecessary comminution of friable mineral and will throw the bulk of the work on the coarser jigs whose capacity is greater than that of the fine jigs. The middle products of the coarser jigs, whose capacity is greater than that of the fine jigs, can be crushed to a finer size and served to finer machines together with the rest of the fine material or can be treated on separate machines.



CONCENTRATING MILL FOR GALENA ORES, BUILT BY FULTON IRON WORKS.



GROUND PLAN OF CONCENTRATING MILL.

In the concentrator illustrated, the ore is brought in cars and dumped over a grizzly, which eliminates the portion finer than the intended crushing by the rock-breaker, to which only the coarser part is fed. The rock-breaker product drops into a bin terminating below in a self-feeder which supplies the wash trommels in a continuous and regular manner. The wash trommels are revolving drums about 8 feet long, the lower two-thirds of whose length consists of screens with 1 inch or 1½ inch openings. All material passing over this screen is guided through a discharge spout and on to the revolving picking table, where it is subjected to hand sorting, the richer portion being thrown through central apertures of the table into bins below, and from which it is removed as finished product. The poorer portion remaining on the table is removed by a fixed scraper and falls to the self-feeder, and thence into roughing rolls, which would be set to crush 1 inch or ¾ inch, depending upon the character of the ore. The material which passed through the openings of the screen on the wash trommels also goes to the roughing rolls if these are set to crush to a finer size than the screen, otherwise, together with roughing-roll product, the material passes to the trommels shown directly below the rolls. The screens in these trommels have openings of ⅜ inch or ¾ inch and determine the coarsest size of material to be worked on the jigs. The unscreened material from these trommels falls into an elevator which delivers it to self-feeders and thence into finishing rolls, which are set to crush to the mesh of the screens on trommels immediately below rolls. The screenings of these trommels, together with the crushed product of the finishing rolls, goes to a double line of four trommels which classify the material into four jig sizes, the end or over-discharge of the trommels being served to the eight jigs shown in plan. The screenings of the last and lowest trommels flow to a system of two hydraulic separators which separate the material into two sorts served to the jigs at each side. The overflow of the last hydraulic separator goes to the point boxes below which are prepared two sorts of material respectively for the buddles.

The middle products from the coarser jigs are diverted to the middling rolls in the room to one side of main plant for finer crushing, so as to further unlock the mineral in the mixed grains, after which they are raised by an elevator and sluiced to trommels, and thence again distributed to finer jigs. In large mills, separate trommels and jigs are often provided for this purpose. This, indeed, will be necessary in case different valuable minerals are to be separated from each other.

In some mills close sizing before jigging is not resorted to, and the jigs are called upon to handle a wide range of sizes. In some cases this is attended with good results, but generally the tailings require rejigging. For small plants close sizing and gradual reduction may be commercially inadmissible. All jigs require great uniformity of speed and water supply in order to do good work. All water pipes in a concentrator should be of ample size, so that the adjustment of supply to any machine will not affect that to another and disturb its work. The mill illustrated is taken from the designs of the Fulton Iron Works of this city, who are making a specialty of this class of machinery.

NEED NOT WORRY ABOUT THE RAIN.—Not because the fall rains have been delayed nor yet because the recent signs of their near advent proved disappointing, must it hastily be concluded that we are destined to see a dry winter. There are no unerring nor even tolerably reliable signs of either a wet or a dry winter in California. The fall of 1850, which preceded the driest winter of which we have any authentic record, acted much like the present one; yet this goes for nothing, in view of the fact that just such autumn weather has sometimes preceded our very wet winters, one of which may now be awaiting us just as likely as any other. We need not, therefore, borrow trouble about the prospective winter. Be it what it may, we shall not in this State with our much irrigated land and so much water stored in the mountains suffer any great shortage of either our gold, our grain or our fruit crops.

HOW IT WORKS.—Encouraged by that feature of the McKinley bill relating to the importation of lead ores, the smelting business throughout the central and the northwest mining regions has been greatly stimulated, new furnaces being erected and the idle ones everywhere started up; so also with the mines themselves. New claims are being opened and the old ones worked with greater vigor. With so much activity, miners are in demand and generally at enhanced wages, from $3 to $4 per day being the ruling rates paid.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Disposition of the Hydraulic Tailings.

EDITORS PRESS:—At Cherokee Flat, Butte county, where is located the property of the Cherokee Hydraulic Mining Company, can be seen what is called in mining phraseology a "grizzly," it being simply a contrivance for segregating the materials on a limited scale, as they come direct from the mine, and consists principally of long iron bars lying at the end of the first section of the flume as it emerges from the tunnel. Enough space is left between the bars for the water and finer pebbles and sands to pass through, but the coarse bowlders are shot out to the end of the bars, when they roll down into Sawmill ravine and there remain permanently. The water and pebbles after passing the "grizzly" are caught up by a flume and carried down a mile or so and dumped into the head of Dry creek. Here the gravel, sand, etc., spread out to nearly one-half mile in width—the finer particles being carried along Dry creek for a couple of miles to a dam located in an admirable place for storage, but not properly kept up to stop as much debris as it should, and from the dam the water and tailings is carried in a canal 25 or 30 miles to the low lands in Sutter county. The canal is 500 or 600 feet in width, with levees and sub-levees six or eight feet above the general surface of the low flat lands bordering either side of Dry creek.

The company saw early the trouble that the tailings from the mine was liable to make, so they bought the land along the line of the canal. It would probably have been better if they had in the first place avoided the line of Dry Creek slough and kept away with the canal line on higher ground, as it is now known that what materials the water contains will move readily in a canal eight or ten feet wide with a grade from five to eight feet to the mile. They would in this case not be troubled with the flood waters of Dry creek and the great expense of keeping up the levee lines. The principal point to be learned here is the ease with which the finer particles from the mine can be handled with a small canal. While in the present line the weeds and willows grow so thrifty in summer, when there is no water except from the mine, that it affords an obstruction and lodgment for the debris—the facts in this case being ocular demonstrations of points I wish to make use of. All hydraulic mines are not similarly situated, but modifications of the general plan below mentioned would have to be made to suit particular cases.

Most of the main hydraulic mines, of which nearly all are enjoined from working, are high up in the mountains. If, at the end of their main flume, they should continue their flume-grade until the vertical hight of the flume should be 50 to 100 feet above the ravine or creek channels, into which most all mines tail, then "grizzly" off all the rocks and gravels, as far as practicable, and which forms the largest proportion of the debris, and let it dump—the water, sands and gravel being caught in a flume and carried to some convenient point, where a reservoir of moderate dimensions could be constructed, when the second precipitation would be made of everything except the very finest particles and of least specific gravity. The latter could then be carried in a ditch until it met a ditch for a like purpose from some other mine, until one main ditch or canal would carry the materials to a settling reservoir of large dimensions. This would practically end the matter so far as the miner is concerned.

Now, for instance, take the case of the Yuba and Bear rivers, the combined tailings could be carried in a pipe over or under Feather river into the low tule lands in Sutter county, where the sediment would be in a few years a great help to the now almost worthless lands. To make a proposition like this practicable would require the concerted action of hydraulic miners, and also the laying out of a general plan for ditches and canals to subserve the purpose of the miners with the least outlay of capital and labor. Oroville, Cal., Nov. 20, 1890.

The Spring Attachment to the Huntington Mill.

Where It Can Be Seen in Operation.

EDITORS PRESS:—A correspondent in a late number of your paper makes some inquiry about the spring attachment to the Huntington Centrifugal Quartz Mill, patented through the agency of Dewey & Co.—your correspondent going on to remark that he has not seen any of those appliances at work, and wishes to know where there are any in use, how they succeed, etc. For the information of your correspondent and others who desire it, let me say they have one of the Huntington mills, with spring attachment, running on the Shaw mine near this place that has been in use for two years past, and with such manifest advantage that it is a matter of surprise to every one who has seen the operations that persons being this style of mill will consent to dispense with it. In working moderately hard ores, like those of the Shaw mine, this spring invention increases the crushing capacity of the Huntington mill fully 20 per cent, and prolongs the life of the steel roller rings double the time it would be without it, as the rings with this attachment wear perfectly round and smooth. Why this device is not attached to every Huntington mill built is something unaccountable, unless perhaps the builder of these mills does not own the patent for this invention, a matter about which I am not informed, though I presume the firm of Dewey & Co., through whose agency it was patented, would be advised as to this. I really think that not another mill of this kind should ever be allowed to leave the shop of the builder without this addition. HORACE F. TRACY.

El Dorado, Cal., Nov. 14, 1890.

Fortunes in Small Inventions.

Every little while the newspapers take up the subject of inventions and tell their readers how many have made fortunes out of small inventions. The Pittsburg *Dispatch* gave, the other day, a list of small things that have made their inventors wealthy. It commences with the pen for shading in different colors, which yields an income of $200,000 per annum. The rubber tip at the end of lead-pencils has already made $100,000. A large fortune has been reaped by a miner who invented a metal rivet or eyelet at each end of the month of coat or trowsers pockets to resist the strain caused by the carriage of pieces of ore or heavy tools. In a recent legal action, it transpired in evidence that the inventor of the metal plates used to protect the soles and heels of shoes from wear sold upward of 12,000,000 plates in 1879, and in 1887 the number reached 143,000,000, producing realized profits of $1,250,000.

A still more useful invention is the "darning weaver," a device for repairing stockings, undergarments, etc., the sale of which is very large and increasing. As large a sum as was ever obtained for any invention was enjoyed by the inventor of the inverted glass bell to hang over gas to protect the ceilings from being blackened, and a scarcely less lucrative patent was that for simply putting emery powder on cloth. Frequently time and circumstances are wanted before an invention is appreciated, but it will be seen that patience at times is well rewarded, for the inventor of the roller skate made over $1,000,000, notwithstanding the fact that his patent had nearly expired before its value was ascertained.

The gimlet-pointed screw has produced more wealth than most silver mines, and the American who first thought of putting copper tips to children's shoes has realized a fortune. Upward of $10,000 a year was made by the inventor of the common needle-threader. To the foregoing might be added thousands of trifling but useful articles from which handsome incomes are derived or for which large sums have been paid. Few inventions pay better than patented toys. That favorite toy, the return ball, a wooden ball with an elastic attached, yielded the patentee an income equal to $50,000 a year, and an income of no less than $75,000 fell to the patentee of the "dancing jimcrow."

The invention of "Pharaoh's serpents," a toy much in vogue some years ago, was the outcome of some chemical experiments, and brought the inventor more than $50,000. The sale of the little wooden figure, "John Gilpin," was incredibly large for many years, and a very ingenious toy known as the "wheel of life" is said to have produced upward of $100,000 profit to its inventor. One of the most successful of modern toys has been the "chameleon top," the sale of which has been enormous. The field of invention is not only vast and varied, but is open to everybody, without respect to sex or age, station or means.

PRESERVATION OF MINE TIMBERS.—The German Government officials, principally at the mine Altenwald, near Saarbrucken, have for 18 months past been experimenting to ascertain the best means to preserve and protect mine timbers, both from decay and from fracture by pressure. In connection with the tests to prevent decay of mine timbering, especially such as is exposed to great pressure, lime, coal tar, tar and carbolineum were tried in such a manner as to enable them to compare their relative protective value. The results show lime to be the weakest. Coal tar preserved the outside of the timber, while the core was found completely decayed. Carbolineum proved by far the best, and is now being used on all the timbering of the upcast in that mine. The mine timbers, made of wood peeled and dried, are twice painted over with the carbolineum above the ground, and require each, when 2.5 meters long and 0.25 meters in diameter, in the first application four-fifth kilogram, and in the second three-fifth kilogram, so that at a price of 34.5 pf. per 1 kilogram, the total cost was: For material, 48.3 pf., and for labor 14 pf., or altogether about 7½d. To prevent the premature breaking of the wall props, after experimenting for some time it was found that when three or four notches, 30 centimeters deep, have been sawed in the top part of the wood, this yields to the pressure by being compressed, but does not break.

THE Winchester Arms Co. of New Haven are to bore another artesian well. In a former attempt they went down 2250 feet without success, and they now propose to go until they get water.

The Gold Belt of California.

NUMBER III.

The Ancient Placers and Their Relation to Wall Rocks.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON, Kernville, Cal.]

I have spoken of a belt one mile wide having yielded a large percentage of gold found in lumps worth more than $1000 each. The belt referred to would extend in length from the town of Sonora in Tuolumne county to the South Fork of the Stanislaus river, a distance of about eight miles. The largest body of gold found in a quartz matrix in this State was in the town of Sonora, at the south and lower end of this belt. The Strain lump was found in the immediate vicinity of the southeast corner of the corporate limits of the then city of Columbia. The piece found by Virgin, West & Co. was found about 40 rods west of the said corporate limits. North of where the Strain piece was found, in Three Pine Gulch, three pieces were found having an aggregate value of more than $12,000. This gulch rises in Summit pass, which overlooks the mining camp of Pine Log, on the South Fork of the Stanislaus. For 20 years there was seldom a week passed that there was not from one to several lumps extracted from this bar which weighed up in the ounces, and certainly more than one was found worth more than $1000 each. Here, on this little belt, was found at last from $28,000 to $30,000, which was in lumps above the size mentioned. The major portion of the underlying formation was lime throughout this whole region.

If this gold was produced in any other formation and was carried there by the current, then we should look higher up the stream for larger lumps. I have before mentioned that in this same lime formation a thin sheet of quartz was found rich in free gold. It may be mentioned further that in several places where there was a contact between lime and what was called "Block Ledge" (a rock too much decomposed for its character to be determined), several bodies of quartz in place carrying free gold have been developed in recent years.

I have called attention to the fact that in several mining camps in the middle and southern placers, the placer gold reposed on the same character of lime formation, and also to the further fact that this gold yielded a higher assay than gold obtained either to the east or west of this line; and to the still further fact that most of the placer gold of this region was dug above the mother lode. If we go to the Willard mine at Murphys on this same kind of a formation, we shall find the gold near the slate of the southwest wall almost chemically pure, while to the east 300 or 400 feet the bullion is by weight seven-eighths silver. In the Bonanza mine at Sonora there is much the most silver in the pockets found near the eastern wall. Now I have thought and have earnestly believed for years that such facts as those I have mentioned might lead us to look for the source of the gold of the ancient placers nearer home than was suspected, and might induce old miners to return and look over the ground again and enable all those who have acquired any knowledge of quartz to view the subject in a new light. With this end in view, I have undertaken the discussion of this subject.

(To be Continued.)

WHY PLATINUM IS GROWING DEARER.—Platinum jewelry is in danger of becoming a thing of the past. The amount manufactured this year is just about one-half of that of last year. For the last six months the price of the precious metal has been rapidly advancing, until now it has made an advance of over 60 per cent of the original price. The demand is greater than the supply, and in a short time the price will be out of the reach of every jewelry manufacturer. The advance is attributed to the large number of electrical works now in operation in the United States. The amount of platinum used in the manufacture of electrical apparatus is enormous. Each electric light contains about six inches of platinum wire, and if the metal is not pure it will not stand the great heat. As the electric light grows more in favor, the demand for platinum is greater, and unless some substitute can be procured, the chances are that platinum will be indeed a precious metal. Platinum is at present worth $14 an ounce, gold $20.70, and silver $1.04. The manufacture of platinum jewelry is more expensive than that of any metal. The ordinary heat of the blowpipe will not melt it, and it has to go through a process which is very expensive, and about 15 per cent is lost in the working.

THE attempt made by the geological survey of Texas to discover lead, zinc and tin ores in paying quantities has so far proven unsuccessful. In the Central mineral region a good many traces of all three ores have been discovered, but not in quantities which will pay to work either. More lead ore, a very fair galena, has been found than either zinc or tin. In Burnet county, on Beaver creek, lead ore has been discovered which assays 43.3 per cent lead. In Llano county two assays of lead ore show 43.34 per cent pure lead and 44.83 per cent lead. Of zinc and tin, only traces have been found, and not enough to justify an assay for it in other mineral specimens. The report of the State Geologist admits, however, that only the "Central Mineral Region" of the State has been worked and some portions of that in the most cursory manner. When all the mineral regions of the State have been worked by the men engaged in the geological survey of Texas, rich discoveries of these ores may be made.

The Amount of Money in Circulation.

The following interesting facts have been produced from the official statement of the United States Treasury Department:

In June, 1878, the population being less than 48,000,000, the money in circulation, according to this official statement, excluding the amount in the Treasury, was $819,201,372, or $17.21 per capita. In 1879 it was $832,355,060, or $17.03 per capita. In 1880 it was $978,770,337, or $19.51 per capita. In 1881 it was $1,119,813,843, or $21.76 per capita. In 1882 it was $1,179,103,651, or $22.33 per capita. In 1883 it was $1,236,301,823, or $22.83 per capita. In 1884 it was $1,243,115,836, or $22.38 per capita. In 1885 it was $1,290,844,522, or $22.61 per capita. In 1886 it was $1,249,489,329, or $21.39 per capita. In 1887 it was $1,317,214,868, or $21.58 per capita. In 1888 it was $1,371,101,722, or $21.84 per capita. In 1889 it was $1,380,405,561, or $21.38 per capita. Last March it was $1,437,216,124, or $22.11 per capita. On September 1, 1890, it was $1,436,062,942, or $22.44 per capita.

It can be seen from these figures that the amount of money in circulation to-day, excluding that looked up in the Treasury, the amount actually among the people in the channels of business, is greater per capita than for any year in the last 12 excepting 1883 and 1885, and it is further evident that the circulation has not materially decreased per capita at any point in this entire period, but has largely increased during the period as a whole, advancing from $17.21 in 1878 to $22.44 in 1890—or about 31 per cent. In other words, the increase of money in circulation is 31 per cent greater than the increase in population.

The statement by the Treasury Department was made up to September 1st. The increase in the circulation last month was unprecedented. Dun's report says on this point: "Never before has there been in any month so great an increase in the circulation or so large a payment of public debt as in the month just closed."

The figures given in this article are official and can be relied on.

Timber Supply vs R. R. Consumption.

The last Bulletin of Mr. B. E. Fernow, Chief of the Forestry Division of the Department of Agriculture, contains important and interesting statistics on the consumption of timber by the railroads. Before fully reviewing this important publication, the following points may be abstracted with profit:

In answer to circulars sent out to railways, it is found that the round total of timber ties in use on railroads in the United States is nearly 516,000,000, and 80,000,000 are annually required for renewals. Including bridges and trestle-work, the annual consumption of timber on railways is computed at 500,000,000 cubic feet, requiring the cutting of the best timber from over 1,000,000 acres of forest land per year. To meet this demand, under our present wasteful management of timber land, the area to be preserved for this purpose would probably exceed 50,000,000 acres, or more than 10 per cent of our present forest area.

As railway managers prefer "hewn" ties and "one to the cut from small trees," the timber consumed by railroads, or 20 per cent of the total annual consumption, is taken from the young growth. Then 60 per cent of all ties are oak, the most valuable of all our timber. Reliable investigation shows that in the Kentucky forests, where 40 per cent of the natural growth is white oak, the new growth of oak is only 5 per cent after the land has once been cut over for ties.

The consumption of pine from the forests of Wisconsin and Michigan is also enormous; and while some of us look to Canada for future supplies, Mr. Fernow points out that Canada, too, is becoming alarmed at the rate at which her forests are disappearing. At the Congress of the American Forestry Association, at a recent meeting at Quebec, Lieutenant Governor Angers, of Quebec Province, said that between 1867 and 1889, 69,600,000 cubic feet of wood were cut down in Quebec alone. In California, in 1889 it is estimated that $25,000,000 worth of timber was destroyed by fire, the greed of speculators, and the efforts of herdsmen to secure pasturage for flocks.—*Engineering News.*

Hoskins' Hydrocarbon Blowpipe and Furnace.

The above apparatus constitutes a very simple, compact, and at the same time complete outfit for the use of assayers, chemists, jewelers, dentists, etc. This plant is meeting with large sales. We are advised of the following recently effected:

Carny & Hand, assayers, Butte City, Montana, complete plant, including a 9x15 muffle furnace.

Butte Reduction Works, Butte City, Montana, two 9x15 muffle furnaces with large blowpipe complete.

Golden Leaf Mining Co., Bannock City, Montana, a complete outfit.

[Written for the Press by James H. Crossman.]

Hieroglyphics on the Desert Food for the Archæologist and Ethnologist.

Having shown how, through the agency of the Silver Valley Land and Water Company's water scheme, a large portion of the Mojave desert can be rendered productive and habitable, we have, it would seem, sufficient evidence to prove that at a comparatively recent period, geologically speaking, this region of country contained a considerable population, and to support a population, there must necessarily have been vegetation. To say the least, we find here evidences of man's handiwork in the sculptured characters to be seen on the faces of a small porphyritic butte standing out on this desert and known as

HIEROGLYPHICS ON A PORPHYRITIC BUTTE IN THE MOJAVE DESERT.

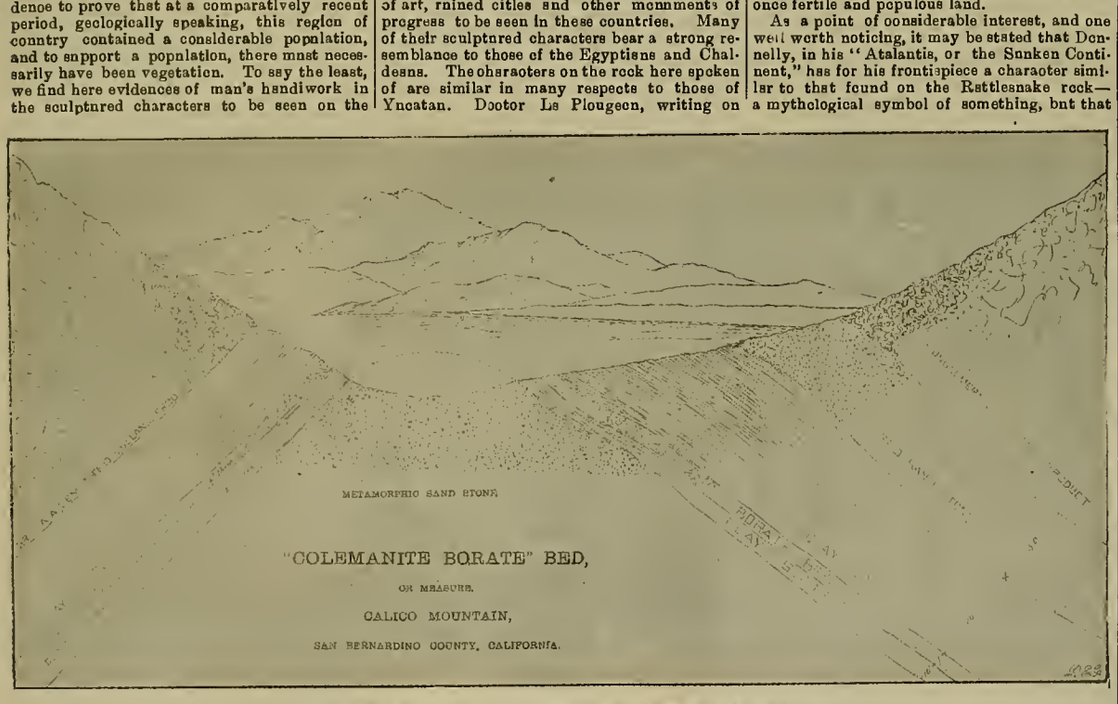
Rattlesnake Rock,

This name having been given it by reason of the immense number of these reptiles that find shelter in this mass of rocks. This butte is situated about two miles north of Daggett and 1½ miles east of the Waterloo mill, standing solitary and alone on the barren plains. It is seldom visited and but little known, not being on the line of travel. It was called to the attention of the writer by Mr. J. Alderley of the Waterloo mine. Visiting the spot, a sketch of the rock and the hieroglyphics engraved thereon was made—the same being represented in the cut herewith given.

The implement used in making these characters was evidently a dull-pointed stone, as the lines are not sharp and the sides of the indentation show marks of striation. That these characters are no erratic figures emanating from the brain of the stupid and ignorant aborigine of the present day, is very evident. They were formed by the hands of a superior race who had acquired the art of recording their ideas and history in symbols and characters, and who possibly may have been allied to the mound-builders that at a remote period populated the American continent from Lake Superior on the north to Bolivia on the south, Yucatan and Central America being the central point of this civilization, which must have been somewhat advanced, judging from the works of art, ruined cities and other monuments of progress to be seen in these countries. Many of their sculptured characters bear a strong resemblance to those of the Egyptians and Chaldeans. The characters on the rock here spoken of are similar in many respects to those of Yucatan. Doctor Le Plongeon, writing on the subject, states that the Mayas in Yucatan used many words and names common to all or nearly all the ancient languages of which we have any knowledge; that they used letters and characters belonging to the most ancient Chaldaic alphabet; and that their mode of writing was similar to that of the Babylonians. He even claims that the continent we live on was the cradle of the world's civilization. Other works of art also exist in this region which are equally as interesting as this sculptured rock.

About six miles from this spot, in a northerly direction, in the Calico range of mountains and two miles east of the town of Calico, an ancient tunnel has been driven into the hill through a granitic rock of a slaty structure for a distance of 180 feet. Some stoping has been done here and a shaft has been sunk at the month of the tunnel 30 feet in depth, the tunnel being 4½ feet high and 3 wide. The implements used in this work, judging from marks and abrasions on the rocky wall and roof, were stone hammers and gads of the same material. The mineral sought for was a peroxide of iron of a brilliant red color, which the people who performed this work undoubtedly used as a paint in decorating their persons and wares. Numerous well-formed stone mortars and pestles were found at the mouth of this tunnel, which was undoubtedly driven by the same race that recorded their history on this sculptured butte, but at a period anterior to the cataclysmic volcanic disturbance that destroyed both the flora and the fauna of this once fertile and populous land.

As a point of considerable interest, and one well worth noticing, it may be stated that Donnelly, in his "Atalantis, or the Sunken Continent," has for his frontispiece a character similar to that found on the Rattlesnake rock—a mythological symbol of something, but that is left for the archæologist to determine. The figure alluded to represents apparently the globe with a serpent or other huge reptile attached to or attacking it.



CROSS-SECTION OF "COLEMANITE BORATE" BED.

Borax Deposits.

On the southeasterly slope of Calico mountain there exists an extensive bed or measure consisting of several varieties of minerals, among others that known as Colemanite. This bed, which is situated seven miles in a northerly direction from the town of Daggett, lies between walls of slate which in turn are underlaid and overlaid by strata of sandstone—the diagram here introduced showing a cross-section of this deposit. This deposit is marked by smooth, well-defined walls—the underlay of the veins conforming to the irregularities of the footwall, while the overlying or hanging-wall is as smooth as the plastering on the sides of a hard-finished room. The color in some places is a pure white, in others a greenish or grayish color. At the point of development the strike is nearly east and west, dipping southerly into a spur of the mountain range at an angle of about 36 degrees. The slate and sandstone combined often attain a thickness of 80 feet. Above this formation is found a stratum of red sandstone, evidently indurated and discolored by heat. This is overlaid in turn by a brecciated eruptive material, evidently ejected from a water volcano. It contains angular fragments of a great variety of stone cemented into one solid mass by volcanic ash, lime and water. The boracic product contained in this vein or measure is crystalline and remarkably pure. Vugs filled with clear prismatic crystals occur, often containing in their centers pure, tasteless crystalline water. The main workings are located on the southerly and easterly slopes of the range and northerly slope of the spur. The vein takes a crescent shape as it follows the rim of the basin in which it occurs, similar to a bedded measure of coal. It measures on the cropping line 14,248 feet, with workings at intervals for this entire distance, with the exception of an intermediate space of 2178 feet, where the croppings are covered by debris and a volcanic brecciated cap. The property is owned and controlled by the Pacific Coast Borax Co., F. M. Smith president and J. W. S. Perry superintendent.

A cord drawn across the arc of the crescent (circle) would measure 11,880 feet.

Developments.

This vein-shaped measure has been well opened at many places on its line of croppings and systematically developed. The developments consist of costean pits, incline shafts, adit levels, etc., exposing immense quantities of the boracic product.

Here are seen large masses of pandermite of a snowy dazzling whiteness, then a Colemanite with its crystalline vitreous luster carrying prismatic crystals that sparkle in the sun like diamonds—showing all the hues of the solar spectrum.

The mine has been most extensively developed at a point near the center of the several locations, and consists of No. 1, No. 2 and No. 3 shafts—the deepest, No. 1, being 249 feet on the inclination of the lode. At this point, water makes its appearance. The main workings are west from shaft No. 3, from which stopes have been extended for 52 feet east. The vein has been stoped from the 211-foot level to the surface. Below this point for 38 feet no stoping has been done. The bottom of the shaft is in good ore, showing a 6-foot vein. Only 12 tons per day are raised from the mine, which is sufficient to meet the requirements of the market. The supply is practically inexhaustible. The mine is well handled by Foreman Perry.

The workings are thoroughly ventilated by longitudinal drifts and winzes connecting the three shafts which are 100 feet apart. The ore breaks easily and it requires but very few hands to supply the demand.

At a point 400 feet westerly from the workings described, the vein has been developed by an incline shaft at an angle of 45 degrees to a depth of 45 feet. Here the vein shows the same general characteristics as in shaft No. 1, in richness, structure, strength, strike, etc. At this point a singular phenomenon presents itself. Immediately across a dry ravine 110 feet distant northerly at a right angle, a vein occurs with a reverse dip of 45 degrees pitching northerly into the opposite hill as shown in the cross-section presented. It is difficult to account for this phenomenon, but it must have been caused either by a sinking of the earth's crust or the bedded measure when laid down must have conformed to the irregularities of the surface, which at that time was all submerged and covered by saline water; or if laid down horizontally, a local upheaval must have occurred at this point, causing a folding of the strata.

The crude boracic product is hauled to Daggett by a 14-mule team carrying from 10 to 12 tons to the load, making usually two trips in three days. The product is shipped to San Francisco by rail and refined at the company's refinery in Alameda.

In my next article I shall have something to say of the Comstock of the South (Calico mountain) and its immense belts of argentiferous ore. Calico mountain is like a sponge that has been thoroughly soaked with water. A large portion of the northerly slope of the range has been so thoroughly mixed with a solution of silver that it is extremely difficult to select any portion that by assay would not show a trace of that metal. That portion of the metalliferous rock that lies in bands, belts and veins, will in the future prove largely remunerative to the mine-owner. It is a well-known and understood fact that Calico has been self-supporting from the start. She has neither asked nor received capital from the outside world, and has made many men moderately rich. The ground was at first believed to contain a system of blanket deposits; then by some of our scientists the defined veins were dubbed cracks in the earth's crust; but continued working and deeper explorations have demonstrated that both vein and ore have been continuous in depth as well as longitudinal extent.

(To be Continued.)

Another Comet.—Tona, at Palermo, discovered a bright comet on the 15th instant.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ON THE MOTHER LODE.—*Ledger*, Nov. 22: Ten stamps of the mill of the Amador gold mine were started last week on ore from the Doyle claim, which is close to the mill. It is the intention to run through 500 or 600 tons, so as to secure a fair test crushing. The ore is said to look well, and the prospects are considered very favorable for a paying yield. Should this rock come up to expectations, it will be a big thing for that section, as there is a large ore body in sight and it can be worked very cheaply. The mill at the McKenzie mine, Irisbtown, has been shut down for several days, owing to the repairing of the flumes of the Volcano canal, which is the source of the water supply. The mill is fixed up to run by steam but they have no wood on hand to enable them to run. At the mine, sinking operations are being prosecuted. At the Gardiner property the mill is kept running steadily on rock from the Union claim, which is thought to be of paying grade. We are unable to give the exact results, everything pertaining to the output of hullion being kept quiet. At Plymouth the mining interests continue depressed. The Plymouth Consolidated employs only a few men in prospecting. The New London is low-grade rock, and is just about paying expenses. At the Clinton Peak the tunnel is in 350 feet. Three veins or small seams of quartz have been encountered, one of them over two feet wide and showing free gold and good-looking sulphurets. The main ledge, however, is believed to he considerably farther in the hill.

Butte.

PAYS BEYOND EXPECTATION.—Chico *Enterprise*, Nov. 21: From several gentlemen over from Oroville last evening we glean the following interesting items of the famous Golden Gate mine near tbere. The whole town of Oroville is wrought up on the subject and golden fancies flit through the minds of every denizen of that booming hurg. There is evidently a hig thing in the above mine and the people believe and the owners know it. Visitors are now prohibited from going into the mine, except to the dam and the end of the flume. Five hundred men have finished the stripping and are now at work on the strictly mining part of the affair. The gravel is paying far better than was at first supposed; on the surface it yielded 25 cents a pan and a little lower tbis increased to $1, with seemingly no present bottom to the richness until bedrock is reached, when $5 to the pan is expected to be realized. Every clear day before the rains set in will he worth a vast fortune in itself, for with 500 men at work and every shovelful of dirt worth a dollar, it is calculated that $500 a minute is thrown nut. It is now predicted that the sum of $10,000,000, which was promised the shareholders, will reach $15,000,000. This stupendous sum taken out of the earth is almost enough to revive the old-time mining craze, but when it is remembered that almost a million dollars was sunk in the project before anything was in sight, the average man will hesitate before going gold-hunting. The presence of so much wealth, and such a number of men in proximity to Oroville, means prosperity to that place, and we trust her citizens will reap a just business reward.

El Dorado.

RUSSIAN DIGGINGS.—*Democrat*, Nov. 22: S. A. Lane is still pushing his tunnel ahead at Russian Diggings, with excellent prospects; his men are working with right good will and hurrowing like beavers to get the tunnel driven as far into the bill as possible before cold weather sets in.

BLAIR GRAVEL.—Considerable work is being done at the Blair gravel mine. A boarding-house and lodging-house are being erected, and as soon as they are ready for occupancy a force of men will be employed to dig a tunnel.

THE VAN MINE.—Supt. Newlands, the millwright and force of mechanics and miners are pushing ahead work on tbe Van mine, a short distance north of town. The ground for the Huntington mill has been graded, the mill and machinery is on the ground and most of tbe lumber. The work of sinking has been begun, and the 600 feet of eight-inch pipe, with 125 feet pressure, will be laid in a few days. The building will cover a space about 25x80 feet. If the 20-foot lode holds out in depth, it will he one of the largest mines in the county, and at least tbree more Huntington mills added.

Inyo.

READING CANYON. — *Independent*, Nov. 14: There are excellent mining prospects in Reading canyon. The place is in tbe Inyo range about six miles south of Bishop Station on the C. & C. road. There is a switch near the mouth of the canyon. Last Saturday A. R. Jones struck a ledge of fine ore, and so far there appears to be a hig body of it. O. H. Hill, proprietor of the Valley View hotel at Bishop, and other parties interested with him, have been operating in the canyon for several months past. They have worked a good deal of ore in an arastra, and the yield has been $90 per ton. The ore contains much sulphurets and this causes heavy loss of gold, tbe tailings, hy repeated assays, showing from $40 to $60 per ton. A few days ago Mr. Hill brought several carloads of ore down to the Maxim mill and is now having it worked there. Mr. Hill says that even with the heavy loss in the tailings they have a good thing in their claim. There is much probability that a mill may be built near the mouth of Reading canyon. Water from the McNally ditch is offered free and also a tract of five acres for a yard and buildings.

IN SALINE VALLEY.—Messrs. Conn and Trudo were at Independence some days this week. They bave applied for patents for over 1200 acres of land in Saline valley; 160 acres of this is a pre-emption and the remainder is horax land.

Plumas.

THE JAMISON MINE.—*National*, Nov. 15: This property is located in the Quartz Mountain district, two miles south of Johnsville, at an altitude of over 5000 feet above the sea level, and adjoins the Plumas Eureka on the north and west. The property comprises several valuable locations upon which there are three distinct ledges, known respectively as the Jamison, Bosco (Soutb Eureka) and Nevill. The course of the vein is north and soutb, dipping easterly at an angle of 75 degrees. The ledge matter between walls has an average width of six feet. The property has been opened by a tunnel following the vein into the mountain about 400 feet, showing a pay chute of ore tbe whole distance. A large quantity of tbis rock has been taken out and worked by the arastra process, which yielded on an average of $8 per ton free gold. The vertical depth from surface reached in tunnel is 60 feet, the present intention of the company being to run the tunnel a distance of 500 feet and sink a shaft. The character of the walls is similar to the Plumas-Eureka—that of the hanging-wall syenite and footwall metamorphic slate. The entire formation, pitch of ledge, formation of walls and general character of the ore are identical with considerable of the rock extracted from the Plumas-Eureka. The mine is situated on Little Jamison creek, a tributary to the Jamison, from which source the Plumas-Eureka obtain their supply. The property was formerly known as the Little Jamison, and in order to open the mine thoroughly and place it among the producing mines of the county, the property was incorporated on Jan. 19, 1887, under the laws of the State. Since the company began operations a large amount of work has been done A flume 1000 feet in length has been constructed from head to outlet for the purpose of carrying the waters of Little Jamison creek, which at the present time flow over the mine. It is 72 feet wide with a fall of 12 inches in 16 feet. The capacity of the flume is sufficient to carry all the waters in the creek. The company has an unlimited supply of water, comprising four natural lakes, the highest being situated at an altitude of 6367 feet. The water is conveyed by a ditch (capacity 1000 miner's inches) 1¼ miles to the mine, giving a pressure of 507 feet, sufficient for all practical purposes. A large number of buildings have been erected upon the property.

Placer.

SOUTH YUBA DITCH.—*Republican*, Nov. 19: The South Yuba Company has a few men working on the old ditch at Gold Run and at other points along the line of the ditch that is to he enlarged and extended in the spring. George Morgan has uncovered $600 in the shaft of his mine on Duncan Hill. The shaft is down about 30 feet.

San Bernardino.

EFFECTS OF THE SILVER LAW.—Colton *News*, Nov. 21: The mining industries of this county took a boom immediately upon the passage of the silver bill which directed a less limited coinage of silver, and if the Republicans will, during the expected extra session of Congress, pass another bill which will provide for the free coinage of the white metal, this important industry will at once leap to the front rank where it belongs.

Shasta.

BALAKLAVA MINE.—*Democrat* Nov. 19: This property, one of a group known as the Windy Camp mines, owned by B. Conroy, Willard & Weil, A. C. Ellis, Billy Murray and others, was bonded Monday to a Milwaukee syndicate of capitalists who, we understand, made a handsome first payment, which shows that the purchasers mean business. We are also informed that the new company are large smelters, and will immediately commence extensive development work on tbe mine, which is already quite well developed with prospecting shafts, tuonels, drifts and crosscuts. The agents who made the purchase are experienced mining men and smelters, and examining this helt of refractory ore, said they were greatly surprised at the extent of the ore deposits. We predict that this sale is the forerunner of a great mining boom in this county, for if this company succeeds in their undertaking, it will cause the development of that whole belt of gossan ore between Squaw creek and Iron mountain, which we verily believe is the making of a second Comstock.

EXAMINING THE MINES.—Quite a number of mining men from abroad have been running and out to the mines in this county for the past two weeks, making Redding their headquarters. Three of these parties seem to be making a thorough examination of mining properties for sale in the county, and we will not be surprised to hear of one or more big sales soon. Just now mining property is engaging the attention of capitalists from every direction.

VARIOUS OTHER MINES.—The Trinity Mining Co. have their ten-stamp mill well under way. The cluster of mines north of the Trinity will most likely be sold in a short time to San Francisco parties. The Trinity Co. is the first to erect a stamp-mill on Dog creek. A young miner by the name of Bucher is taking out some very rich rock on a blind lead he discovered this year west of Sbasta. The vein is a strong one, well defined, and yields ore that will mill from $150 to $200 in free gold. It is considered one of the most promising prospects in the county. The new machinery at the Eureka Tellurium Co.'s mine on Middle creek will be in running order in a few days. The company will do some extensive work in this mine this winter. The Central Mining Co. of Old Diggings will let a contract this week, so we are informed, for running a 600-foot tunnel on the Central. A lot of new machinery for the Calumet mine arrived here Saturday night and is being hauled to the mine.

MINES ABOUT DELTA.—*Free Press*, Nov. 22: Mr. Champion, owner of the Carter & Coyle mine at Delta, reports a tunnel 300 feet long tapping a four-foot ledge, rich in free gold and sulphurets, 120 feet below the earth's crust. The ore averages about $65 to the ton. He also owns five other properties which are partially developed. The ground is leveled for his new ten-stamp mill and all the machinery is on the ground. He expects to he running by December 1st, water being the power employed. He has on band 500 tons of ore taken from the tunnel while driving ahead. Forty men are employed and a tramway 2000 feet from the mine to the mill will be soon completed. Mr. Champion has also erected a $2000 residence which alone shows his confidence in the Delta mining property. The Ballaklala mine has been bonded by Eastern capitalists who will proceed to develop the property. There is no reason why this mine should not pay as well as the Lost Confidence at Iron Mountain. The Gold Chest Mining Company of Trinity county are running a deep tunnel to tap their ore chute 150 feet deeper than the present level. Mr. Whittier of San Francisco, a wealthy owner in this mine, thinks more of it than any contract he ever had. We are informed that the Thomson mine, in the Lower Springs district, will resume operations about December 1st. A three-foot ledge, laid bare a month ago, gives promise nf plenty of ore rich in sulphurets. The miners of Lower Springs district propose holding a meeting in Shasta to-night to protest against the encroachment of agricultural settlers. Pete Scberer is actively engaged in getting matters in shape for extensive work on the tellurium mine this winter.

Sierra.

MINING ITEMS.—*Mountain Messenger*, Nov. 22: J. B. Moulton, Chas. Binning, Mr. Matheson, O. Scheffer and Robt. Evans are working at the Hardscrabble drift mine, formerly known as the hospital ground of the Bald mountain. Very hard rock in Young America tuonel, only a foot a day made, obliging contractors to throw up the job. The South Fork Co. is running its main tunnel with two shifts, and expects to reach bedrock 400 or 500 feet ahead. Cornelius Redding is still running a tunnel about a quarter of a mile below Forest City, where he has been at work for the past three years. Work has been in progress for the past three months at the Arizona claim. A shaft will be raised for gravel in the spring.

Siskiyou.

MORE QUARTZ-MILLS.—*Telegram*, Nov. 22: Ed Sheffield, at the head of White gulch, about five miles from Sawyers Bar, is grading and otherwise preparing ground for the erection of a larger quartz-mill than the one he bas heretofore used. It will be located lower down than the present one, so as to afford more water and greater pressure, and will be run all the year round. Frank H. Hall of Etna passed through Yreka yesterday on the road for San Francisco, where he will remain for two weeks, during which time be will purchase two large hydraulics, besides a large amount of other machinery for the new mines which are now being opened up in the Salmon river country. He reports the mining outlook in that locality as being more rosy-hued than for years. R. L. Fogundez, from the Salmon river country, was in Yreka the forepart of this week. He says that the Gold Ball Company are putting four more stamps in their mill, and that his own mine is giving employment to six men, and still producing good results.

ROBBING THE SLUICE-BOXES.—We hear of frequent complaints from the Klamath river of the cleaning-up of the miners' sluice-hoxes by Chinamen. We are informed that at Beehee's mine, a couple of weeks ago, it was estimated that about $800 was stolen in this manner. A couple of these night owls were arrested and brought to Yreka last week.

Trinity.

CANYON CREEK.—*Journal* Nov. 22: Last week we spent a few days on Cañon creek and found matters progressing in that camp. Shattuck and Grigsby bad their mill ready to run and expected to crush ore this week. The force at the Bailey mines was building a good, substantial cabin and making other preparations for the winter. The Globe Company have shut down for the winter; they have a splendid prospect. The Fisher Gulch Company bad their mill and water-wheel set up and geared. This week the company will lay 213 feet of pipe and put in sluice-hoxes and will then be in position to take advantage of the first water that comes. All the outside work now remaining to be done on the property consists in digging a short road from the mine to the mill and putting up an ore-bin. The ground is favorable and it will not take long to dig the road. The coming winter will show more concerning the Cañon Creek mines than has yet been ascertained. With two mills in operation the ore can be subjected to the only correct test—a mill test. It is the opinion of all acquainted with the country that Cañon creek has a bright future and in a short time will rank with tbe best camps of Northern California.

Tuolumne.

BUT LITTLE DOING.—*Independent*, Nov. 22: At present there is very little doing in mining circles, despite fine weather and plenty of water. The Golden Gate is the only mine that is doing much, while the Sanguiseppi holds its own. The Stanislaus gravel mine seems to he dragging along, with a great deal more gravel than gold. The Dead Horse and Black Oak are both doing nothing to speak of, and the Buchanan not much. The pocket miners are doing very little. The Old Colby claim, and the Oliver and Oaks claim on Saw Mill Flat, are operating vigorously, but there is no gold in sight. The Bonanza paying vein petered, and for over a year nothing has been realized by its operators, but during which time over $30,000 has been expended.

Yuba.

DRIFT STRIKE.—*Appeal*, Nov. 20: A rich strike has been made in the Ayer drift mine at Smartsville. It is owned by the Excelsior company and is under the management of W. J. Stewart. This development is said to be one of the best ever made at Smartsville, and gives promise of renewed prosperity for that place. The lead of rich matcrial opened is 30 feet wide and 50 feet high, and is believed to be an old river channel. The indications are that it can he followed up for a long distance. It is paying remarkably well. The cement is worked by arastras. There is another claim adjoining this, owned by Mr. Wheatoo, which will probably pay as well. The expectation is that a large number of men will soon find employment at Smartsville, drift mining.

NEVADA.

Washoe District.

BEST & BELCHER.—*Territorial Enterprise*, Nov. 22: On the 800 level west crosscut No. 2 has been cleaned out and repaired 30 feet; total distance, 300 feet. Formation, porphyry and clay. On the 1200 level upraise No. 1 has been carried up 12 feet; total bight 41 feet. Formation, hard porphyry.

GOULD & CURRY.—On the 200 level the northwest drift has been extended 10 feet; total length, 95 feet. Formation, quartz showing some value. On the 250 level, opposite east crosscut No. 1, a west crosscut was started and advanced 25 feet. Formation, quartz and porphyry. On the 400 and 450 levels from the old stopes have extracted 40 tons of ore of fair quality. On the 625 level all work is confined to repairs.

CROWN POINT. — Work prosecuted in various drifts and crosscuts as usual. Shipped to the Mexican mill during the week 386 tons of ore, the average battery assay of which was $13.56 per ton.

OCCIDENTAL CON.—The stopes on the 350, 400 and 450 levels are yielding 40 tons per day of fair-grade ore. The west crosscut on the north line, 650 level, is in 43 feet showing low-grade ore. The mill is working about 300 tons of ore per week of the average assay value of $20 per ton.

HALE & NORCROSS.—Crosscuts on the 800, 900 and 1100 levels all being advanced with some low-grade ore being developed. Have rctimbered 25 feet of the incline below the 1300 level, and have men on repairs in the main vertical shaft.

WARD COMBINATION SHAFT.—East drift from the 1800 station is out 685 feet. Face in porphyry.

SAVAGE.—During the week have hoisted 923 cars of ore from the 300, 400, 500, 600, 750 and 1300 levels. Shipped to the Mexican mill 492 tons of ore and to the Rock Point mill 363 tons. Milled during the week 750 tons, the average battery assay of which was $20.15 a ton. Have hullion on hand and at the mills amounting to $23,854.88. Prospecting pushed throughout the mine.

CHOLLAR.—The upraise 100 feet south of the north line on the 750 level is up 65 feet. Extracted and sent to the mill the past week 547 tons of ore. Average battery assay, $19.75.

BELCHER.—Shipped to the Vivian mill during the week 269 tons of ore tbe average battery assay of which was $23.24.

JUSTICE.—Shipped to the mill during the week 204 tons of ore, tbe average battery assay of which was $21.23.

YELLOW JACKET. — Shipped on an average 75 tons of ore daily to the Brunswick mill; tbe battery assays average about $18 a ton. The usual prospecting work is going on on the different levels.

ANDES.—The north drift on the 420 level was extended 15 feet. Formation, quartz and clay giving very low assays. The south drift from No. 1 west crosscut was advanced 12 feet. Formatinn, quartz and porphyry.

OPHIR,—On the 1300 level, the west drift is extended 35 feet in low-grade quartz.

SIERRA NEVADA. — On the 630 level the new southwest drift is out 53 feet in a soft porpbyry formation, which shows some water.

MEXICAN. — East crosscut No. 1 on the 1465 level has been advanced 28 feet in a soft porphyry formation.

UNION CON.—On the 1465 level, east crosscut No. 2 from the north lateral drift is out 257 feet. It continues in a soft and favorable porphyry formation.

UTAH.—On the 725 level the main soutb drift is out 793 feet and continues in soft porphyry containing some clay streaks. It is a promising formation.

CON. CAL. & VA.—Ore continues to be extracted from the 1200, 1300, 1500, 1600, 1650 and 1750 levels. Most of the ore is coming from the 1600 and 1650 levels. Some good prospects are obtained in the southwest drift on the 1750 level. The usual auount of ore has been shipped to the Eureka mill, the average assay of which will be about the same as last week. Exploratory work being pushed on other leading mines along the lode without any important ore developments being made, or other notable changes in the situation.

Trinity District.

PETERED OUT. — *Territorial Enterprise*, Nov. 20: A United States Marshal recently levied upon the mining properties of tbe Manhattan Co. at Austin for $150,000. The old Manbattan mill, which has ground out $1,000,000 on the average for about 25 years, has been dismantled, and what little ore is extracted from the mines of that once busy district bas to be shipped to Salt Lake or elsewhere for reduction. This mine was sold by the late John A. Paxton and others several years ago to Eastern parties for a hig sum. It was thought at the time by many tn he pretty well worked out.

STILL PLENTY OF WATER. — The volume of water in the Carson river is more than sufficient to turn the wheels of all the quartz-mills. The water, however, is in no place overflowing the banks of the stream.

ALASKA

GOLD PRODUCT.—*Alaskan*, Nov. 15: Lyman E. Knapp, the Governor of Alaska, in his annual report shows that among the exports during the last year was gold (estimated), $2,000,000; all other exports sufficient to make the total $9,840,730. He states further that considerable activity has been manifested, but no excitement in connection with the various mining interests. As the weather remains favorable, operations continue active in the quartz-mining districts, from all of which good accounts are being received. It now seems probable that a good deal of work will he done during the winter. It is believed that another year will see more than one hig gold mine opened up on the Treadwell helt, some of the other claims along that quartz zone being considered fully equal if not superior to that noted property.

ARIZONA.

DOING GOOD WORK. — Prescott *Journal*, Nov. 19: The Crowned King mill is running and doing good work, making three tons of high-grade concentrates per day. C. B. Bishop of the Four-Mile House is developing an onyx quarry or mine near Antelope station on the Black Canyon road. A new 10-stamp mill will shortly be built on the Hassayampa. J. J. Williams, superintendent of the Hackberry M. Co., is making a survey for a 20-inch gauge railroad to connect the Hackberry and Boggs mines on Big Bug. The length of the road will he about three miles. The company has also located a site for a smelter, which they will put up in the near future on Big Bug creek. The Catoctin group of mines in the Hassayampa district was sold yesterday.

HARQUA HALA MINES. — Phœnix *Republican*, Nov. 19: Col. C. H. Grey yesterday sold out his interest in the Harqua Hala group of mines to Hubhard & Bowers for $50,000 cash. There are some nine or ten claims in the group and they are all rich in gold-hearing quartz. The result of yesterday's sale will he the immediate renewal of work on the mines and the expenditure of over $100,000 in various improvements looking to their thorough development. The Phœnix *Herald* of the 12th says: A. G. Hubhard will erect a 20 or 30-stamp mill at Harqua Hala, piping water six miles from Harrisburg.

CARGO MUCHACHO. — Yuma *Times*, Nov. 19: The Blossom mine, about two miles from Cargo Mucbacho, will receive a 10-stamp mill on tbe next

steamer from the Needles. Water will be furnished to this mine by the Paymaster M. Co. by a pipe-line from the Cargo Muchacho reservoir.

BRITISH COLUMBIA.

FROM REVELSTOKE.—*Inland Sentinel*, Nov. 20: Fred Wells, who came here last week from Golden with about 40 tons of ore, carried home with him a round lump of money—nearly $4000. He expressed satisfaction at the quickness with which his ore was sampled and the value ascertained, the correctness of the assays, and the promptness with which he was paid the amount due him. J. M. Kellie, M. P. P., returned from Southern Kootenay this week after visiting all the camps except Goat River. He has formed a very favorable opinion of its mines and miners, and will go to the Legislature knowing all their wants and prepared to represent them in his official actions.

MICA DEPOSITS.—On Thursday, the 6th inst., Louis Victor and a party of Indians returned from a seven weeks prospecting trip up the North Thompson river. They had 25 horses with them, and although they had difficult work, made the up journey of 300 miles in less than two weeks. The country around the headwaters of the river and the Tete Juane Cache was covered with a foot of snow. Notwithstanding this impediment to the work of prospecting, they located the mica mines in which they were in search of, camping at the mines three weeks, staking out claims. The ledge they located shows 40 feet wide and 50 feet high on the side of the mountain, and indications are that they have struck a mountain of mica. Some fine samples were secured and brought to town, the largest of which was about 10x18 inches surface and almost as clear as crystal. Some cubes of almost two feet were exposed in places, a slice from one of which was broken in two in being brought to town. The mica splits readily to any thickness desired and is undoubtedly of as good quality as can be obtained anywhere, and its locators have evidently struck it rich. There was four feet of snow on the level when the party left the camp for home, and they experienced terrible hardships on the return trip, their horses suffering most, six of the animals dying from want of proper nourishment. They found lots of grass, but it seemed to have no substance in it.

COLORADO.

TOURTELOTTE PARK.—Aspen *Times*, Nov. 16: Every property of any note in Tourtelotte Park is now being worked except the Silver Bell, and most of them are showing up well. The O. K. is making a particularly good record. Manager Ellis is shipping 30 tons of ore per day that is of very good grade. The Justice has developed a very large body of low-grade ore about 300 feet southwest of the shaft. This is an entirely new chute. The fissure that runs southward was followed for some distance, and a drift from this work developed the new ore body. Everybody connected with the Good Thunder is highly pleased. The Little Rule is busy erecting an ore-house to accommodate the output. The mine continues to improve steadily, and its future is now assured.

THE GOOD THUNDER.—Both leases on the Good Thunder are showing up wonderfully well, and the property is evidently a bonanza. The mine is outputting from 50 to 75 tons per day, and the figure will soon be run up to double that amount.

STRIKE.—An important strike was made yesterday in the Jenny Lind mine near the head of Keno gulch.

THE mine-owners about Aspen are again suffering for want of ore-transportation facilities.

IDAHO SPRINGS.—*News*, Nov. 21: A strike of more than ordinary importance was made this week in the shaft of the Plutus. The Allen concentrator shipped 20 tons of high-grade ore from the Lexington yesterday. Energetic development continues on the Salisbury. W. S. Comer is jubilant over a strike which has been made at a depth of 30 feet in the Alpine shaft.

IDAHO.

A WISE SUGGESTION.—Ketchum *Keystone*, Nov. 11: The Legislature, soon to convene, would do well to make provision for the establishment and maintenance at Boise City of a State Mining and Geological Bureau. The East Fork of Wood river is steadily progressing. The *Keystone* predicts that it will be the liveliest camp in that section next spring.

ANOTHER REVIVAL.—Wood River *Times*, Nov. 19: In the early '80s Muldoon was a camp of considerable importance. It had a smelter, and three or four companies operated there. The returns being unsatisfactory, the companies suspended operations and the camp went down. The 300 or 400 inhabitants dwindled down to about a dozen. These last were stayers, however. Their perseverance seems about to meet with its just reward. The Telegraph claim, owned by Steve Winchester, is showing three feet of solid galena ore, a trial shipment of four tons of which, just made to Hailey, netted the owner an average of $108 per ton. Mr. Winchester has been working this claim nine years, and has shipped enough ore to pay expenses. Now, however, he has a good body of it. Two other mines in this group have also opened up bodies of pay ore.

THE DELAMAR MINES.—*Avalanche*, Nov. 22: Capt. DeLamar has recently purchased Frank Lepley's interest in the Zulu mine, connected with the Sommercamp group, paying $10,000 therefor. This was purchased to make his holdings of mining property one compact body, which is now complete, one mile long by three-fourths of a mile in width, or 480 acres. They have opened up a new lead of gold-bearing quartz on the DeLamar property. The lode is several feet wide and assays at a depth of 25 feet, $29 in gold and $4 in silver.

THE POORMAN MINES.—McElmeel and Mickelson have run a 200-foot tunnel on the south extension of the Illinois Central lode. They have a good showing of $80 ore. The Illinois Central is one of the group recently sold with the Poorman, and the above development is an evidence that the lode is continuously good. The same paper says that two very rich strikes have been made on Florida mountain. The Trade Dollar mine has run 30 feet into a body of ore that assays $6000 per ton. This rich ore is six inches wide; three feet more of the ledge will average $300 per ton. The ore strike is in the Phillips and Sullivan mines. They are now working in a chamber of ore fully 12 feet in width, which is proving enormously rich. A streak of talc clay in the lode, in places two feet in width, is literally bound together with wire gold, and massive specimens exhibited from this streak surpass anything in richness heretofore shown from Florida mountain.

LOWER CALIFORNIA.

ALAMO. — *Lower Californian*, Nov. 20: Two large bars of gold, amounting to over $6000, were sent down by the different companies of Alamo on the last stage. The Montezuma mill has closed down because of water in the mine. J. Albright is now above buying pipe, pump, etc. The El Paso mill is running on custom rock, also Lane's mill and the Manzanita. Thus it will be seen that Alamo is alive so far as milling goes. Contracting is quite lively and considerable ore is being taken out. The Aurora Co.'s hoisting works are expected soon and when they arrive the mine will become probably the best producer in the camp. The new 10-stamp mill will be set up in the gulch near the mine.

COAL.—The discovery of anthracite coal in Sonora is causing more interest to be felt in the coal measures of Arizona and Lower California. The diamond drill penetrated a vein of fair coal at the depth of seven feet below the surface. At 80 feet a vein of fine anthracite coal was struck.

MONTANA.

AROUND DEER LODGE.—*New North West*, Nov. 21: Nothing is being done in Bear Gulch now, the placers having closed down. About five miles east of Beartown some good silver quartz mines are being developed. The Phœnix Mining Co.'s Board will meet to-day to take the necessary steps to make their stock assessable.

ABOUT BUTTE.—Butte *Miner*, Nov. 19: Two-hundred-ounce ore has been struck on the 100-foot level of the Valley claim, which lies between the Vulcan and Star West, south of the city.

BUTTE AND BOSTON.—The new 400-ton concentrator at the Butte and Boston Co.'s works was started up yesterday for the purpose of testing the machinery. Everything about the new plant worked to perfection, and within 12 days the works will be in full blast with an all-winter run before them. The two new O'Hara furnaces are also finished, and work on the four Bruckner furnaces is being rushed to completion as fast as possible. The management is highly pleased with the working of the machinery so far complete, and considers that the company is now on the road to success commensurate with the enterprise exhibited. The Butte and Boston Co. started in on a small scale only two years ago, since which time it has more than trebled the capacity of its plant and extracted the money from its Butte properties with which to do it.

MADISON COUNTY.—Bozeman *Chronicle*, Nov. 19: The Little Kid, bought by Mr. McKelvey, is showing up a four-foot vein of high-grade ore, and is pronounced by experienced miners the best showing for a bonanza in the county. Work on the Red Chief mine at Red Bluff is being prosecuted with a force of 15 men, night and day. A rich strike was made on the Noble mine below Sheridan, last week. We have not learned the extent of the strike, but hear that it is extraordinary even for this great property, which has long been noted for the production of rich ores.

SALE.—Montana *Mining Review*, Nov. 19: The property of the Lone Pine Mining Co. has recently been sold to an English syndicate for $500,000 cash.

LARGE YIELD EXPECTED.—Butte mining men state that all indications point to the greatest total output of mineral for that camp during the coming winter that has ever been recorded to the credit of the camp for one season since its organization.

JEFFERSON COUNTY.—Last week a fine strike was made on the Pilgrim's Progress in the Woodland Park district. The vein is two feet wide, and in this there has developed a seven-inch streak of crystallized lead ore running 800 to 1200 ounces in silver.

NEW MEXICO.

GOOD MINES.—Silver City *Enterprise*, Nov. 21: N. Bell brought down from Pinos Altos last week 30 pounds of gold, and this week will ship about the same amount. The ore is from Bell & Stephens' Pacific mine. Two cars of copper bars were shipped from the Anson S. last week, and two more will be shipped next. At the present price of copper, a well-loaded car is worth from $7000 to $8000. From this it will be seen that the Anson S. is no small producer, considering that the development of the mine is as yet quite limited.

SILVER CREEK.—*Southwest Sentinel*, Nov. 18: J. A. Sperry of New York, a miner of 30 years' experience, has just visited the Silver Creek mining district in the interest of Eastern capitalists. He says that district presents the most wonderful showing of ore he has ever beheld. The croppings on either the Last Chance, Elberle or Consolidated mines, Mr. Sperry says, are greater than the croppings of the entire Comstock lode.

add min share market

CAMP CARLISLE.—*Western Liberal*, Nov. 14: A new strike has recently been made on the Jim Crow ledge about three miles from Carlisle and about 200 yards from the Duncan & Carlisle stage-road. It is called the Alabama mine. They are 15 feet down and have a vein of ore two feet wide. Twelve assays on vein matter went $271 the lowest and $584 the highest per ton, mostly silver.

UTAH.

BINGHAM.—*Tribune*, Nov. 18: The Stewart No. 2, Bingham, is a gold property which was worked for a time some years ago, and has remained idle ever since. Mr. P. A. Snell started to developing the property last June, and has made good progress. A body of pay ore has been developed of large extent and worth from $10 to $100 per ton.

UTAH'S MINING STOCK EXCHANGE.—Secretary Pollock of the Mining Exchange is busy with correspondence in the interest of the Exchange. He is in receipt of a letter from a Butte man who says he has been spending considerable time in St. Louis, Denver, Salt Lake City, San Francisco, Spokane Falls, Butte and Helena, and he looks upon this city as being the natural business center for handling mining stocks for all the West.

HORN SILVER IN THE TINTIC MINES.—From parties just in from Tintic it is learned there is great excitement in that camp over the find during the past week of horn silver in the Centennial-Eureka, also in the Black Dragon. This is very gratifying news, and confirms the belief that the whole country in that belt is very rich in metal. The mines in Tintic are all the time showing up better and richer as they go down and crosscuts are made. This is particularly the case with the Bullion-Beck, Eureka, Centennial-Eureka, Mammoth, Northern Spy, Eagle, Governor, Carissa and others, which have in the past months of the year been turning out so much ore. The aggregate output of these mines will be a surprise for this year when the figures are made up. There are a dozen more properties which will become big producers within the next few months if the present indications develop truly. It is said an immense body of horn silver was struck in the Keystone in the last few days. Two carloads of it are now on the dump and the lowest assays give 297 ounces.

DIVIDENDS.—The Daly has declared dividend No. 45, payable in this city, San Francisco and New York, of 25 cents per share, aggregating $37,500, payable Nov. 29th. The Centennial-Eureka paid its dividend of $2.50 per share, or $75,000, yesterday, Nov. 16th.

BUSY MINERS.—At least 1500 miners are now employed in the mines in the Tintic district.

A NEW DISTRICT.—Eureka *Chief*, Nov. 14: There have been rumors for some time that a rich ore discovery had been made in the mountains south of this district, but no accurate information could be secured until last Saturday, when the *Chief* obtained an interview with Col. A. W. Smith, a Colorado expert, who has spent the past six years in Chili, Peru and Old Mexico in the interest of wealthy companies. His attention was drawn this summer to this district, and he prospected it thoroughly, arriving at the conclusion that the Mammoth vein continued south and must come to the surface somewhere in those mountains. Here the search for the vein really commenced and a big porphyry was discovered, and mineral estimated to be worth $15,000 lay in view. A mill test on the ore gave $133 silver, $62 in gold, 28 per cent lead and a unit in copper. Two claims, the John P. Jones and Henry M. Teller, were located, and two wells were sunk and water obtained. Colonel Smith feels confident that the discovery is the continuation of the Mammoth vein and that a very rich mine will be developed. He left Saturday for the find to commence development.

SOUTH DAKOTA.

ELK CREEK DISCOVERIES.—Deadwood *Pioneer*, Nov. 15: Several new discoveries are reported from the vicinity of Elk creek. The ore is principally a carbonate, and goes away up in gold and silver. The formation is lime rock, and the veins go down nearly perpendicularly. There seems to be no reason why this section should not become one of the greatest mineral-producing localities in the Hills. It lies just east of Galena, in a direct line with the course of the veins of that place, and throughout the limestone have been found some extremely high grade silver rock float.

IRON CREEK.—Work on the Iron creek placers has been closed down for the season. Never before in the history of the camp has the work proved so unprofitable as during the last year.

WASHINGTON.

GOOD PROSPECTS.—Okanogan *Outlook*, Nov. 19: C. H. Ballard and Wm. O'Neill returned Monday from a trip to the Similikameen and Palmer mountain districts. Mr. Ballard has been examining several mining properties for different parties, and brought in a lot of ore specimens for assay. He says that part of the county which he has just visited is showing up splendid, as a result of the development of the last season. Several prospects have been opened up which will compare favorably with any located in either Conconully or Ruby districts. "The Ivanhoe," he says, "is indeed a wonderful prospect, and I might almost say the best I ever saw. There are tons and tons of ore in sight that will mill from $300 to $500 per ton, with here and there deposits that will run up into the thousands. But the most wonderful part of it is the manner in which the ore is being extracted. The loose soil is removed with a plow and scraper, leaving the ledge bare and ready for breaking and sacking. It is estimated that there is $150,000 worth of mineral in sight. A shipment of 10 tons was recently made of ore that will run from $300 to $500 per ton. Messrs. Cowherd and Westren are comfortably located with their families at the mine and are doing some good work. There are hundreds of good prospects in Okanogan county, but really I believe this is the bonanza."

VARIOUS MINES.—Several tons of ore from the First Thought mine were shipped to Tacoma last week for treatment. This is the first shipment of a large quantity ever made from this mine, and all are anxious to know how it will run. Mr. O. F. Zienkeison, of Spokane, has secured a bond on the Opbir claim, a fraction located on the north extension of the Lady of the Lake lead. He has a force of men employed in running a prospecting tunnel. The Mohawk mine on Mineral hill is producing some fine-looking ore. Mr. Lawrence, the owner, brought down a specimen this week, that weighed about 100 pounds. The character of the ore is a high grade galena, carrying a large per cent of gray copper. The tunnel is in about 130 feet on the lead, which is over four feet wide. The mines in the Silver Creek and Monte Cristo districts are assuming great proportions and attracting much attention, and at a day not far distant there will be a railroad running right to the mines, and the vast mineral wealth of those mountain deposits will be hauled to large smelters which will be built at Sultan and employ a great many men.

WYOMING.

IRON AND COAL.—*Republican*, Nov. 19: Almost in the geographical center of Wyoming is a mountain of solid hematite iron ore more than a mile wide and two miles in length. Besides the iron, the mountain contains lignite coal enough to warm the entire world for a century. A dozen dried-up lakes of soda, where the soda is deposited to a depth of over 300 feet, occur near by. In his report to the Secretary of the Interior, the Governor of the Territory says mining presents the greatest possibilities of any of the various resources of the commonwealth. The area underlaid with coal exceeds 30,000 square miles and coal mines are being rapidly developed and the output greatly increased. No strikes or disturbances of any magnitude arising out of disagreements of employers and employes have occurred for years. The State geologist is now in the field examining new mineral discoveries and will soon have ready his report upon the mineral resources of the State.

Mining Share Market.

For the first three days of the week under review, the Comstock shares showed considerable strength, with a slight advance established in the leaders. On Monday the market opened strong at an advance, which resulted in a further advance after regular Call under active trading. Prices kept up in the afternoon Call but weakened after Board. Yesterday morning the market opened inactive at lower prices, with apparently outsiders selling. After the Board, trading continued quiet at unchanged prices. In the afternoon there was but little business, with the market weak. After Call, Overman developed considerable strengh and under freer trading the stock scored an advance of about 20 per cent on Call prices. The other stocks advanced slightly in sympathy. In outside stocks the market was dull, with only the Bodies scoring an advance. The upward movement in the Comstock we indicated in our last week's issue. While the writer believes that still higher prices will obtain, yet caution is advised, and that a small profit is much better to take than to try and get the "earth and a fence around it," for those who follow the latter course generally come out without even a picket. The above opinion is based upon the belief that the moves in the market do not indicate that such men as Senator Fair, Gen. Hayward and Col. Mackay are at the helm, but on the contrary they indicate that a few outsiders have pooled their interest and grown rich by little stealing deals. As long as the latter run the markets a small profit is better than the talked-of large profits which seldom materialize. The former persons never have, so far as we can learn, been largely identified with stocks unless based on merit in the mines.

It is very generally believed that while the mill ring gets away with the bullion from the mines, a stock-gambling pool here gets away with operators' money through petty deals on big bull points.

The share market opened this (Wednesday) morning dull and barely steady. After Call, prices shaded off under light trading. The points are out for a little higher figures, then lower prices. Many are waiting for the lower prices to come and then buy.

The news from the Comstock mines continues of a very encouraging character, with the most important results looked for in the west workings. Strikes to the west heretofore reported in one or more of the mines are either being or will be developed in all directions—provided before it be done thoroughly the new find of ore is not claimed by companies located to the west. This is more than likely to be the case and dealers in the shares of the *now* leading mines must keep their "weather eye" well open to see which mines will get the ore after it is developed. Official letters from some of the Gold Hill and Middle mines were not in the offices up to this (noon) writing, but it is hardly likely they contain more than the usual skeleton report. The move in Overman is doubtless based on better concentrated stocks which admits of more important prospect work. The superintendent of Caledonia reports that work in that mine will be resumed on the 1100-foot level where there is a streak of ore assaying a few dollars a ton. An accident in the Andes shaft last week would have been the death of several miners had they not got out through a manway into West Con. Virginia shaft. Work in sinking the latter company's shaft is being vigorously pushed.

In answer to an inquiry we state that the action against the directors of the Hale & Norcross Mining Company is not dead, but on the contrary it is said much valuable testimony is being secured by the plaintiff. The latest deposition taken is that of U. S. Senator Jones.

A Big Thing.

Col. E. N. Robinson, general manager of the San Jacinto Estate, limited, has recently returned from England, armed with the sinews of war. His plan for the development of this valuable estate has met with the entire approval of the chairman and directors of the property, which can but add so largely to the prosperity of not only our county, but the whole Pacific Slope, as well as to the United States of America. We confidently predict that the Temescal tin district, which is situated in the central portion of this immense estate, will, in the near future, be to the United States of America what Cornwall has been to England during the past 400 years. It comprises 45,126 acres, or 70 square miles of territory, and not only contains cassiterite, the oxide of tin, of an unusual high per cent, which is the most valuable ore of tin known, but veins of gold in place that compare favorably with our most prosperous gold-produers on the coast, not even Grass Valley or Amador excepted. The ores of nickel, copper and silver of high grade are also found in the northwestern portion of the estate, as yet only partially developed, but of great apparent value.

In the southeastern portion of the estate, the celebrated series known as the Gabilan occurs in a porphryitic granite formation, bearing a strong resemblance to the auriferons veins that occur in Grass Valley and Nevada, which have been so highly productive. These veins are strong and well defined and have been worked for their values to a depth of 400 feet on the inclination of the lode, until water prevented further development. The ore of this mine paid from $30 to $50 per ton, and was hauled nine miles to a mill for reduction, and made the owner rich. The works were discontinued on account of water litigation and no lease.

The manager, Colonel Robinson, has decided to rehabilitate these mines in a business way, and has wisely employed J. H. Crossman, formerly of Grass Valley, as consulting engineer and to superintend the work of development. Mr. Crossman has inaugurated the work under instructions from Manager Robinson, and ordered suitable buildings and material, and will take charge in person of the work of development until the mines are a bonanza and dividend-payers. He is confident of success, and knows whereof he speaks.

MECHANICAL PROGRESS

The Activities of Our Iron Industries.

The activities of our iron and steel industries, the enormous output and the steady demand, says the *Age of Steel*, constitute part of the industrial phenomena of the present decade. The market has absorbed the product without strain, and the state of the ironmaster has had as yet no innocent blanks on its surface. This activity has been world-wide, and the industrial situation generally exuberant. Edward Atkinson has been studying the cause of this phenomenon and looking into the prospects of its continuance. The demand has not been the result of temporary conditions. Iron and steel are here to stay, and in diversified and in varying forms to become more and more part of our industrial life and structural enterprises.

The present production of pig iron the world over is 28,000,000 tons, of which the United States will make in 1890 not less than 10,000,000 tons, and in the next ten years, or in 1900, about 44,000,000 tons; the demand for iron at that time being on a reasonable computation not less than 56,000,000 tons. These figures are based on the normal growth of the last 50 years, and are independent of the demand that must logically increase in the opening up of Asia and Africa.

With these considerations in force, the statistician asserts that the producing capacity of all iron-producing countries will be fully taxed for the next ten years, and that where the raw material can be assembled at reasonable rates, and furnaces be operated to advantage, there is, barring unforeseen contingencies, an absolutely certain prospect for continued activities.

He places prices as possibly oscillating in a small way, but with an upward tendency; and the trend of the American iron industry as yet to be centered in the Appalachian region of the South. Accepting all possible interruptions or qualifications of this iron and steel forecast, the significance of the situation is that of continued activity in these industries.

Fast Coming to the Front.

Another iron trade journal has the following: That this country is rapidly forging to the front as an industrial nation is evidenced by facts that are being brought out by the reports of the Census Bureau for the last decade. The consumption of iron and steel is an indication, admitted as evidence of a country's industrial thrift, and the returns of the Bureau just issued show that the United States leads all other countries in certain lines of iron and steel production, while it is rapidly gaining in others. The total production of steel in 1889 was 4,466,926 tons, an increase since 1880 of 290 per cent. In the ten years from 1880 to 1890, the production of Bessemer steel ingots and direct castings has increased from 985 208 to 3,778 572 tons; open-hearth steel from 84,302 to 504,351 tons; of crucible steel from 76,201 to 85,536 tons. No Clapp Griffiths or Roberts-Bessemer steel was made in the census year 1880, as there were no works in existence in this country at that time. During the year ended June 30, 1890, the production of Clapp-Griffiths steel in the United States was 83,963 tons, and the production of Roberts-Bessemer was 4450 tons. The United States now leads all other countries in the manufacture of Bessemer steel rails, the output during the year ended June 30, 1890, amounting to 2,036,654 tons—an increase of 1,295,179 tons over the production of the year ended May 31, 1880. In the manufacture of basic steel this country has made a prosperous beginning, the production of this kind of steel during the year ended June 30, 1890, amounting to 62 173 tons.

MOTIVE-POWER FOR MECHANICAL USES.—Wonderful are the possibilities of the future in respect to motive-power for mechanical uses. At present the growing conviction seems to be that electricity will be the great agent for all industrial uses of power, and yet there are some who hold to the belief that the distribution of motive-power from a given station of development will be effected by means of compressed air. What appears to be a very successful attempt in this direction has been made in England at Birmingham, where, by means of a steam engine located at a central station, compressed air with a pressure of 45 pounds above the atmosphere is delivered in pipes laid in the street like gas pipes and carried to a distance of four miles. At convenient points the mains are tapped for air-power, which is supplied to industries to the number of 40, and it is said the loss by friction is practically unnoticeable and that the power is applied to engines varying in size from a half horse power up to 50-horse power with great satisfaction to the consumers. One evident advantage of this method is the convenience of having motive-power where wanted, without the necessity of erecting boilers and engines, although this of course is also true of electrically conveyed power and of steam taken from pipes and conveyed to a considerable distance, as is already successfully done. There is something very pleasant in the suggestion of driving one's machinery by simply opening a pipe of air compressed at a distant station, without the annoyances, expense and danger of manufacturing steam upon the premises in the ordinary way; but whether the compressed-air method is economical in comparison with other recent improved methods of transmitting power remains to be proved by longer continued experiments than those which have yet been made. In this wonderful age anything seems to be possible, and who knows but what compressed air may be one great means of mechanical propulsion in the near future?—*Railway Age.*

A NEW METAL FOR BULLETS.—The intensity of the competition between civilized nations in the application of the latest discoveries and inventions to their equipment for war is again illustrated by the current interest taken in German military circles in the new Wolfram rifle bullet. Lead has been used so long that few people outside of the military establishments in any country have ever considered the possibility of its displacement by a harder metal. Wolfram ore is a tungstate of iron and manganese, which in its metal form is nearly as hard as steel and very brittle. Fifty per cent heavier than the old leaden ball of the same size, the Wolfram projectile does the same work at a distance of 1200 metres that the present model 88 bullet does at 800 meters. It is said to penetrate a steel plate eight millimeters thick at a distance of 600 meters, while the leaden bullet penetrates an iron plate but seven millimeters thick at a distance of 300 meters. Among the advantages of the new projectile is that which allows a much lighter rifle and therefore a greater store of ammunition for each soldier. Considerable doubt is expressed that sufficient quantities of the new metal could be mined for the needs of the whole German army in time of war, but the mine-owners claim to be able to provide all that the Government could use. Should the Wolfram bullet prove wholly successful in the tests given, its adoption and use in war would add another interesting and quite unknown factor to the character of the next great European struggle.—*Springfield (Mass.) Republican.*

STRENGTH OF MANGANESE BRONZE.—A manganese bronze tube similar to those used in hydraulic gun carriages was recently subjected to a severe test by Messrs. Armstrong, Mitchell & Co., England. The tube was 4.9 inches outside diameter, 0.3 inch thick and 18 inches long. An internal pressure of 4000 pounds per square inch was applied without increase of outside diameter; 5000 pounds pressure produced an enlargement of 0.03 inch; 6000 pounds pressure increased the diameter 0.08 inch. The testing pump could not go beyond this pressure, so the tube was turned off to an outside diameter of 4.55 inches, leaving it 0.125 inch in thickness. A pressure per square inch of 1000 pounds produced no change of diameter; 2000 pounds pressure increased the diameter 0.1 inch; 2500 pounds pressure burst the tube. Two longitudinal specimens were taken from the tube and tested for tensile strength. They gave an ultimate strength of 31.5 tons per square inch and a stretch of 27½ per cent in 3 inches. Some of the advantages of tubes made from this metal are, freedom from the pitting and corrosion experienced with steel, and a strength when annealed double that of the best copper. For the same strength, manganese bronze tubes weigh about one-half that of copper or brass, and cost about one-third less per running foot.

NEW THING IN PIPE WELDING.—In welding together pipes by the electrical method it has been the usual practice to employ internal mandrels to prevent collapse or change of circumferential outline. Prof. Elihu Thomson, however, has recently invented a simple process by means of which the use of internal fixtures is avoided. The invention is based upon the fact that if a hollow structure be heated at a certain portion of its length and subjected to an upsetting action, it will bulge exteriorly instead of collapsing. The structure will therefore have a larger diameter at the swelled portion. In the present process, where it is applied to the welding of pipes, hammer blows are delivered at the weld or on the side of the pipe, and are so graduated as to simply contract this bulging or lateral spreading tendency. The hammering is delivered laterally so as to restore the metal back to its original position on the sides of the pipe. There is no tendency to collapse on account of the bulge of the pipe acting as a sustaining support.

AMERICAN IRON has made rapid inroads on the Scotch trade with Canada. When an American furnaceman contracts to deliver No. 1 foundry pig iron, he sees that it is all tested and of the same grade. The Scotch are careless in this respect, their shipments being unevenly graded. An English paper, the *Iron and Steel Trades Journal*, commenting upon the situation, says: "Advices from Canada show that the demand for Scotch iron has completely passed off, and unless something unforeseen arises, that market seems wholly lost to us; buyers cabling that their wants are being met by a cheaper and in some respects superior quality of American iron." The *Coal and Iron Trades Review* adds: "If it were not that Scotch pig is so useful for freightage purposes, it is doubtful whether the quantities sent to the United States would not dwindle to zero to-morrow."

ALUMINUM WIRE is being used for calking steam pipes in New York. A wire of one-quarter inch diameter is used, one turn of aluminum wire being first inserted, followed by four or five turns of a lead wire of slightly larger diameter, these last being calked in the usual manner. It is found that the aluminum does not cut, and is not acted upon by the steam as the lead is, so that the joints, it is claimed, remain tight.

SCIENTIFIC PROGRESS.

Man and Science.

It is only the supreme intellect of the human mind which renders what may be called the brute senses of man of use to him, because when untrained they rank far below the senses of the animal, though in the latter they are not so evenly balanced as in man.

The eagle and condor have wonderful vision. Of these birds it is said that the former can face with an unflinching eye the sun when shining with full noon-tide glory, and of the latter, Prescott in his "Conquest of Mexico," says: "The sight of the condor of the Andes is almost beyond belief. When a horse or mule drops by the roadside, scarcely a moment passes before one or more of these huge birds may be seen hovering over the unfortunate animal, proving plainly that they are guided by sight alone."

The sense of smell in animals is perhaps found in the highest perfection known in the well-bred bloodhound. This animal will follow a trail hours after the man or animal has passed, and never lose it, even though it had been passed over by hundreds.

The sense of touch possessed by the clumsy-looking elephant is most wonderful. The tough-looking hide which covers him would never make one think he could lay claim to the sense of touch in any degree of perfection.

Man supplements what he lacks by using his knowledge of the laws of nature. Thus, with the aid of the microscope and telescope, he can compete with the eagle and condor.

Up to the present time he has not invented any instrument which will aid in distinguishing odors, but passing over that, he has covered nearly the entire range embraced by the five senses—sight, taste, touch, smell and hearing.

When we speak of trained senses, we do not for an instant mean to imply that the man of the present age is better equipped by nature with the senses than his ancestors were, but that by the aid of scientific instruments he has supplemented the use of these senses to an almost supernatural extent. However, beyond a certain point he cannot go, as it is only in his power to use intelligently the things that be, not to create.

Every invention of man thus far has only consisted in some new or perhaps forgotten application of a law of nature, and is not in any way dependent on the inventor personally, save in his ability to make his knowledge of practical use to the majority of mankind.

The man of science is the idol of the present age. His daring and success in the field of invention have blinded the eyes of the people to the fact that there can be a limit to his power, and make them lose sight of the reality that he is only a pupil in the school of nature, where the doors are open to all.

It is not probable that any special benefit will be done mankind physically by this training, for it does not demand any abnormal conditions. It is simply a better understanding of our physical capability of using our senses by intelligently applying them to obtain a result known to be as certain as the law, "water seeks its own level."

There is a vast change in the tendency of the inventors of the present age, and this generation especially. Force is guided rather than controlled, and the result is that machinery has become more delicate and often more simple, but requiring by that very fact a more highly educated mind to operate it than did the crude machinery of the early inventors, where muscle was as much needed as knowledge. All that is changed. Ignorance is now often death-dealing, particularly when electricity is the motive-power or where chemical compounds are used.

Every day adds to the necessity for a practical working knowledge of the numerous inventions which are now found in daily use in all civilized countries the world over.

No one who has ever read "John Halifax, Gentleman," can forget the masterly description given of the personal antagonism felt by the workingmen to the machinery which was placed in his mill by the hero.

In their blindness they could not realize that mental labor placed them on a higher plane than manual labor, and that machinery at its best can only supply muscle, not mind, and that they were being given, by the very machinery which they were bent upon destroying, their one chance to be something more than mere machines themselves.

It is to be hoped as the world grows older it grows wiser, and that we are being carried to a "Golden Age" on the wheels of the inventions of the twentieth century.—*Dorsey Barton in the Scientific American.*

APPARATUS FOR MEASURING THE WEAR OF RAILS.—An ingenious apparatus for tracing the outline of rail sections so as to show the wear has been invented by Mr. W. Schilling of Stettin, Germany, "baumeister" of one of the government railways, and is already in use on several roads in that country and Russia. A full size section of the rail to which the apparatus is attached is very rapidly traced with great accuracy upon a sheet of paper, and the section thus produced can be readily compared to the standard section by placing a tracing of the latter over the former, when any wear will be at once apparent. A pointer attached to a little carriage movable both in a vertical and horizontal direction is attached to and worked round the rail, while a pencil traces a corresponding line on a sheet of paper. The slide can be moved freely in a horizontal direction on the rail. The paper is clipped on a little frame which can be swung backward to insert a new sheet. The inventor states that with a little practice the instrument can be set up and an outline drawn in less than two minutes.

PACIFIC COAST WEATHER.—The present season, thus far, has been one of unusual deficiency of rainfall for this coast. The cause of this deficiency is said to be due to an unusual falling off in the number of storms which have entered the North Pacific Coast from the Japan current, and also, and more especially to the fact that these storms have passed eastward at a higher altitude than in previous Octobers. In order to illustrate this very important fact, says Dr. G. G. Tyrrell, Secretary of the State Board of Health, I have prepared a set of storm-track charts for October, 1889, and 1890. A glance at these charts will show the relation between the extreme southerly position of the storm paths of October, 1889, and the extraordinary rainfall of that month, and the relation between the extreme northerly position of the storm paths and the marked deficiency of rainfall for October, 1890. The amount and distribution of rainfall dependent upon the latitude of the storms from the Japan current is one of the most important features of Pacific Coast weather, and is worthy of the careful attention of the public. According to the Signal Service report, the late spell of very warm weather was due to the extraordinary state of high barometer which during that time prevailed over this State and Nevada. At one time the barometer in Nevada registered 30.74 inches, 0.59 inches above the normal condition. At the same time the barometer at Roseburg, in this State, stood at 30.60. The former is the highest register ever known on this coast.

PRECIPITATION OF TIN.—The Journal of the Chemical Society gives an abstract of a paper on the "Precipitation of Tin from Acid Solutions by Metallic Iron," by B. Schultze. Tin is completely precipitated from solution in inorganic acids by the action of a mixture of metallic tin, metallic iron, and iron rust. The free acid is neutralized by the ferric hydrate, the stannic salts which are simultaneously formed are reduced by the tin to stannous compounds, and from these all the tin is thrown down by the iron. The operation requires several days for completion, and the absence of every trace of free acid and stannic salt is essential to success.

PHOSPHORESCENT INFECTION.—The curious discovery has been made that the phosphorescence frequently exhibited by the crustacea is infectious. A French naturalist, M. Giard, lately traced the phosphorescent light in *Talitrus* and other crustacea to bacteria in the muscles, which showed signs of disease. On inoculating healthy individuals, the same luminous appearance was produced. The disease runs a regular course, and the crustacea died in three or four days, the phosphorescence lasting a little after death.

PROGRESS OF THE ENGLISH LANGUAGE.—Ninety years ago the seven principal languages of Europe—English, French, German, Russian, Spanish, Italian and Portuguese—were spoken by 162,000,000 people. Only 21,000,000, or 13 per cent, spoke English. Now these languages are spoken by 400,000,000 people; and 125,000,000 of them, or 31 per cent, speak English.

A NEW PHOSPHORUS COMPOUND.—Prof. T. E. Thorpe, the well-known chemist, has discovered a new compound of phosphorus (P_4O_6), which takes the form of acicular crystals, melts with the warmth of the hand, and glows under the same conditions as phosphorus. It burns readily in oxygen and chlorine, and forms a new compound with ethyl alcohol.

SUBSTITUTE FOR CAMPHOR.—In view of the greatly augmented demand for camphor for the new uses found for it in the arts, with consequent enhancement of price, it is proposed to use naphthalin as a substitute for it in antimoth applications. It is quite as effective as camphor, and, being also equally volatile, leaves no more permanent smell.

ANOTHER NEW ELEMENT.—A new element, named "damaria," is said to have been discovered in the crater of an extinct volcano in Demaraland. It is reported to have an atomic weight of only 0.5, or half that of hydrogen, and therefore it is the lightest known substance.

BLACK SEA SOUNDINGS are said to show that below the depth of 600 feet the water is so impregnated with sulphurated hydrogen gas emanating from decaying animal and vegetable matter that living organisms are not found there.

THUNDER CLOUDS.—The explanation of the peculiar density of thunder clouds is said to lie in the fact that the vapor is partially condensed into drops by the electrical action.

SCIENTIFIC PROGRESS.—It is impossible to predict the boundary line of scientific discoveries, or the uses to which man may put them in the future.

GOOD HEALTH.

The Consumption Cure.

Nothing in the progress of medical science has excited such a sudden and world-wide interest as the recent discovery of Dr. Koch of a cure for consumption.

Dr. Koch has been seeking a cure for consumption for several years. He has conducted his inquiries from the first on the theory that consumption was caused by micro-organisms, although his medical confreres were at first disbelievers in the germ theory; but the doctor kept right on in that line. He began by pure cultivation of the bacillus, and found ethereal oils, tar pigments, mercurial vapors, salts of gold and silver, and especially cyanide of gold, efficacious in destroying the germ, *but this could not be done* in the *body* of animals without also destroying the animal.

"I continued my search," he said in a recent address, "and at last *found what I sought!* Susceptible as the guinea-pig is to the tubercle bacillus, it proved *non-inoculable* when treated with the substance in question. Even when the disease was *far advanced*, it could be brought to a standstill by this means."

This fact may give occasion to search for similar effective remedies in other infectious diseases also, and here lies the field for an international contest of the highest and noblest kind.

His preparation for this cure is a transparent liquid, which is injected subcutaneously, at first in infinitesimal, but gradually increased quantities. When taken into the stomach, it has no effect. The effect of the injection is to produce necrosis, or mortification of the tubercular tissue, in other words, to kill the bacilli in the lungs or in whatever organ attacked. Once killed, nature tries to expel the corpses, as it does with all dead tissues; and here the aid of the physician or surgeon may be required to complete its purpose. When the necrotic matter is expelled from the system the patient is cured, though the treatment should be continued for awhile in order to prevent fresh settlements of bacilli. Dr. Koch is careful to say that his system is only likely to succeed in the early stages of tuberculosis; where there are large cavities in the lungs, in which bacilli are lodged in great numbers, he doubts the power of the fluid to expel them; but in the earlier stages of the disease he is confined to be confident of the efficacy of his remedy.

The doctor keeps to himself the secret of his discovery. He has not revealed the material employed in its manufacture, or the method of its preparation.

It is said that patients who have been treated in the early stages of consumption have been freed from the morbid symptoms within from four to six weeks, when they may be regarded as healed. Consumptives with large cavities in their lungs will probably experience a benefit from the new remedy only in exceptional cases. In all cases, Prof. Koch emphasizes the necessity of early treatment. Only in the incipient stages of the disease, he declares, can the remedy fully develop its efficacy. He deprecates the mechanical and indiscriminate application of the remedy, holding it preferable that the treatment should be applied in suitable institutions where careful observation is possible.

This cure received its first great impetus during the World's Medical Congress which recently met at Berlin, and was attended by physicians from all parts of Europe and America. Since that time hundreds of medical men, not attendant upon the Congress, have visited Berlin to acquaint themselves with the treatment. Hospitals are also being established in many of the large cities in Europe and this country for this special treatment. It is said that there were some 1500 foreign physicians in Berlin on the 16th instant.

This treatment has been tried for lupus of the face—a variety of cancer—but has not proved altogether successful. In one case, treated by the doctor himself, it has again reappeared, as it generally does after treatment with the knife.

Can Cancer Be Cured?

Prof. Billroth holds that Koch's method places beyond a doubt that a remedy will be found before long for cancer. If the medical faculty of this State would only do its duty, it would be able to prove to the world in less than a month that there is already a "cure for cancer" in this city—that scores of cases which have been pronounced as unmistakably cancer by the leading physicians of this city and State and by many such in New York, Washington, and other Eastern cities, have been cured without the use of the knife or plasters.

Objection is made to investigation here for the reason that the practitioner, although a regularly licensed physician, refuses to divulge her secret. The medical faculty of Europe does not place such a hindrance in the way of investigation; for Dr. Koch, like our San Francisco physician, also refuses to reveal his secret.

Dr. Koch is not without his doubters, although about the only criticisms thus far have come from French medical men, some of whom advise incredulity until the *nature of the remedy is fully known* and scientific proof given of its effectiveness—thus following the footsteps of our San Francisco physicians.

The cancer cure discovery which now in a great measure lies dormant in this city, will soon be brought more prominently before the public. Active measures are already being taken to that effect. When the facts in regard to what has been done here in that direction are properly placed before the world, the excitement will be scarcely less than that which was attendant upon the discovery of Dr. Koch. Consumption and cancer are the twin demons of disease which have stalked through the world thus far with very little hindrance, but there is good reason to believe that they will soon be placed as completely under control as the smallpox has been by Jenner, and much more so from the fact that neither is especially infectious.

ELECTRICITY.

AN ELECTRIC WELL DIGGER.—Electricity is now being employed in this part of the country in the process of drilling oil wells, says the Pittsburg correspondent of the *Western Electrician*. This new electrical device, for which a patent has been granted to Wesley Webber, has the object of entirely supplanting the heavy tools and performing in a scientific manner the work which has hitherto been accomplished in a very crude way. The device is composed of a series of motors, placed in tandem and connected to one another, so as to practically form one motor. The reason for using the motor in tandem is to get the power within a 6-inch diameter, so that the entire mechanism, which looks like the common boiler, can be lowered in the well and the power applied direct at the bottom, which is the true plane of resistance in "making a hole." Projecting from this motor tandem is a rod, which resembles a piston-rod, working in and out of the cylinder; upon this rod the drill bits are firmly fastened and then the apparatus is lowered into the well in the ordinary manner. The mechanical construction and action of the apparatus is a close resemblance to the street-car motor. A number of tests, which have been made with the electric oil-well digger, were pronounced to be entirely successful.

HISTORY OF ELECTRIC LIGHTING.—Electric lighting, says M. Fontaine, did not make its appearance until near the close of the year 1873. It was in Paris, in November, 1873, in the workshop of M. Gramme, that the first installation, on a really industrial scale, of electric lighting took place, by means of a continuous-current dynamo and Serrin regulator. It was also in Paris, in 1877, that the Jablochkoff candle was first employed; 16 lights, distributed over a distance of about 1100 yards, being supplied by a single alternate-current Gramme machine. Paris, therefore, had the honor of possessing the first public and private lighting produced by means of electric current. M. Fontaine thinks that in 1891 or 1892 the electric lighting in Paris will require for its production motive force equal, in round numbers, to 32,000 horse-power.

ELECTRICAL PRANKS.—Under the title of "Electrical Pranks," a recent number of the *Engineer* notes some peculiar facts as to the effect of high-tension currents for power and light purposes on telephone and telegraph lines. If two wires are stretched side by side but not touching, a current sent through one of them will cause a current to flow in the opposite direction through the other as long as the first current is fluctuating. When this current becomes steady, however, all the inductive effect in the second wire disappears and no current flows. The majority of the dynamos now in use are alternating, or generators of current whose electromotive force alternately rises and falls. A current from such a machine is constantly fluctuating, and consequently always tends to set up induced currents in other wires.

A REMEDY FOR TELEPHONE INTERFERENCE seems to have been found in the method of track wiring adopted by the Albany and Troy road, provided that long practice demonstrates that the experiment is a practical success. The method as described in the proceedings of the Rochester convention consists in grounding the return wire at intervals in deep wells or connecting it with metal rods driven ten or fifteen feet into the ground. It is claimed by this method that a better return is secured and all telephone disturbance avoided. Certainly this is an important discovery, and further experiments in this direction should be made.

NEW ELECTRIC CLOCK.—The new form of clock soon to be manufactured is certainly an apparently radical departure from the present style of clock. Winding is entirely dispensed with. An electric battery is concealed in the clock, and motion is given to the pendulum by simply opening and closing the circuit, in which action a little magnet assists. Charging the battery occasionally is all the care needed. The clocks are to be manufactured by the Waltham Electric Clock Company, Natick, Mass.

CARE OF LAMPS.—To secure a brilliant, white light, a lamp needs a thorough cleansing every little while. The oil should be poured out of the fount, leaving no dregs on the bottom. The fount should then be washed in strong soapsuds, rinsed in warm water and dried. It should then be filled with fresh oil. The burner should be boiled in soda and water until the network that crosses it is freed from dirt and dust. If the wick has become clogged with the sediment, replace it with a new one.

USEFUL INFORMATION.

THE SMOKEBALL IN WAR.—In the sham fight at Portsmouth in honor of the Emperor William, an advancing column was so affected by the fumes of the smokeball, which was used to raise a cloud of impenetrable obscurity under which they could advance, that the men had to keep their hands to their noses to avoid suffocation. It is now proposed that the smokeball shall receive a further development. It has occurred to some military men that instead of half suffocating their own troops, it would be better to follow the example of the Chinese pirates with their stinkpots, and asphyxiate the enemy. A Vienna scientist has accordingly invented a bomb of such power and virulence that every one who is within a certain radius of it when it explodes is rendered unconscious. Devices such as these would soon modify the art of war, and probably the next development will be an anti-asphyxiating bomb, whose fumes will neutralize that of the other. It is said that many years ago a scheme based on the throwing of poisonous gases over a tract of country was put before the War Office in England, for the purpose of devastating the country in the face of an invading army, but the agency employed was so terrible in its effects that it was not made public, and was consigned to the secret records of the War Office.—*Ex.*

STATISTICS OF STEAMBOAT TRAVEL.—Inspector-General Dumont of the Steamboat Inspection Service has made a report to the Secretary of the Treasury of the operation of that service during the fiscal year ended June 30th last, of which the following is a recapitulation: Total number of vessels inspected, 7065; net tonnage, 1,390,389 55; number of officers licensed, 33,237; increase in number of vessels inspected over preceding year, 338; increase in tonnage, 74,953 48; increase in number of officers licensed, 1615. During the year there were 1882 applicants for pilots' licenses, of which number 1738 passed a successful examination for color-blindness and 44 were rejected. There were 34 accidents, resulting in the loss of 245 lives—a decrease of 56 as compared with the preceding year. Of the accidents, 17 resulted from collisions, and 102 of the lives lost were by drowning. Of the number of lives lost, 65 were passengers and 180 were officers or persons employed on the steamers.

HOT WATER ON TAP.—In Paris in districts settled with poor families there are to be found nickel-in-the-slot stands, into which a 5-centime piece (equal to our copper cent) can be dropped, which will allow a button to be pressed that will immediately cause a stream of boiling hot water to flow until nine quarts have been delivered, when it stops. This is found to be a great opportunity for economy with poor families—the cost of hot water so obtained being much less than it would be if a fire had to be made to heat it. Water is thus obtained chiefly for washing. The water is also thus used by Paris hackmen in cans, to keep the feet of their customers warm in cold weather.

MIXING NATIONALITIES.—The present Russian Chancellor is a Swede; the late Persian Ambassador in London was a Scotchman; an Irishman was three times Prime Minister of Spain, and a Celt. MacMahon, was President of France. The Russian Ambassador at Paris is a German, the French Ambassador in London is an Englishman, and the Italian Ambassador in Berlin is a Frenchman. The chief consulting Admiral of the Turkish fleet is an Englishman, as was also the late Admiral of the fleet.

TO CLEAN LACE, fill a bottle with cold water, drew a stocking tightly over it, securing both ends firmly. Place the lace smoothly over the stocking and tack closely. Put the bottle in a kettle of cold water containing a few shavings of soap and place over the fire to boil. Rinse in several waters and then drain and dry. When dry, remove and place smoothly in a large book and press with weights. Very nice lace can be made to look like new by this process.

WATER WASTE.—It is estimated that water leaking through a hole just large enough to pass a needle through, during 24 hours, at a 14-pound pressure, would be sufficient to supply a house for a day. The waste through a one-inch pipe under the same conditions would be 1140 gallons.

AMONG the industries of New York there are women who can make tins, tools, trunks, trusses, harness, saddles, traveling bags, pocket-books, jewelry, coffins, wooden boxes for cigars and grocery supplies.

THE Crosby Steam Gauge and Valve Company of Boston manufacture a chime whistle, which is musical and a great improvement over the harsh and noisy things in use at the present time by many firms.

MIX STOVE BLACKING with spirits of turpentine. It will take off the rust, polish easier, and will stay glossy longer than when water is used.

SCRAP STEEL.—Utilizing scrap-steel rod by welding it and drawing it into fence wire is one of the recent successes of electric welding.

ENGINEERING NOTES.

NEW METHOD FOR SUBMARINE FOUNDATION WORK.—According to a German publication, Herr Fr. Neukirch, in Bremen, Germany, has devised a new method for foundation works which has proved practically valuable by actual application. His object is to solidify sand under water by introducing into it powdered cement by means of compressed air blast. An iron tube, somewhat pointed and perforated at the end, reaches the base of the intended foundation, and is connected, through a rubber hose, with a compressed air plant, and can be lowered end raised by means of a windlass. The area to be covered by the foundation works is divided into greater or smaller parts, according to the desired depth, so that the tube to be inserted in each is sunk in distances varying from 20 to 30 centimeters. The quantity of cement to be deposited changes also in proportion to the depth to be attained, and when calculated is filled with a special iron reservoir through an adjustable funnel, and thus ready to be let into the air current down the tube in a spray-like blast. The strong air current issuing from the holes in the end of the tube facilitates the sinking of this to such an extent that in a pure sand bottom it will penetrate four inches within 30 seconds. On reaching the desired depth, the cement is poured down, and with the air blown into the sand while the tube is being slowly raised. The blast gives rise to a boiling movement of the water and sand whereby the cement is thoroughly mixed with the sand and thus solidifies the bottom. The cement remains hard, just as concrete, during several weeks.

A RAILROAD TO ALASKA is one of the sure things of the near future. The latest information in this direction is that arrangements have been concluded and capital raised by a syndicate of St. Petersburg, Russia, capitalists and some prominent New York railway magnates, among whom are Henry Villard, to build a railroad from Puget Sound to Alaska. There have been many wild transpacific and transatlantic schemes, such as bridging Behring straits and establishing a steamship line to Europe from Hudson's bay; yet none a few years ago appeared more chimerical than the proposition to build a paying railway through the frozen wastes of Alaska. But now considerable interest is manifested in schemes of this kind. Alaska has many enthusiastic admirers who look on it as the coming land of wealth and promise. What Jay Cooke did in booming the Lake Superior country, Villard and his friends propose to do for Alaska. Engineering parties have been in the field all summer, and it is expected that the line will be located next spring. The company has a capital of $1,500,000.

THE PROPOSED TUNNEL BETWEEN IRELAND AND SCOTLAND.—A public meeting, convened by the Mayor of Belfast, has been held to consider a scheme for constructing a tunnel between Ireland and Scotland. Mr. Burton, civil engineer, submitted his scheme, which is to construct a tunnel from the junction of the Belfast & Northern Counties Railway, four miles inland from Whitehaven, on the Antrim coast, to the center of Wiereton Hill, in Wigtonshire, also about four miles inland, the whole length to be about 34 miles. The scheme has the support of Sir Douglas Fox, engineer of the Severn tunnel, Sir Benjamin Baker, the Forth bridge engineer, and Sir John Hawkshaw of London. He estimated the total cost at £8,000,000, and the tunnel could be completed in 10 or 12 years. The meeting passed resolutions recognizing the importance of the scheme, urging the Government to render financial assistance, and appointing a committee to consider and report upon the whole question.

FEATHERING PADDLE-WHEELS.—It is not generally understood, we believe, that feathering paddle-wheels were in use as far back as 1830, when a patent was granted to one Elijah Galloway, and sold by him to William Morgan, and became known as Morgan's wheel. Later a Mr. Seward made some improvements which rendered the operation more satisfactory. There was also tried in 1833 a cycloidal wheel which consisted of dividing the paddle into a number of parts which were placed upon the wheel in the curve of a cycloid, so they entered the water at the same spot and followed one another so rapidly as to cause little resistence and afterward separated to afford full scope for their action in passing the center, and coming out, allowed the water to escape readily from them. That feathering paddles have not been used more often in this country is the occasion of some surprise to English engineers.

A NEW ENGINEERING FEAT.—A divided steel steamer, the Mackinaw, of 2578 tons, has been sent down the canals to Montreal, to be reconstructed there previous to her shipment to New York. The Mackinaw was built at West Bay City, Mich., was taken to the drydock in Buffalo, N. Y., and there cut in two to enable her to pass through the St. Lawrence canals, and she was passed through about 42 canal locks in 11 days. This is the first steamer built on the lakes and thus transferred to the transatlantic trade.

THE amounts appropriated by Congress for Oregon rivers and harbors for the past three congressional terms are as follows: 1886, $598,250; 1888, $1,178,500; 1890, $1,507,100.

Passing Events.

Among other important events of the past week that failed to occur was the much desired and greatly needed rainfall, nor are we advised as to when it may be expected to put in an appearance. The early rains having been withheld, we await now the later, trusting to the promise that it will not fail to make its advent.

Reports from the mineral regions continue favorable, the prolonged dry weather hurting the mining less than almost any other of our leading interests. To those engaged in river-bed mining, the longer the rain holds off the better. Thus it happens that the Golden Gate Company, operating near Oroville, have, through the continued low stage of the water in Feather river, been enabled to take from their claim astonishing quantities of gold.

The late threatened outbreak among the Indians is likely to reach an early and favorable termination, the promised Messiah having failed his followers on the "grub" question. Truly the way to rule the Redskin is through his physical wants, more especially those that go to supplying his gastric and digestive apparatus. The "braves" continue to quietly feed at "Uncle Sam's" crib.

Electrocution stands in New York, the Supreme Court of the United States finding the law providing for this method of inflicting capital punishment to be both legal and constitutional. A Japanese murderer lying in a New York prison under sentence of death will now be electrocutionized.

The recent attempt at revolution in Honduras has been squelched and the principal revolutes shot.

A People Who Have Much to Be Thankful For.

The late Thanksgiving Day was, throughout California, observed after conventional methods—a little church-going and much gluttony. But if our people, in their eagerness to enjoy the good things of this life, punished a few of the bad ones as well, this must be overlooked. The public gratitude would, on this occasion, have met with heartier expression had the day been preceded by a drenching rain, which, however, it is only safe to pray for on a falling barometer. These appointed Days of Thanksgiving and Prayer must be construed to mean some thanks for favors received and some importunities for favors withheld; thanks at these times being given with some "mental reservation." Mortal man is diplomatic, especially the farmers, as witness their course in the late election.

But, notwithstanding a drouth, protracted beyond the usual limit, the people of California have much for which they should be grateful. They should be grateful for their splendid climate and productive soil; for their gold mines and other well-assured sources of wealth; for their exemption from widespread disease, the cyclones, tornadoes and destructive storms to which their brethren in the East and the inhabitants of most other lands are exposed. Above all should they be thankful for their deliverance from the absurd and tyrannical forms of government that oppress other peoples. They ought to rejoice and be exceeding glad that they live in a country where the hard-fisted "rail-splitter" and the boy driving on the towpath can if deserving be raised to the Chief Magistracy; where there are no established churches or established aristocracy, no privileged classes or humiliating distinctions; where a man can assert his manhood; where there is freedom without license and protection without surveillance; all having the same chance to succeed, all being equal in the eye of the law. These are great blessings and should not fail of due appreciation on the part of those who enjoy them.

"Going West"—What the Term Has at Different Periods Implied.

It is not more than 80 or 90 years since the term "going West" meant, with the people of Virginia, moving over the Blue Ridge; with the people of Pennsylvania, emigrating beyond the Allegheny mountains; while in New York a removal to Genesee valley, about the center of the State, was looked upon as "going West." Later on, emigrating to Ohio, Illinois, Michigan and Indiana, each in its turn was considered "going West," up till about 1840 everything beyond the Mississippi being regarded as "the Far West!"

Since California became the *ultima thule* of westward immigration, it is no longer easy to say just where the "West" is. Practically, the dwellers on this coast have no occident. Where the inhabitants of our Oriental States now locate the "West" we are not advised. We suppose they continue, as of old, to speak of the central group of States as the West, though with us they lie so far to the east. Our geographical nomenclature in this, as in some other respects, calls for amendment. We require at least a new classification of the States. The Republic should be divided into the Northern, Southern, the Middle or Central and the Western States, the latter taking in all west of the Rocky mountains, while the Middle or Central group takes in all between the Rockies and the Mississippi river, except such portion of Louisiana as lies west of that river. The Northern tier of States might properly be made to comprise all the territory north of Virginia and Tennessee.

Grouping the States in the manner here proposed and naming the several groups according to their geographical positions would enable us to fix the "West" somewhat definitely and give to these other subdivisions of the Republic more precision than has been the custom.

The Outlook for Our Various Mining Industries.

There has occurred within the past few months a marked appreciation in the prices of nearly all our mineral and metallic staples. The tendency of the whole market has been upward. Lead, tin, silver, coal, copper, iron and antimony have all advanced from five to ten per cent on former prices; the rates before paid for salt, quicksilver, borax and most other mineral products of minor importance having at the same time been well maintained.

Nor has this upward movement been the result of speculation or an attempt to forestall the market. It has, for the most part, been based on demands incident to increased use and consumption, the supply in many instances having been insufficient to meet requirements. The appreciation has therefore been solid and healthful. It is for this reason all the more gratifying, as it argues for this movement steadiness and permanence. It has grown out of a great industrial activity, and will hold as long as this condition of affairs shall obtain. That it will not be short-lived may be counted upon, now that our home interests and industries are to be well protected against foreign competition.

While this policy on our part may provoke retaliatory legislation in England and elsewhere, it cannot seriously affect our mining and metallurgical industries. These open to our enterprise in China, Japan, Africa, Mexico, Central and South American fields are so vast that we can well afford to dispense with the limited market afforded us in this line, either in Great Britain or on the Continent of Europe. Should Mr. Blaine's plan of reciprocal trade be somewhat extended with the Republics of South America, we would be able to supply them with vast amounts of machinery and other manufactured articles, either exchanging them for the products of these Republics or disposing of them for cash. Brazil and the Argentine Republic, when their affairs, financial and political, shall become a little more settled, will alone take from us more of our surplus products and wares than all Europe. These countries are new and of vast extent—their natural resources being simply astounding. They are destined to develop these resources and increase rapidly in population, rendering their trade an object of the first importance.

Confining our views to our own country, the outlook here is full of encouragement. Railroad construction, shipbuilding and similar pursuits into which iron, copper and lead largely enter, having lately received a decided impetus, it may be expected that the call for these metals will continue large. The promised growth of mining for gold and silver, while it will also absorb much iron, will stimulate quicksilver production to a corresponding degree.

As for copper, its future is especially bright. Although the price of this metal, on the collapse of the French syndicate, met with a sudden and fearful tumble, it has since been restored to almost the highest figure reached during the supremacy of that powerful but overambitious combination. The executors of that body have just disposed of the last of its holdings, and this without creating a ripple on the surface of the market, which could have absorbed much more without causing serious disturbance.

With this menace removed, the copper industry is restored to its normal condition, imparting to the market a steadiness and to the whole business a confidence that for several years before it had not enjoyed. In the future, production and consumption will be likely to go hand in hand. The former will be large. With the prices now ruling, this is inevitable, yet these two factors may safely be left to regulate each other. Requirements for electrical purposes, already large, will be likely to increase enormously hereafter. The employment of the sulphate of this metal in viticulture will furthermore enlarge the field of its usefulness immensely, even though this use be not extended to other plants than vines, as it undoubtedly will be. As an alloy with other metals, copper is all the while growing in importance.

What is said here of copper applies measurably and in a general way to lead, tin, coal, borax and many other of our mineral and metallic products, for all of which the demand, keeping pace with our progress in industrial expansion and population, will rapidly increase hereafter. Upon the whole, it may justly be said that the outlook for the business of mining, considered in a broad sense, may be regarded as very hopeful, fully as much so as that of any of our other leading industries.

Further Silver Legislation.

Probably one of the first subjects that will receive attention from Congress is that of silver. The money stringency at the East has demonstrated beyond the cavil of a doubt that the present law does not meet the business requirements of this country. At the time the bill was passed requiring the purchase of 4,500,000 ounces of silver a month, the MINING AND SCIENTIFIC PRESS took occasion to criticise the bill and stated that it would prove a failure. With a population almost equal to that of both England and France, with an internal trade far in excess of either, and an export trade second in rank, yet the circulating currency of the country is not equal to that of France. No country can expect to be exempt from extreme depressions or extreme high speculative prices which is deficient in money so as to prevent moneyed speculators from unduly depressing or inflating values of leading securities or commodities by making money scarce or plentiful, as desired, to better carry out their schemes.

This statement is well illustrated by the way the late panic in stocks at New York was worked to the advantage of a moneyed few. By making money plentiful and publishing glowing reports of expected large "booms" in all speculative securities, the more credulous of the public bought quite heavily—many loading up beyond their means. With the first ripple of an approaching storm, the capitalists who had not only unloaded but shorted the market began to create distrust by publishing exaggerated reports of the situation and at the same time withdrawing money from the market. The withdrawing of funds created a fictitious scarcity of money, necessitating bankers and large money-lenders to call on their patrons to make their accounts safe. At each call securities had to be thrown on the market, and at each unloading prices gave way still further, until all that could be secured had been given up by outsiders. With this an accomplished fact money began to grow easier and the schemers were ready for another bull movement to unload at a good profit. This is no new way of running corners and deals. It is a notorious fact that the Goulds have done so before in manipulating railroad securities, as have the Armours in running deals in wheat, corn and provisions. It is through these that their colossal fortunes have been acquired.

With silver placed on a footing with gold, no such successful manipulation can be done by the few against heavy losses of the many. For by the free coinage of silver, the price of the metal would at once be advanced to par, and the currency of the country increased to meet the demands of business. Of necessity, free coinage of silver does not signify that it shall be coined at once, for the Mint capacity is not equal to it, but as in the case of gold, Treasury notes be issued against the silver at par value, deposited in the Mints for coinage.

The Next Report of the State Mineralogist.

The Grass Valley Daily *Union*, in speaking of the forthcoming report of Wm. Irelan, Jr., State Mineralogist, expresses the opinion that it will be the most complete of the entire series of reports emanating from the Mining Bureau, an opinion in which we are inclined to concur, as this volume will treat fully of the geology, lithology, minerals, soils, climatology, statistics and general resources of the mineral regions brought under special consideration. The book will contain over 50 maps of different mineral districts, which is a new and valuable feature of these reports. Mr. Irelan has had capable assistants in the field, wherefore he will be enabled to present a report that while it redounds to his own credit, will deeply interest a large class of readers and tend to promote the mining industries of the State. The manuscript for this volume, having for some weeks past been in the hands of the State Printer, is now nearly all in type. The book, which will be ready for delivery early in the new year, is bound to be in great request, especially among the miners. It is to be hoped that a large

edition will therefore be printed, to the end that all requiring it may be supplied. Nor should the edition be restricted to barely enough to meet present requirements. Future wants should be anticipated, to the end that they may be met when they arise.

Of the seven volumes of these reports, all that preceding the last two have been exhausted and are now out of print. Those books at present command high prices, being much sought after, though by no means so valuable as the one now about to issue from the Bureau.

We stated in the columns of the PRESS not long since that we would procure each of the earlier reports of this series as could he had and forward them an application.

This promise we will have to recall, as we find on inquiry that none of these earlier editions are to be had. The later ones—that is, those of 1888 and 1889, constituting the eighth and ninth volumes of the series—can be procured by addressing the State Mining Bureau, San Francisco, California, and inclosing the necessary postage—23 cents for Volume 8 and 11 cents for Volume 9, of which the State Mineralogist has still some copies left.

On Certain Magnetic Rocks Recently Found in Arizona and California.

[A paper read before the San Francisco Microscopical Society, Nov. 19, 1890, by HENRY G. HANKS, F. G. S.]

At Tucson, Arizona, recently, I discovered on the summit of a low, conical mountain, a mile or more from the town, a great quantity of what seemed cellular lava or basalt in broken fragments lying on the surface, specimens of which I have brought this evening for your inspection.

I was led to ascend this hill called "Sentinel Hill" or the "Sugar Loaf" partly by a desire to enjoy a view of the beautiful Santa Cruz valley, partly in search of geological information and to discover the source of the building stone used in Tucson; but more perhaps to study the formation of bowlders and to collect examples of their natural weathering, as observed in California.

The road from the town southwesterly crosses the Santa Cruz river at a distance of about a mile and continues nearly the same distance to the hills or spurs of the Sierra Tucson. Sentinel Hill is an outlier of the range, and rises several hundred feet above the mesa. From a distance the rocky hillsides seem to be destitute of vegetation, but a nearer examination reveals the presence of numerous cacti, long and cylindrical, resembling piles partly driven into the ground; these are the "Cereus giganteus" which give character to the desert hills of Arizona, and are called "Suwarrow" by the Mexicans. Some of them are 16 feet high; they have no sylvan character and add nothing to the beauty of the landscape. Clumps of the curious "opuntia" and a great number of smaller cacti abound.

The road leads up to a quarry of gray stone, which is largely used in the foundations of well-built adobe houses of the town.

When the inhabitants of Santa Cruz valley require building stone in unlimited quantity, the supply will be found ample.

I found the summit literally covered with large angular and sub-angular fragments of dark-colored cellular rock mentioned, fragments of which gave when struck the ringing sound characteristic of phonolite. The study of these rocks is very interesting. The lighter gray variety revealed at the stone quarry partakes somewhat of the character of the so-called "white lava" of California. The sharp high summits of these hills are basalt-like cellular and of a darker color; but a close observation of the two rocks shows them to be the same—either changed, formed or ejected under different conditions.

I am inclined to the opinion that the soil of Santa Clara valley is largely composed of these rocks disintegrated. There is no sign of aqueous formation, but continued observation makes an igneous origin more doubtful. Like Sentinel Hill, Picacho and Desert peaks seem to be of this formation.

Above the gray stone may be seen a breccia of the same rock united by a calcareous cement, apparently an infiltration or deposit from a mineral spring or springs; the analysis shows the source of this lime.

A short distance from the summit I noticed what seemed to be slate, but a closer examination showed the rock to be the same, but rendered slaty by pressure. I noticed also that the air-cells were elongated in a direction at right angles with the pressure; this proved to my mind that the rock must have been plastic. At the risk of being criticised, I admit my doubts as to the igneous or even Plutonic origin of these rocks, although I believe they would be generally so classed, and until I have some new evidence to the contrary, I shall believe them to be metamorphic sediments. My reasons for holding this opinion cannot be stated in a few words, nor are my investigations complete. A detailed dissertation on the lithological character of these extremely interesting rocks would be foreign to the purpose of this paper, which is to call attention to their polar magnetism.

On the road to the summit, the same disposition to weather into spherical forms was seen, as frequently observed in California and elsewhere; the hillsides were covered with globular pebbles of the phonolitic rock, so numerous that they were the rule rather than the exception. I have brought a typical specimen this evening for your inspection. Examples of howlder weathering are so common at this locality that no unprejudiced mind would venture to gainsay the theory of their formation.

On the following day, while examining the basaltic fragments, I held one of the largest to the needle of my compass, and was much surprised to see it repelled instead of attracted. Realizing instantly that I held in my hand a natural magnet, I reversed the specimen and saw the needle strongly attracted.

These unexpected results led to a critical examination of the mineral; it was not magnetite, but a genuine rock specimen resembling basalt. A polar basalt being new to me, I began on my return to San Francisco a thorough reference to authorities in my library, but failed to find any allusion to such a property in basalt or any similar rock.

Spallanzani, in a description of his ascent of Etna, mentions a black, scoriaceous lava, the dust of which "copiously adhered to the point of a magnetized knife, and small pieces put the magnetic needle in motion at the distance of two lines." But if these rocks were polar, like those of Sentinel Hill, he did not discover it.

It is well known that metallic iron occurs in basalts in Bohemia and Greenland. Daubree thinks this iron was brought up from the interior of the earth with the basalts during eruption. Iron is plentiful in the basalts of Disco Island, on the western coast of Greenland, but I have no information of its being formed into bands possessing polarity, which may be the cause of the remarkable properties noticed in the Tucson rocks. When this polarity was thus discovered, a crucial experiment was made as follows: The large piece which I exhibit this evening was floated in an evaporating dish placed in a larger one filled with water. After several hours the magnetic poles of the rock fragment had moved to coincide with the magnetic meridian of the earth, in obedience to the subtile, invisible spirit which lurks among the stony particles.

A remarkable meteorite was found many years ago 20 miles from Tucson, and eight miles from the road to Tubac. United States Commissioner Bartlett, who visited Tucson in July, 1852, saw it in a blacksmith's shop used as an anvil. It was of metallic iron, weighing about 600 pounds. Its greatest length was about five feet. It was figured on Fol. 298, Vol. 2, personal narrative. Bartlett was informed that there were larger pieces at the same locality. There were other masses in the town also at the time of his visit. The first mentioned meteorite is now, I believe, in the Smithsonian Institution at Washington. These facts may have some significance in this connection.

The rock from the quarries is compact, and breaks easily with conchoidal fracture. The basalt-like, overlying cellular rock in general appearance resembled the so-called andesite of the deep gravel mines of Plumas and Sierra counties in California. When long exposed to the elements the outer surface is to a certain extent weathered and metamorphic to a depth of from three to five millimeters. The air-cells vary from several inches in length to very minute ones.

In some cases signs of metamorphism may be seen on the crateriform margins of the broken cells, specific gravity, 2.288, easily pulverized, dull, color red-gray, streak lighter, hardness, 6 (scratches and is scratched by a crystal of orthoclase), cellular, polar magnetic, powder not attracted by bar magnet except a few particles; does not decompose water in presence of sulphuric acid. B. B. rather large fragment fuses of edges to a gray, glassy slag, which is not magnetic; gives water in closed tube.

Under a low power objective, the surface is seen to be peppered with small amorphous particles of dark color, resembling magnetite, or meteoric dust. When a small surface specimen (itself a perfect natural magnet) is presented to the needle, the deflection both attractive and repulsive is found to be greater in proportion to size than that caused by the larger one from which it was broken. I am preparing rock sections, the microscopic study of which promises to be of great interest. A fragment weighing 4.5 grams deflects the needle five degrees, while the larger one weighing 820 grams moves it but 20 degrees. The attraction of the large specimen is felt in the compass at a distance of 17 inches.

Microscopically examined, the rock is crypto-crystalline, light-colored on broken surface, nearly white on weathered face. On the fresh fracture an amethyst-colored mineral and a glassy feldspar may be observed. The vesicles and cellules are not generally internally coated with other minerals, although there are some exceptions.

A chemical examination has the following results: The rock contains silica, 54.80; lime, 6.34; oxide of iron and alumina (alumina doubtful), 26.60; water (loss by ignition), 1.80. With the exception of the silica, lime and loss by ignition, the results were too quickly obtained to be more than approximate. A very careful analysis will be made in the future.

I carefully subjected all the igneous and plutonic rocks in my collection to the test, but only those obtained near Laporte, in Plumas county, California, proved to be polar. A few from other Pacific Coast localities were slightly magnetic, but none of those from Ætna, Vesuvius, Mauna Loa or other noted volcanoes seemed to affect the magnetic needle in the slightest degree; but that some rocks of Plumas county are polar materially broadens the field and adds interest to this subject. These rocks are generally considered as andesite; darker colored ones containing olivine are classed as basalt, but as they generally merge into each other, it is not easy to draw a line of demarkation. I can now trace a resemblance between the polar rocks of Arizona and California at the localities mentioned, but those of our State are not generally cellular and the attraction and repulsion are not nearly so apparent in them as in those from Tucson.

The field of inquiry opened by these discoveries affords a rare opportunity for investigation. It will be particularly interesting (knowing that the great mineral belts bear generally with the magnetic meridian) to inquire if this polarity is inherent in the rocks or is imparted to them by terrestrial currents, and what influence these attractions may have on the deposition of metals in mineral veins.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 18, 1890.

440,837.—EXERCISING DEVICE FOR MUSICIANS—E. S. Bonelli, S. F.

440,736.—SEED-PLANTER—R. E. Brakey, Ventura, Cal.

440 838.—HOSE REEL—R. S. Chapman, S. F.

440,839.—TICKET PUNCH—A. W. Coffin, S. F.

440,769. —NUT LOCK—A. A. Dickie, Suisun, Cal.

440,948.—KNIFE CLEANER AND POLISHER—T. A. Evans, S. F.

441,061.—LEVER FOR MOVING CARS, ETC.—W. H. Garlock, Seattle, Wash.

440,843. —THRASHER AND CLEANER—G. W. Haines, Stockton, Cal.

440,846.—LOCK—H. O. Hooper, S. F.

440,864.—STEAM JOINT—H. T. Knight, South Riverside, Cal.

440,829.—GUARD FOR GANG EDGERS — Jos. Korbel, S. F.

440,867. — VEHICLE RUNNING GEAR—J. W. Leete, Carson, Nev.

440,831.—SECURING EXTRA LEAVES IN BOOKS—J. T. McKean, Santa Cruz, Cal.

440,921.—EXPLOSIVE—D. Mindeleff, S. F.

440,830.—TREATING COAL TAR—A. L. Munson, Oakland, Cal.

440,749.—GUARD FOR CARS—G. Rischmuller, S. F.

440,832.—COMPOSITION FOR PROTECTING PILES—James Rowe, S. F.

441,040.—CABLE RAILWAY CROSSING—P. Somerville, S. F.

440,932. — MAIL-BAG—C. P. Tatro, Spokane Falls, Wash.

440,853.—GATE—C. W. Thompson, Tomales, Cal.

440,675.—STAMP-CANCELING MACHINE—S. B. Whiteside, Los Angeles, Cal.

440,835.—STENCIL-CUTTER—J. F. Wickman, S. F.

20,340.—DESIGN — N. A. Wheeler, Alpowa, Wash.

The following brief list by telegraph for Nov. 25, will appear more complete on receipt of mail advices:

California—John Ellis, Stockton, vise pipe-tongs; John T. Grant, San Jose, harrow; John C. Jones, Napa, fermenting tank wine-strainer; Robert Simpson, Hanford, cultivator; George W. and F. P. Stedman, S. F., suspension bridge; Edward D. Stodder, S. F., wave-power motor; Isaac F. Thompson, assignor of one-half to W. L. Palmer, S. F., cut-off valve gear.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TICKET PUNCH.—Arthur W. Coffin, S. F. No. 440,839. Dated Nov. 18, 1890. This punch belongs to that class in which the amount paid by the passenger is indicated upon the ticket by means of punch marks made by the conductor before delivering the ticket to the passenger, while a duplicate of the ticket is retained within the case of the punch as a check. It consists of a circular support rotating within the case and having a series of punches or indicators arranged around its periphery, a means for turning this movable punch-carrier to bring any figures which may be desired into line above the tickets, and a lever device for depressing the desired punches to mark the ticket.

GUARD FOR GANG-EDGER. — Joseph Korbel, S. F. No. 440,829. Dated Nov. 18, 1890. The object of this guard is to prevent injury to workmen who, in the operation of gang-edgers, frequently have their hands and arms drawn in by the feed rollers and badly mutilated. The guard consists of a supplemental roller journaled in front of the upper feed roller and rotating in an opposite direction. This roller is of smaller diameter than the feed roller, so that the lumber will not come in contact with it, and it will, therefore, in no way influence the feed. It is, however, so near the surface of the lumber that if by accident the workman's hands approach too near, the outward rotation of the guard roller will prevent them from being carried into the machine.

STENCIL-CUTTER.—James Frederick Wickman, S. F. No. 440,835. Dated Nov. 18, 1890. The essential novelty in this machine lies in the punch which has its cutting face on a bevel or slope beginning to a point, and its edges terminating separately in about a vertical plane, and in different horizontal planes. The object of this construction is to effect a shear-cut in connection with a flat-faced die on which the material rests. The cutters are all arranged about the periphery of a plate, below which is a similar plate carrying the dies. A presser-arm above is adapted to force the punches down, and means are provided for adjusting the plates to admit and remove the material. The machine is a simple and serviceable one, the punch of which is adapted to cleanly cut the material with the exercise of but little power.

PROCESS OF TREATING COAL TAR.—Anson L. Munson, Oakland, Cal. No. 440,830. Dated Nov. 18, 1890. The purpose of this process is to make from coal tar a quick drying oil which may be used as a vehicle for paints. The coal tar is first subjected to a certain heat, and has then added to it a saturated solution of chloride of zinc and oil of turpentine. In the operation, the heat is maintained without driving off the lighter volatiles, and until the solids are melted to a degree sufficient to be acted upon by the solvents. The chloride of zinc is added, and the mass agitated, and during the agitation the oil of turpentine is added and the mixing continued until the turpentine is thoroughly incorporated. The tar thus treated is permanently changed into a limpid oil. The chloride of zinc acts as a deodorizer, neutralizes the acids, and is a partial solvent. The oil of turpentine is the solvent for the whole. The oil thus obtained readily combines with metallic or mineral substances to form a quick drying paint of great beauty and durability which may be used as a marine paint, and for iron and wood protective coatings, and other purposes.

DEVICE FOR SECURING EXTRA LEAVES IN BOOKS.—John T. McKean, Santa Cruz, Cal. No. 440,831. Dated Nov. 18, 1890. This device is especially applicable for securing extra leaves in hooks which are already bound, these leaves being used for taking notes, advertising and other purposes and being removable or interchangeable at pleasure. It consists in a series of flexible threads or filaments passing through the folds of the supplemental leaves, and a means for attaching the threads at opposite ends.

UNIVERSAL STEAM JOINT.—Henry T. Knight, South Riverside, Cal. No. 440,864. Dated Nov. 18, 1890. This joint is especially applicable to pipes for the transmission of steam or fluid under pressure where it is necessary to change the direction from time to time. It is useful in quarries and other places where the engines are frequently moved from one place to another, while the boiler remains in one position. It avoids the customary use of lengths of hose which are somewhat expensive and are burnt out quickly, thus necessitating constant and expensive renewals. The joint consists of a body having four openings, two of which are closed by screw caps, while the remaining two have their inner ends beveled or expanded, rotary sleeves at right angles with each other, and their inner ends expanded and fitted in the expanded ends of the openings, screw caps fitted to the extended ends of the body, and packing rings within the screw caps fitting against the ends of the extensions.

HOSE REEL.—Rockwell S. Chapman, S. F. No. 440,838. Dated Nov. 18, 1890. This reel belongs to that class adapted to be permanently secured to the walls of buildings in convenient positions whereby the hose wound thereon can be drawn off for use in case of emergency. The invention consists in the novel rotary joint by which the water connection is effected, and also in the guiding device on the front of the reel for directing the hose properly in any direction when being drawn off. The joint is a simple and effective one, admitting of the rotation of the hose reel, and is self-tightening. The guides are rollers neatly and serviceably placed, to direct the hose without friction.

TRAVELING THRASHER AND CLEANER. — George W. Haines, Stockton, Cal. No. 440,843. Dated Nov. 18, 1890. The object of this invention is to improve the cleaning mechanism of traveling harvesters or other thrashers and cleaners by a peculiar construction and operation of the shoe which carries the sieves, and a means for changing the motion from a plain end shake to a combined end shake and vertical tossing motion, the amount of this motion being regulated to suit the quality of the grain while the machine is running. It also relates to an improved construction of chain driving and sprockets, by which the power is transmitted from the main driver by a single chain and distributed from this to the thrashing and the separating and cleaning parts of the apparatus.

LOCK.—Henry Otis Hooper, S. F. No. 440,846. Dated Nov. 18, 1890. This invention relates to that class of door-locks which are also used to latch the door without locking it. It consists of a reciprocating latch bolt and knob, which may be turned to withdraw the latch and open the door; and in connection with these of a hollow spindle, sleeve and locking devices which are operated by a key introduced through a small opening in the knob, so that the latch bolt is prevented from being withdrawn, and then serves as a lock for the door.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

GREAT REDUCTION!

BATTERY SCREENS.
Best and Cheapest in America.

PERFORATED SHEET METAL
For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.
Inventor and Manufacturer of the celebrated Slot Cut hurred and Slot Punched Screens.
Mining Screens a specialty, from No. 1 to 15 (fine).
Orders promptly attended to.
San Francisco Pioneer Screen Works.
221 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

EVERETTE'S MINING OFFICE.
Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHEOK, SAMPLES OF ORE, POLPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS,
Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.
Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.
DAILY, $6.00 a year; WEEKLY, $2.50, *in advance.*
H. S. SPAULDING, Publisher.
T. C. HOCKING, Editor.

WINCHESTER HOUSE,
44 Third Street, · San Francisco, Cal,

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.
Laundry Free for the use of Families.
HOT AND COLD BATHS FREE.
Terms, Board and Room, $1.00 per Day
And Upward.
Rooms with or without Board.
Free Coach to the House,

DEEP WELL PUMPS

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MF'G CO., 9 Nassau Street, Rockford, Illinois.

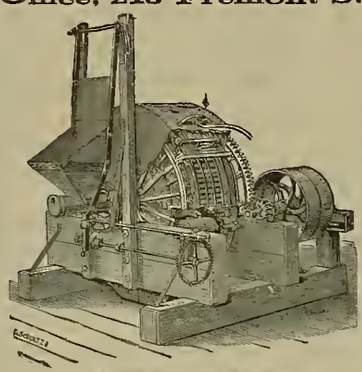
TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manilla Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.
Extra sizes and lengths made to order on short notice.
611 & 613 Front St., San Francisco, Cal.

PACIFIC ROLLING MILL CO.,
.....MANUFACTURERS OF.....
Cast Steel Castings and Steel Forgings
UP TO 20,000 LBS. WEIGHT.
True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.
GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.
—ALSO—
HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths **STEEL RAILS** from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridges and Roof Work a Specialty.
HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.
☞ Orders will have prompt attention. Send for Catalogues. Address
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,
HINCKLEY, SPIERS & HAYES, Proprietors.
[ESTABLISHED IN 1855.]
Office, 213 Fremont St., San Francisco.
—MANUFACTURERS OF—

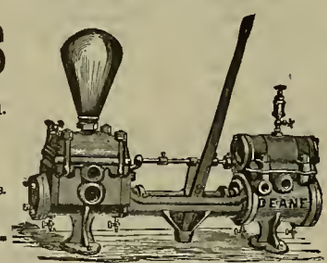


TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.
MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.
MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.
Boiler Repairs Promptly attended to and at very moderate rates.
AGENTS FOR THE PACIFIC COAST FOR THE
Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers. DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY
Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as
The Safest and Strongest High Explosives in the Market.
GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.
NOBEL'S EXPLOSIVE GELATINE, which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.
JUDSON POWDER IMPROVED.
FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.
BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.
Pacific Chemical Works.
HENRY G. HANKS,
Practical and Industrial Chemist, Assayer and Geologist,

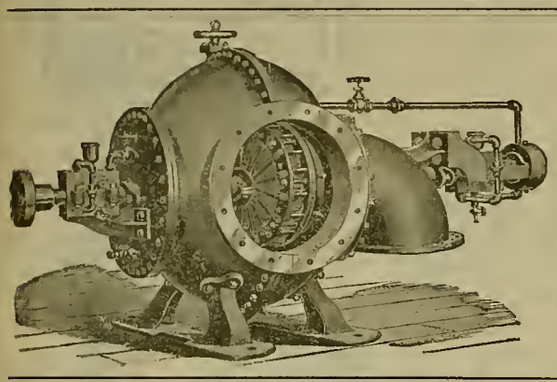
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S
Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York

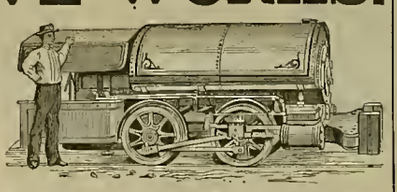
FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 800. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!



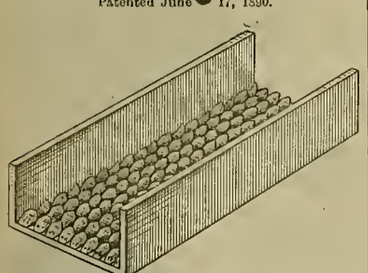
Adapted to every variety of service, and built accurately in standard gauges and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

BURNHAM, PARRY, WILLIAMS & CO., PROPRIETORS, PHILADELPHIA, PA.

TRAFTON'S
Gold Saving Device.

Patented June 17, 1890.



A NEW DEVICE TO BE USED ON TABLES FOR Gravel Mills and Undercurrents to Hydraulic Claims. When used in quartz mills it is equal to silvered plates. It is simple and economical in its construction and practical in its operation. Send for circulars. CHAS. TRAFTON, Yankee Jim's, Cal.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor us write again.

Market Reports.

Local Markets.

SAN FRANCISCO, Nov. 26, 1890.

General trade the past week was quiet—continued dry weather, tbe boliday season and tbe unsettled condition of affairs at tbe East being against the market. During tbe stringency at New York over $4,000,000 was transferred from tbis city to New York througb the Treasury. This is independent of large sums remitted tbe usual way. With an easy money market at the East, money is beginning now to set this way. Australia continues to send us large quantities of sovereigns for exchange purposes. The sovereigns are melted by the Mint and recoined as soon as received.

The demand for money is slow, but a more active inquiry is expected to obtain in next month for tax purposes and also for annual settlements, interest and dividends.

Eastern advices indicate that tbe stock panic is virtually over, and that large moneyed operators are preparing a program for a bull movement in tbe market.

MEXICAN DOLLARS—The market is dull at 81@82c. The coining of dollars by the Chinese Government and making them legal tenders will probably be against the shipping of Mexican dollars to that country.

SILVER—On last Wednesday, Nov. 19th, tbe price of silver fell in New York to 96¼ cents an ounce, hut reacted by small jumps up to $1.03, at which price it sold on Monday. Many English papers to hand stated tbat the success of the Democratic party in the United States was thought to be the forerunner to adverse legislation, and acting under tbis impression holders sold at declining prices. While the above opinion prevailed in England, in tbis country the success of the Democrats caused bimetallists to look with certainty upon a free coinage hill. The ignoring by the last Congress of farmers and labor unions' petitions asking for the free coinage of silver, undoubtedly led to the defeat of the dominant party; for the issue in the Central, Middle and Southern States was bi-metallism and lower tariff. There are many in position to know who affirm that the Republican majority may pass a free coinage of silver bill before the next session of Congress begins, so as to take the wind out of the Democratic sail. As a stroke of policy on their part it would be the very best. A press telegram reports that the Chancellor of tbe Exchequer will recommend the issuing hy the Bank of England of £1 notes based on silver. The bank can if disposed keep a portion of its reserve in silver. If it adopts the reported recommendation of Mr. Goschen, then a decided forward step has been made looking to bi-metallism. China is coining silver dollars, which will call for silver bullion.

QUICKSILVER—Receipts the past week aggregate as follows: Coast 160 flasks, overland 10. The exports aggregate 200 flasks to Mexico. The market is steady at unchanged quotations.

BORAX—Receipts the past week aggregate 418 ctls. The market is reported steady, with a good demand ruling at the East at full prices.

LIME—Receipts the past week aggregate 3760 bbls. The home demand continues steady, although, owing to the lateness of the season, buyers, it is said, confine tbeir purchases to immediate requirements.

LEAD—The market, which exhibited signs of lower prices, has gained slightly in strength. Large dealers do not look for much if any lower prices. Many believe tbat a higher range will rule after the turn of the year.

TIN—Imports the past week aggregate 433 ingots from Australia. The market for pig is still offisb, buyers not taking beyond immediate requirements. In plate, spot trading is slow; for delivery before the higher duties take effect there has been fair business. It is said that heavy purchases bave been made to arrive.

COPPER—The market is reported steady witb a strong tone. The strength to the market is due to the steady decreasing stocks under free consumption.

IRON—The market in all positions is quite firm. The strike in Scotland caused many furnaces to go out, resulting in a strong and bigher market. The advance abroad makes the Eastern market the lowest for shipments to this port. Imports the past week aggregate 105 tons of Oregon.

COKE—Imports the past week aggregate 414 tons from Newcastle, England. The market is firm at full prices for shipment, to arrive and on spot.

COAL--Imports tbe past week aggregate as follows: From Nanaimo, 4648 tons; Liverpool, 2900; total, 7548 tons. As there are quite a number of vessels on the way and to arrive from coast ports, receipts ought to show quite an increase from now on. The southern part of the State is being supplied by coal from localities in adjoining Territories. Wyoming coal is coming in more freely to points north and west of us. These deliveries cut off quite a demand on this port for coal, and in lessening the distribution points, import dealers here have a better opportunity of meeting the near-by demand. The financial troubles of the Oregon Improvement Co. will not affect the supply from their mines, as a receiver is in charge and work will continue as usual. Australian advices report that tbree vessels have sailed and that other vessels will receive quick dispatch.

NEW YORK, November 26.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	45½	99½	$16 50	$4 80	$20 60
Friday	46½	1 00¾	16 50	4 85	20 70
Saturday	46¾	1 02	16 50	4 85	20 70
Monday	47¼	1 03	16 50	4 80	20 90
Tuesday	47	1 02½	16 50	4 80	20 80
Wednesday	....	....	....	....	....

NEW YORK, November 25.—The unsettled condition of the money market is still an important factor in keeping the metal market in a more or less demoralized condition, causing correct quotations to be difficult to obtain. At the close a steadier feeling is setting in, which will probably assert itself after the present week.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

WANTED. A MAN WITH SOME KNOWLedge of practical and analytical chemistry wishes employment in a laboratory, metallurgical works, fertilizer factory, mine, or something of that character. Address B. C. H., 2133 Elm Street, Oakland.

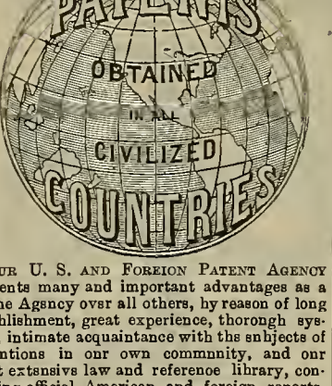
Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some responsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

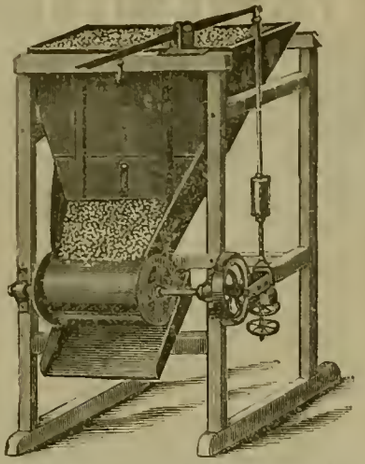
"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface, and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

SITUATION WANTED—MINING ENGINEER, eleven years' practical experience smelting and milling, six years as Manager and Superintendent, desires employment. Just returned from Central America. Highest testimonials and references. Speaks Spanish fluently. Address, ORINGO, Box A, this office.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]



This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

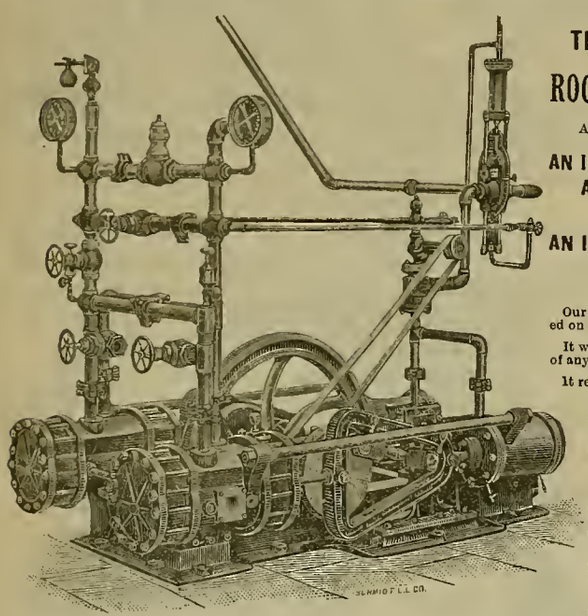
IMPORTANT TO MINING MEN AND R. R. CONTRACTORS.



The Cummings

ROCK DRILL CO.

Are manufacturers of

AN IMPROVED AIR COMPRESSOR

And also

AN IMPROVED ROCK DRILL.

Our Compressor is constructed on entirely new principles.

It weighs less than half that of any other of equal capacity.

It requires no Receiver.

There is no danger of overheating or freezing.

It is perfectly automatic in action.

Its first cost is less.

It saves in power required to run it from 25% to 50% over other systems.

It is especially adapted for running Pumps, Hoists, etc., etc.

For particulars as to price, etc., write to

THE CUMMINGS ROCK DRILL CO., 59-61 First St., San Francisco.

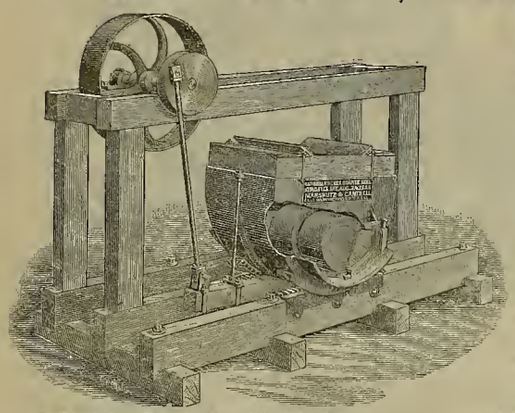
KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

☞Send for Circulars and Price List. MARSHUTZ & CANTRELL.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS,
PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one **is the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

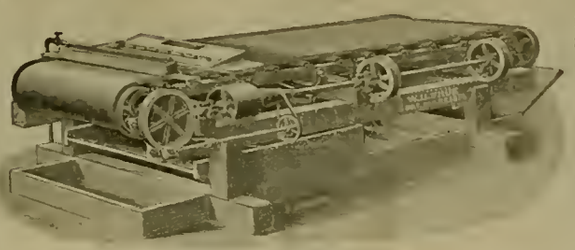
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Trimphe") can be mounted with a superior belt known as the "Blasdel" Riffled.

—o—

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

HINKLE'S GOLD ROLLER MILL

Will crush from 15 to 20 tons of hard ore per day and from 25 to 30 tons soft ore. Lubricated by water only. Guaranteed to crush with least wear of any mill in the market.

ENGINES AND BOILERS

Steam Pumps and Irrigating Pumps

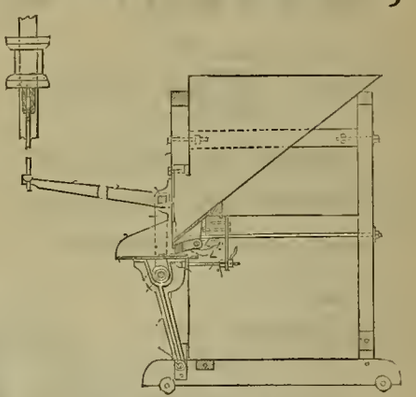
LAUNDRY MACHINERY,

Wood-Working Machinery, Iron-Working Tools,

LEATHER AND RUBBER BELTING.

—AND—

SUPPLIES OF ALL KINDS.

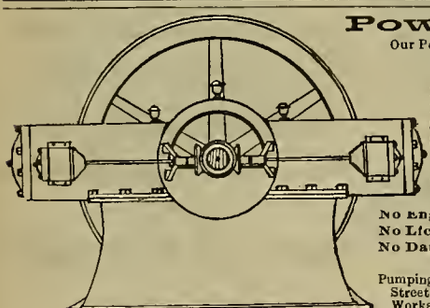


HINKLE'S ORE FEEDER

Will feed Wet or Dry Ore, for either Stamp or Roller Mills.

Power In or Out of the Shaft for Miners!

Our Perfected "Safety" Engines cost to run only 6 cents per working day and upward; they make their own vapor, and REVERSE instantly.

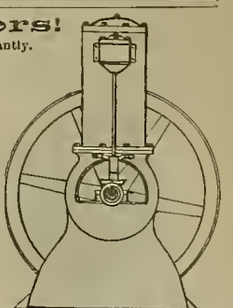


No Boiler, Fire, Smoke, Steam, Ashes, or Heat.

No Engineer, No License, No Danger.

Single, Double and Quadruple Acting.

½ H. P. to 100 H. P



Pumping Plants, Yachts & Launches, Street Cars, Fire Engines, Water Works, Etc.

ELECTRIC VAPOR ENGINE CO.,
218 California St., San Francisco.

Complete Plants of all kinds, Stationary or Mounted on Wheels. U. S. AND FOREIGN PATENTS.

The Drawing Process for Sheet Metals.

The cuts herewith given are designed to illustrate the manner in which vessels of tin, iron or other metal are produced from disks of sheet metal by the simple process of drawing by pressure, instead of making them with seams, as in former times.

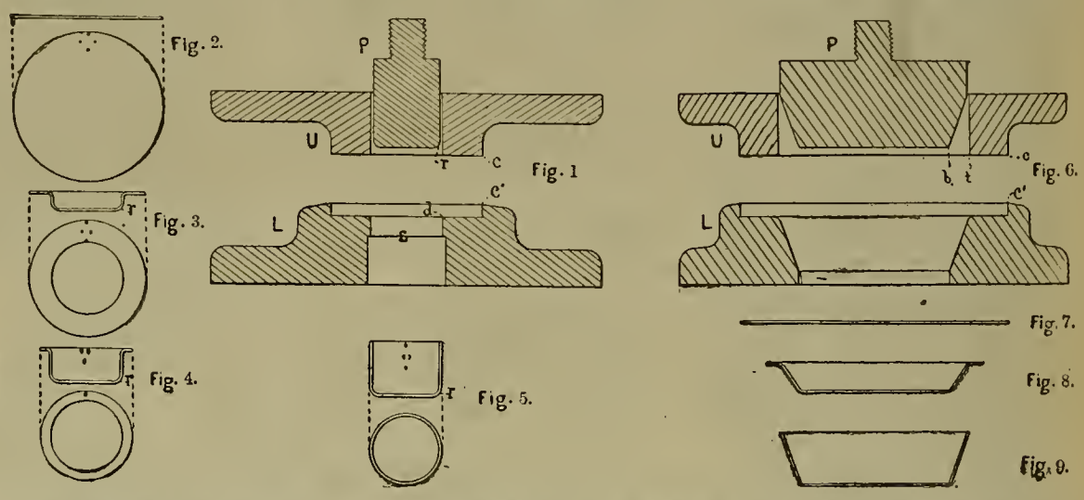
The operation consists in holding the disk so tightly between the two parallel flat annular surfaces of the dies that it cannot wrinkle while the punch which gives it its interior form is pushed down, through a hole in the upper die, into the recess in the lower die, which fits it with the proper amount of looseness to give space for the metal between. A set of these dies is shown in Fig. 1, in vertical section through their axis. In Fig. 2 is shown an axial section and a top view of the disk of metal, technically known as a "blank," before it is drawn. In Fig. 3 are shown the same views, respectively, at a later stage of the operation, when it has been drawn to about one-third of its final depth. At Fig. 4 it is shown at, say, two-thirds depth, and in Fig. 5 as completed.

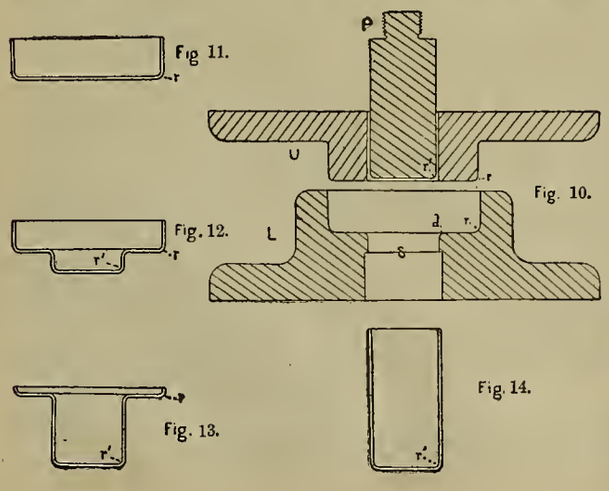
Four small dots will be noticed in Fig. 1, marked upon the blank, and forming the corners of a square, with its diagonal placed in a radial line. In the subsequent figures it will be noticed that two of these dots, upon either side of this imaginary radius, have gradually approached each other, while the other two dots, lying in the radial line, have receded, thus beautifully illustrating the respective directions in which the molecules of the metal have traveled in reaching their new locations.

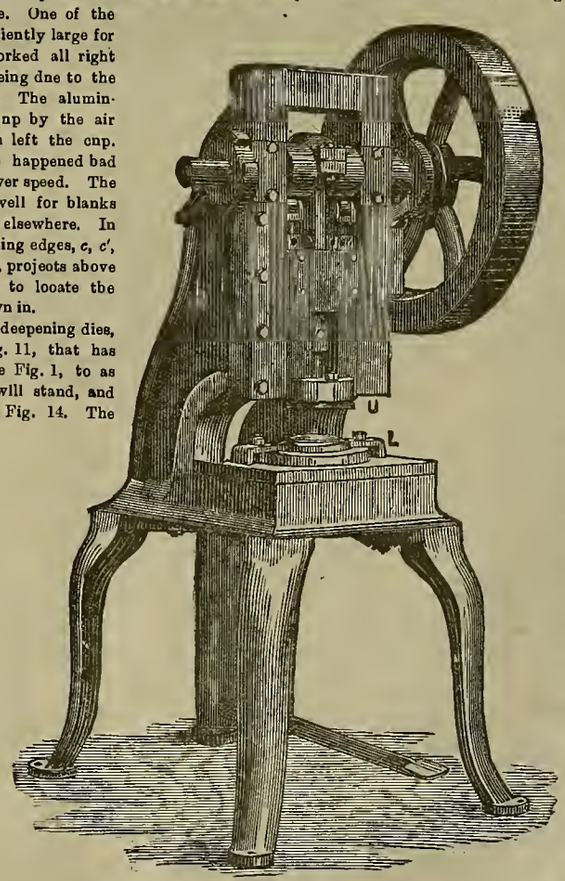
In Figs. 6, 7, 8 and 9 are shown a set of dies and the work in its several stages, of a form conical rather than cylindrical. The dies as shown in Figs. 1 and 6 are made so that they cut the disk from a large sheet of metal at the cutting edges c and c', as the upper die *U* descends to perform its mission of holding the blank from wrinkling between its lower flat surface and the corresponding flat surface of the lower die *L*. When *U* has descended until it is firmly in contact with the blank, it stops and remains rigidly in position until the punch *P* has descended and drawn the metal from between the two folding surfaces over the rounded corner *d* and down below *S* into its desired shape. The lower edge of the working part of the die *s* is called the "stripping edge," and is kept quite sharp so that the metal will not be pulled up again by the friction of the punch. Although it has just passed through the die, its elasticity expands it very slightly, so that this "stripping edge" is usually found sufficient to keep it down. That a blank not confined by a holding surface will wrinkle, is a fact easily proved by experiment.

In practice it is found necessary to put an ample vent-hole for air through the punch or else the cup is pulled up afterward by suction in spite of the stripping edge. One of the sample cups shown was insufficiently large for aluminum, although it had worked all right with tin plate, this difference being due to the stiffness of the latter material. The aluminum being softer, was pulled up by the air suction just before the punch left the cup. This, of course, would not have happened had the press been running at a slower speed. The dies shown will do equally well for blanks which have been previously cut elsewhere. In some cases, instead of the cutting edges, *c*, *c'*, a mere rim, with a round corner, projects above the surface, serving as a gauge to locate the blank centrally when it is thrown in.

In Fig. 10 is shown a pair of deepening dies, so called, which take a cup, Fig. 11, that has already been drawn in dies, like Fig. 1, to as great a depth as the metal will stand, and deepen it to the form shown in Fig. 14. The successive intermediate stages of the operation are shown in Figs. 12 and 13. These and subsequent similar processes are the ones used in cartridge-drawing, except that the metal is usually somewhat thicker than the space between the punch and the die, so that it is also subjected to stretching process similar to wire-drawing. This reducing in thickness is often called "broaching," but there is considerable confusion of terms used by various manufacturers.







GERMAN DRAWING-PRESS.

The presses used for all the dies just described are, of course, of special construction, being made with an "inner" and an "outer" ram. The latter carries the upper die and is arranged to stop for a time after a part of the stroke has been made, while the "inner" ram, carrying the punch, descends to the bottom of its stroke and rapidly returns, just as does the ram in an ordinary single-action press.

In Fig. 15 is shown a small drawing press for work of this kind, which explains itself. It is a picture of a German press and shows fairly well the principle involved. There are several kinds made in America, of better design, of which it might seem invidious to show one without the others.

A NEW ATTRACTION AT THE STATE MINING BUREAU.—Many visitors have during the past week been drawn to this institution to get a view of an exceedingly well-preserved Egyptian mummy now on exhibition there. This interesting relic from the land of the Pharaohs was loaned to the Bureau by John P. Young, Esq., to whom it was presented by the Hon. Jeremiah Lynch. The latter gentleman came in possession of it during his late sojourn in Egypt, having obtained it fresh from the tomb where it had rested undisturbed for more than 2000 years. As appears from the inscription on the outer casing, it is the body of a priestess in the Temple of Ammon-Ra, at Lycopolis, who died during the reign of the fourth Ptolemy, more than 200 years before Christ. Not only is the body of the priestess and the wooden case containing it well preserved, but colors in which the hieroglyphics and other emblems have been painted on the outside seem as bright and fresh as when first laid on, all of which may be accepted as evidence of the skill to which the Egyptians had attained in the art of embalming and the preservative effects of their climate. The public are under obligations to Mr. Young for placing these remains where they can be conveniently seen by all.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

French Gulch, Shasta County.

The Gladetone Mine and Mill.

EDITORS PRESS:—Having recently visited and mill hy the very efficient superintendent, the property of the Gladstone Co., located north of French Gulch, I was shown through the mine Capt. Clark, who has had much experience as a mining man hoth in thia country and in Sonora, Mexico.

This company, which has recently purchased here 11 mining claims, the Gladstone being one of the numher, has since proceeded to eqnip the same with a first-class plant, consiating of a 20-stamp mill with ahops, hoarding-honees, etc., especial cara having been taken to provide for the health, convenience and comfort of the workmen. The mill, which carries 20 stamps and is very complete in all its appointments, is now ahont finished and ready to start up.

It was at first intended that it ahould carry hnt ten stampa, hnt the improvement shown in the mine as developments progressed, determined the company to pnt in 20 stampa at the atart. It is to he rnn hy water-power, the water heing hrought in thrnugh a flome several thonaand feet in length, and delivered under a pressnre of 282 feet.

The mill, mine, and all the huildings connected therewith are to he lighted with electricity. The dynamo to he placed ln the mill will also he run hy water-power. The mine at present is heing worked throngh the Gladstone and Helena tunnels. The Gladstone, whioh is the only tnnnel of any great length yet run, is ahout 1000 feet in length. The Helena tnnnel, ahout 200 feet farther up the monntain, is in 200 feet, showing at the breast a hody of ore 14 feet wide and averaging $20 per ton. The Ohio tunnel, located on a lower level, is to he driven into the mountain aome 800 feet, where it will tap the ledge at a depth of nearly 500 feet. This will he the main working level. While this mine has heen called a low-grade one, some of the ore fonnd here is ao rich that it will he sacked and taken to the mill. Thare are at present ahout 100 men employed in and ahout the mine. The lumher nsed is hanled from Redding, and it will take several hnndred thonsand feet to finish the work.

It would he a good thing for investors if we had ln the conntry a few more mines like the Gladstone, and it would he a good thing for the workmen if we had a few more mining snperintendents like Capt. Clark to look after their comfort. B. F. B.

French Gulch, Shasta Co., Cal., Nov ,1890.

More About Tempering Drills.

EDITORS PRESS:—I do not know that any information I may impart as a practical hlacksmith will he of henefit to Mr. S. H. Bryant of Tombstone, Arizona; hnt this much I will say: Having had years of experienoe, I helieve that practioal resnlts are of more value to the practical mine-worker than any scientific knowledge "as to what may canse oracka in steel drills." I have worked dnring my lifetime thirty years at my profession, and at different periods have worked all hrands of steel used for mining pnrposes. When a hlacksmith sharpens three hundred drills and sometimes more, in a day, and the necessary amonnt of picks, gads, etc., if throngh hurry or carelessnees of his helper a drill is hurnt, the only way is to cut off the hnrnt portion.

My method of workiug cast steel drills ie as follows: I nse hot and cold water. Drills mnst he heated to an even heat to sharpen. I chill from the hammer, and as ls the case often, the drill is heated two and sometimes three inches ahove the point. I immerse my drill in the cold water, eo aa to exclnde the atmosphere from any portion that ls heated, for eight or niue aeconds, withdraw immediately, and drop lt into the hot water (the hotter the hetter) and let it cool there. My reason for so doing is thia: I do not helieve in anything hut a chill (hardened right out) for a rock drill; hy immersing the drill so as to exclnde the air, the shank portion is chllled only skin deep; hy putting it in the hot water the point retains its chlli as desired, while the shank from the heat in it comes down to its natnral order. Practical mining hlacksmlths will know my meaning. I venture to assert lf snch a method he adopted, few drills will break ahove the hit and cracks will he hnt seldom seen. I have sharpened Firth & Son's steel forty times without cracks of any kind, and our oommon American hrande twenty times and sometimes more.

Believe me to he a reader of the PRESS and a lover of the information it contains.

JNO. DUNCAN SMITH.

Navajo Mine, Tuscarora, Nov. 17, 1890.

PUBLIC FRENCH OPINION ON THE LENOTH OF A WORKING DAY.—Among the 19,455 anewers to the list of qnestions connernlng the regolation of the working hours and of work generally which have so far heen received hy the French Commission, 4442 are against any and all regolation, 5012 are in favor of a working day of eight hours, and 9270 advocate as the number of honrs to constitute a day's work 9, 10, 11 or 12; 731 answers are too vague to deserve notice.

As Others See Us.

Mr. E. Dickinson, Sheffield, England, who participated in the recent international meeting of engineers, stated, when interviewed on his return to England regarding his impressions from his journey, according to the *Iron and Coal Trade Review*, that the Americans consider that they are in every way in advance of the mother conntry, and, in fact, of all the countries in the world. "Their buildings and institntions are higger and hetter than anywhere else; their works and manufactories are on a very large scale, and the ontpnt, owing to improved organization, is considerahly more than would he seonred hy the same nnmher of men and the same amount of plant in England."

As an instance, the worke of Disston & Sons, at Tacony, where saws and files are manufactnred, turn ont an ontpnt in saws equal to the total outpnt in Sheffield. Their prodnots are all machine made.

Generally, machinery is more extensively nsed than in England. At Diaston's works, Mr. Dickineon was atrnck with the machines for cutting and at the same time gradnating the teeth of hand-saws. They were fed hy lads, and the hlades paesed through as quickly as it was possihle to handle them. The mahines cnt 1500 teeth per minnte. The same firm alao has a mnch more expeditions and improved method of "goffieg" and tempering than Sheffield firms have. The furnaces used for this pnrpose are heated hy gas and have a revolving center. He was very mnch interested in the manufactnre, at Disston's, of circular saws with renewahle and interchangeahle teeth, an invention he termed "caplta1." In the warehonse mentioned, he observed packages of saws addressed to England, and also saw some hand-saws there 40 feet ln length by 14 inohes wide.

"The American manufacturers go more in for quantlty and rapidlty of output than quality; hnt they do not care to pnt work and high finish on parts of machinery that are not seen."

"In general tools they have not anything like the same nnmber of patterns, consequently in slack times they can make immense stocks, and know exactly how long lt will take to dispose of them."

The American prodnots he did not find anperlor to the English, and in many cases decidedly inferior. "But the Americans are mnch more inventive than other nations, and their patents mnch more valuahle."

Mr. George Siddell, Sheffield, was greatly impressed by the ahundance of our resonroes, the rapidity of our indnstrial development, the enterprising spirit, industry and application of our people. Greatness, he thinks, is eqnally characteristic of the manufactnres here and of the physical resources of the continent. Everything he found to he on an extensive scale, except gnns and ships; and the fact that the Government has hought up the nickel mines he interpreted as siguificant of its intention of making armor-plates on a very different scale from anything as yet attempted. The American mannfactnrers never stint expenditure as to plant and machinery; and labor-saving appliances in the iron and steel works, and especially in the rail and plate mills, cnt manual labor down to a mere cipher. Therefore he helieved that hnt for the tariff the American mannfacturers wonld he ahle to compete with the English in any market.

As to the ontput of the American works, he admitted its greatnese, hut thought that in England the Consett Iron Company turns out ahout fonr times as mnch as the largest American worke. Whereas, Carnegie's output is ahont 4000 tons a month, the Consett Iron Company produces ahont the same quantity every week. Carnegie's place is magnificent. The arrangement of the melting furnaces, hoth there and at some of the otoer places, is splendid. There is nothing in England that comes np to it. Some of the melting furnaces have a capacity of 35 tons, and there are hardly any in England greater than 30 tons. They have many circular furnaces, too, which are not seen in England, hnt he did not know that there is any great advantage in that mode of construction. At Chicago they roll direct from the ingot, without reheating, which ls also done in some English works, hut Carnegie's method of rolling from the bloom he considers hy far the safer plan.

Asked as to the comparative capahilities of English and American worke, Mr. Siddell admitted the enperiority of the American rail-mills, hut as to large forgings they do nothiog heyond ten tons, "whereas the English worke can rnn np to any weight that there is a call for." He qualified, however, these statements hy remarking that he had not inepected the Bethlehem Works, where the Government orders are executed for gnn forgings and the like. "There is a splendid opportunity," Mr. Siddell added, "for energetio Englishmen to go ont there in the heavy trade. They might make a fortnne in a very short time, hecanse there is no heavy work done there yet. They are jnst oommenciog with the gnns, and any one well np in gnn forging could command his own price."

Both gentlemen were fnli of admiration for the American workingmen as steadier, more intelligent and quicker than the English operatives. They work harder and longer honrs. Mr. Dickinson's helief that the Amerioan workman who receivee £3 a week is not hotter off than the Englishman who only gets £2, owing to the smaller purchasing power of money in America, is hardly compatihle with his nttterance that the American workingmen "strnck him as heing well dressed and having very comfortahle homes; and a higher social tone prevails among the artisans there than in many of onr indnstrial centers."

That America is far ahead of Europe in the numher and variety and efficiency of electrical applianoes, was acknowledged as an undiepnted fact.

Mr. Dickinson ventnred the opinion that English firms transferred to Amerlcan soil might he highly snccessful if they had enough enterprise and energy. Another statement of Mr. Dickinson to the effect that "Americans admit that in cutlery they cannot approach the English for quality; that the well-to-do Americans lnvariably have Englieh cutlery for their own nse; and that you cannot pay an American a greater compliment than to give him a really good Sheffield knife," needs no comment to he appreciated.—*Engineering and Mining Journal.*

Gold Mining in South Africa.

A report issned hy the Witwatersrand Chamher of Mines gives a fair idea of the actual condition of affairs exiating in that portion of Sonth Africa, at least it gives a fair idea to those who have watched the hoom, growth, development, decline, revival and final adjostment of affairs npon a hnsiness hasis of profit and loss. The history of mining regions is hnt a repetition of one story.

The report states that the value of the groes production last year was, in ronnd nnmhers, $6,950,000. The mining industry of Johannesbnrg is the only value-prodncing industry there, so it must have paid for all expenditnres there which the ontside world did not pay for.

The expenditures are placed at $9,000,000 paid for freight on snpplies, while the valne of the supplies is not given. Taxation and royalties on mines amounted to $4,410,975, and wages to $1,160,000. How much of the wages, royalties and taxes entered into the freight or transportation acconnt cannot he told. Possihly all of it did. Leaving ont these items, as well as the cost price of all snpplies, and considering only the freights paid, we find that $6,950,000 of gold cost $9,800,000. The condition of affairs there is much like what it was in the Rocky Mountain region when all supplies were hanled from the Missouri river, and when the freight rates were from 5 to 25 cents a ponnd and the freights alone exceeded threefold the value of all the gold prodnced in the mountains. There are, too, other features common to Africa now and this region when it waa very new, 25 years ago. Dance-honses, hurdy-gnrdys, gambling, and all their accompanying lawlessnees characteristic of new mining regions, have heen holding high carnival at Witwatersrand, as they once did here.

But what can he thought of mining in a region where, out of a total production of $6,050,000, the sum of $4,410,975, or over 60 cents on a dollar, mnst he paid to the Government as taxes and royalties?

Death Rate in Different Industries in England.

According to an Eoglish exchange, the annual death rate per 1000 employed is as follows:

	Age 25 to 45 yrs.	Age 45 to 65 y'rs.
Average for the whole country	10.16	25.27
Minimum	4.64	16.93
Maximum	22 63	55.30
Coal miners	7.63	25.11
Iron ore miners	8.05	21.35
Tin miners (Cornwall)	14.77	52.69
Cutlery makers	11.70	34.42
Boiler-makers	9.27	26.65
In iron and steel works	8.36	22.35
Average for metal-workers	8.80	25.03

It appears, therefore, that coal mining, instead of heing an "extra hazardons" occnpation, is in reality one of the safest.

RESPONSIBILITY OF EMPLOYER FOR SAFE APPLIANCES.—A mining company which employs a superintendent to hire and discharge the men and fnrnish them with snpplies is responsihle for his negligence, and notice to him is notice to the company. Where a company nndertakes to supply its miners with fuee, it is charged with the dnty of fnrnishing good fnse, and where notice is given to the enperintendent that fnse supplied to a miner ie had, and he tells him to do the hest he can with what he has nntil more can be seoured, the company ls responsihle in damages for injnries sustained hy the miner if he ie injured while using the defective fuse with the degree of care which its condition wonld impose upon a prudent man.

THE FIRST SIAMESE RAILWAY.—In our Indian mail we find that a German company has got the contract for the first Siamese railway. The line will he 165 miles long from Bangkok to Korah. German rails and machinery will he nsed, and German engineers will he mostly appointed. Mr. Bathze, in charge of the work, promises to lay the line down for one million sterling.

A BERLIN statistician reports that the nnmher of suicides in the varions countries of Europe, including England, was 85 per cent greater hetween 1880 and 1890 than dnring the preceding decade.

[COPYRIGHT, 1890, by Dewey & Co.]

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XXII.

[Written for the PRESS by JAMES H. CROSSMAN.]

Mineral Belts.

It is a well-nnderstood and acknowledged fact that metalliferous veins in all important mineral-hearing conntries occnr in belts or zones of considerahle longitndinal extent and of variahle widths. These helts are nsually fonnd in triplets, and as a rnle lie parallel with each other. Situated within their exterior honndaries and adjoining one of the contacts, a so-callad mother vein—it being of mammoth proportions—occurs. The gangue is either silicoons or calcareous or a oombination of hoth minerals—lt being invariahly metalliferons. From this main lode radiate hranches, spure, feeders and stringers that draw their metalliferous contents from the helt proper. To nse a simile, the helt is the metalliferons water-shed that supplies the tributaries which flow into the main artery. The formation compares to a tree—the mother lode being the trnnk and the spnra and feeders the hranches.

Notahle instances of this law of nature are fonnd in the Veta Madre of Mexico with its parallel metalliferons helts—the so called mother lode of California with its three or more parallel helts comprising the copper-hearing zone on the west. The first east consists of the helt that forme the metalliferous domain of West Point, in Calaveras county, traceahle northerly and southerly for a long distance. The next east and paraliel we find the helt in which the Sierra Buttes, Plumaa-Eureka and other prominent mines are situated. The Comstock of Nevada is traceahle for a long distance with the two or more parallel mineral helts or zones.

San Bernardino oonnty is no exception to this rnle. She haa within her houndary lines at least three important mineral helts whioh we will describe later. It is this fact that enahles the mining prospector to snccessfully prosecute his work of discovery. Regardless of formation or debris-oovered valleys, his compass his gnide, he takes his hearings and starts for an objective point, and he seldom misses finding, in the first monntain peak that rises ahove the level of tha plains, metallic float, either in the ravine or on the sidehills of the range. He traces the float to its sonrce. If the lode does not crop, he sinks his shaft and finds it.

In Artiole 21 of this series it is stated that the next numher wonld contain a description of Calico and its mines; hut after a recent and more careful examination I have decided that the complex nature of the mineral-hearing zone in which the prominent mines of that locality occur, requires a more thorough investigation and careful study before entering npon its description. The vein ocorrrence, however, in the violnity of Calico has heen governed hy the same general laws—Calico heing no exception to the rnle; hnt as volcanic action and its reanltant effects have been more violent and decided at this point than at any other in San Bernardino connty, the phenomena reqnire an especially carefnl examination. I will therefore for the present continne my general description of the helt in which the metolliferons veins of Calico monntain occur.

The helt proper has a longitndinal extent of at least 140 miles. Its strike is north 65 east and sonth 65 west. It is of variahle widtb, expanding and contracting. At its narroweet point it is one mile wide and at its greatest expansion eight miles wide—disappearing where covered hy soil and debris of the valley lands, hut invariahly appearing in all elevated peake and monntain ranges on its line of strike. Its mineralogical featnres are strongly marked and easily recognized from the surrounding strata hy the metamorphio condition of lts rocky structnre, as well as hy discoloration caused by metallic oxides that stain the snrface of the mineral-hearing veins which occnr on the helt. The Iron Hat, so well known to the mining prospector, is a snre indication that it is only the cap of a metalliferous vein containing either lead or silver. A hlne-green or red stain indicates copper—its carhonates and oxides appearing on the snrface.

During the periods of voloanic activity that at no remote period, geologically speaking, convnlsed the whole western portion of the American continent from pole to pole, powerful gaees and thermal waters, snrcharged with hoth mineral and metallic substances, have fonnd vent at the earth's crust, throngh either previonsly or contemporaneonsly formed fissures—their sonroea reating in deep-seated centers. These volatile gases and squeous products, on meeting wlth reagents in their upward passage, deposited hy precipitation their hurden—the latter silica and lime in the form of a paste which rapidly orystallized, filling the fissnre vents with qnartz and spar of their several varieties of silicoons and calcareous compounds. Thie formed the gangne of the vein, which in turn was impregnated with metallic compounds hy the same common carriers, gas and steam, augmented at a later date hy electrioal aotion concentrating and depositing the precious and haser metals from the enrrounding rooks hoth in and on the vein plate of Natnre's electric hattery. This process is in oonstant and never-oeasing operation.

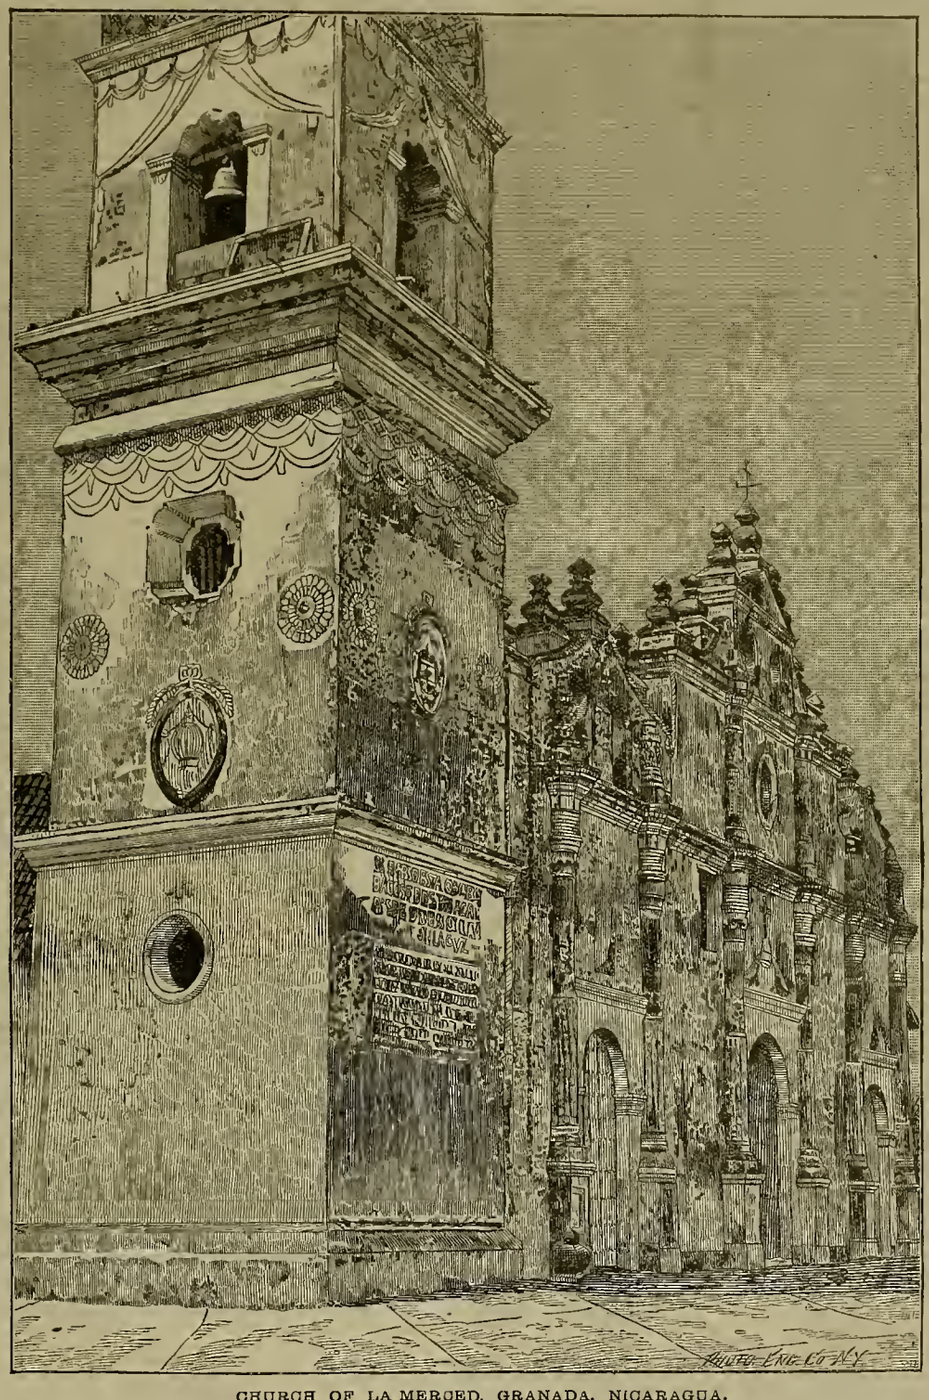
In onr description of this important mineral helt we will commence at its southwesterly extremity, where the low hills and monntain

ranges emerge from the Mojave desert. At this point its mineral character is first noticed. It shows a width of six miles, by a longitudinal extent of 12 miles—in several places covered by the debris of the valley lands, but plainly marked and distinguishable at all elevated points. It is here that we find the several mining camps of West, Central, North and Galena—each situated on elevated points above the plains (for particulars, see Article 17 of this series); thence northwesterly, following the course of the belt over a debris-covered plain for a distance of 24 miles, we enter the boundaries of the Grapevine Mining District, which contains the southwesterly extremity of the Calico mountain range. At this point, we having entered the confines of the Plutonic realms, evidences of volcanic activity are seen on every side. To the unpracticed eye of the casual observer, the rocky structure has been plicated, crumpled, faulted and thrown into every conceivable shape and to all appearance into inextricable confusion; but to the practiced eye of the observer and geological student who has graduated in the field, order from chaos can be restored. Both the exterior walls of the belt are in place and discernible. The underlying or footwall still carries the mother lode; the northerly wall is intact. The intervening space, though much disturbed and with long lines of volcanic debris and ash, shows marked and well-defined veins of spar and quartz rich in the precious metals, which will be particularly described under their appropriate head. This portion of the belt from the Central to the Emma, Waterman and Calico mines is traceable and continuous on its line of strike for a distance of more than 18 miles, with the exception of about 3½ miles of intervening debris-filled valley lands (see Article 5); thence on our course for 12 miles over a desert country, we reach the southwesterly flanks of the Alvord range (for description see Article 19). This mountain has a longitudinal extent of 15 miles. Thence, crossing a desert of 20 miles, we reach the range that contains the Solo Mining District, northerly from Soda lake (see Article 19 for description of this district and its mines). At this point the belt has a width of six and a length of three miles; thence, over a desert country for 24 miles, a low range appears above the plain which contains a group of silver and lead bearing mines known as the Bell discovery. The ores are of low grade but abundant, with no development of importance. The formation is similar in every respect to the Calico range and continuous for a distance of three miles, thence crossing a desert to the westerly flank of Clark Mountain and Mining District, of which the town of Ivanpah forms the distributing point for the surrounding country. This range is nine miles long. Its formation is largely calcareous, containing powerful dykes of porphyry and trap. The veins form in groups each independent of the other, and as a whole are comprised within the boundary line of the

Clark Mining District,

Which covers an area of about 600 square miles. This district is situated in the northeastern portion of San Bernardino county, the oldest organized mining district in the county, and in which the first silver bullion was produced. A frontiersman and well-known prospector by the name of Johnny Moss was the discoverer in 1868, through the assistance of a Piute chief, who brought him a piece of metallic copper which he had found in the vicinity. Johnny investigated and discovered its source, took samples, went to San Francisco and organized a company to develop the mine. The writer accompanied the outfit as mining expert for the company to determine its value. The party outfitted from Visalia. A Mr. Clark, one of the company, accompanied the expedition. At that time the Indian tribes of the desert were hostile, killing travelers and committing depredations in every direction; but Johnny was equal to the emergency. He formed a treaty of peace with the Piute tribe and was permitted to travel over their territory unmolested, drink water from their springs, kill their rabbits and mountain sheep, and work their mines. This treaty was kept in good faith by these nomads of the desert until news was brought by one of Moss's Indians that three German prospectors had been killed in the Arawatz mountains. Johnny, who had been previously elected as an honorary chief of the tribe, sent out his runners and built signal fires on prominent peaks, calling the Indians together for a powwow. The tribe assembled. A "big eat" was first in order; after that the traditional pipe of peace was smoked, and Johnny addressed them in the language of their tribe, asking them why they had broken their pledges by killing the prospectors. A consultation was held by the chief and medicine-man of the tribe, and they denied the allegation, claiming that Dutchmen were not white men and that they had not broken their treaty. After that, the Teutonic race was included in the treaty and peace reigned in the desert. On Moss's adoption by the tribe he was given the name of Narraguinip (never die). He died all the same, but the Indians still claim that he has crossed the big waters on a visit and will soon return.

(To be Continued.)



CHURCH OF LA MERCED, GRANADA, NICARAGUA.

An Old Church at Granada.

We illustrate on this page a very interesting structure of great age, the cathedral at Granada, a city of Nicaragua, a country which will come into growing importance in the world's eye as the Nicaragua inter-oceanic canal progresses nearer to realization.

Granada is a city lying on the western shore of Lake Nicaragua. The towns near the lake, of which Granada and Rivas are the chief, might under happier auspices have become great centers of population; but years of anarchy and internecine strife, together with the jealousy of rival cities—Leon and Managua for example—have produced more of ruin than time itself. Many a follower of Walker could tell stirring tales illustrated by the battered walls, wrecked churches and "places stormed at with shot and shell" in Granada and Rivas. There has always been a certain jealousy between the Nicaraguan cities as to the right to be considered the capital of the State. Even to-day it is not a safe issue for a stranger to raise. In the total population of 400,000 the ancient and aristocratic city of Leon comes first with 30,000 inhabitants. Massaya comes next with 14,000, of whom, however, a large number are Indians. Then there is Granada with 12,000, and Managua, the generally reputed capital, with 10,000. Rivas, the ancient capital, has dwindled down to fifth place with 8000, but as the proposed canal will pass quite close to it, the prospects for its restoration to supremacy are exceedingly good.

Nicaragua is essentially a land of antiquities. The splendid churches and cathedrals built by the Spaniards have architectural charms and ruined glories of their own. The great cathedral of San Pedro of Leon is probably the finest religious edifice south of the City of Mexico. It was finished in 1743, at a cost of $5,000,000, occupying 37 years in construction. It is of cut stone and is one firm mass of masonry, covers an entire square, and its front extends across one side of the Grand Plaza. Like similar buildings whose ruined arches and walls may be seen in Antigua de Guatemala, this church has walls at least 15 feet in thickness, and has the solidity of a rock. Numerous earthquakes have produced no impression, and the storms of a century and a half have in no way injured its fine quality of stone. In numerous disputes between Leon and Granada, the church had often been converted into a fortress, and sustained a few bombardments from besieging forces. Thirty pieces of artillery are said to have been planted on its roof at one time and on its eastern side there are many indentations made by shot. This cathedral was once possessed of great wealth, the chancel was surrounded with a railing of solid silver, while all the altar ornaments were of gold. With the exception of the cup and plate used at mass, the church has no ornaments of precious metals now. Much was shipped to Spain, and what remained did not escape the rapacity of the soldiers, who have many times advanced and retreated through Leon.

The church shown in the engraving on this page is quite different in some respects from that at Leon to which reference has been made. It is the church of La Merced. It is ancient, massive, and in a good state of preservation considering the vicissitudes through which it has passed.

BLACK HAWK MINING COMPANY.—This company, composed of English capitalists, operating in the San Bernardino mountains, 40 miles east of Victor, has suspended operations, it is said, on account of low-grade rock. This company has expended a large sum of money in a hydraulic placer-mining scheme at Holcomb Valley. It seemed to possess abundance of means and no little amount of enterprise. In addition to the above work, it has bonded numerous prospects and purchased a number of tracts of land. At present it is engaged in developing its hydraulic mines on Lynx creek, near Prescott, A. T. At this point it is building an expensive flume ditch and dam. It is proposed to utilize the water after it has passed beyond the mining works in irrigating a large tract of land in Lonesome valley, recently acquired by Mr. Peddley, the superintendent of the company.

THE GERMAN GOVERNMENT AND THE MINERS. It is officially announced that all, or nearly all, the demands which were recently submitted to the German Government by the miners' delegates have been conceded. The principal points are that shifts last eight hours only, that all the miners who were dismissed after the recent strikes shall be reinstated, and that provision shall be made in the Labor Amendment bill, now before the Reichstag, for the creation of arbitration courts. The mining officials are also to come under the jurisdiction of the court of discipline, and they are to be punished for ill-treating miners. "Farming" certain jobs is also to be abolished.

THE copper mines at Vershire, in the eastern part of Vermont, have been pumped dry and large gangs of miners are working in them night and day. To light the mines and the smelter, an electric-light plant has been put in. The houses have been repaired and painted, and are now filled with workingmen and their families. The opening of the mines has made a good market for the farmers, and the abandoned farms will be wanted. The mines formerly employed 300 men.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

FROM SUTTER CREEK.—*Ledger*, Nov. 29: At the North Star, about 60 feet from the shaft east, the ground began to change softer and a little water was discovered, and soon after quartz was struck. They have now a stratum of ground with stringers of quartz, which will altogether aggregate in the neighborhood of a foot, and under the assay process it has yielded $700 per ton. It may be a pocket, however, as it was at the 600-foot level, which lasted but a very short time. Another week and they can form a better opinion as to its permanency. Cheering news has also come in from the Rose mine. In drifting east they have encountered a body of ore apparently of considerable extent, which prospects well. They have not cut through it yet, and cannot tell what the thickness of the ledge is. Almost everything about the Wildman mine is finished and works like a charm. A painter is now at work putting the finishing touches on, which will take about two weeks. Taking everything into consideration, this is one of the best equipped mines in the county. The Lincoln is running along steadily with her 20 stamps. The ore being crushed is said to be of very good quality, and there is enough in sight to run them for some time to come. Exploring about the Sutter mine is going on satisfactorily and prospects are encouraging.

PLYMOUTH.—In the Plymouth Con. mine the drift running south from No. 2 crosscut has a small vein of rich rock. It is only ten inches wide. If this would only widen out to five or six feet we would have something grand. They are pushing it as fast as possible.

ON THE MOTHER LODE.—The Keystone has lately reduced its force of miners. Twelve were discharged last week, reducing the underground employes to about 50. At the Casco or Hardenburg claim at Middle they have at last got to the bottom of the shaft after encountering unusual difficulties. They are now cleaning out the drifts, which is also a tedious and disagreeable undertaking. Arrangements are being made to crush 1000 tons of quartz from the Clinton Peak claim at the McKenzie mill. The rock will be taken from the large ledge near the mouth of the tunnel. The Amador gold mine will, according to recent advices from London, be soon in a position to start up work again. The principal American owner is expected here shortly to make the necessary arrangements for his associates to put up their pro rata of the sum required to place the company on a solid financial basis. The money due from the London investors has all been raised and can be paid at any moment when the balance is forthcoming. Mr. Minear, who formerly managed the mine, is now running another concern down in the Julian district, near the Waterman property.

Calaveras.

PROGRESS MADE. — *Chronicle*, Nov. 29: F. J. Horswill has commenced work opening up the Pellaton gravel mine near the Junction. We understand that Mr. Tuttle of the Tuttle mine in Chili gulch is negotiating for a 10-stamp mill.

AT ANGELS' CAMP.—*Mountain Echo*, Nov. 27: The future of Angels never looked more promising. It is now a well-established fact that the mines here are situated on what is known as the mother lode, and as to their permanency there is not a doubt. All the mines now in operation in and near this town are running full-handed and yielding good returns. There is no doubting the fact, Angels mining district is the best mining section in the State to-day, and a few years hence the mines of this town alone will rival if not surpass any in richness ever worked on the Pacific Coast.

El Dorado.

SHOWS UP WELL.—Georgetown *Gazette*, Nov. 27: Machinery and material continue to arrive for the Van mine. Supt. P. P. Tischer is maturing the work as fast as possible, and with a continuance of this favorable weather will get the mill and hoisting works ready for business before another week. C. S. Hersey is the millwright. A few hundred tons of ore is already on the dump, and it shows up exceedingly well by pan tests. We rather think this mine will cause some of the Silurians to crawl into their holes and double up before spring.

THE CALIFORNIA WATER CO. has had a force at work during the past two weeks building a dam on Rock canyon, below Noble's mill, for the purpose of raising the water to obtain sufficient grade for their ditch.

Fresno.

COAL.—*Republican*, Nov. 27: The San Joaquin Valley Coal Mining Co. are pushing developments on their coal deposit in the Coast Range. These deposits are at the edge of the foothills, 3½ miles from Coalingo, a station on the branch road to Gosben. The company has built a branch line from Coalingo to the mines, which they operate, having an engine of their own. They have 40 men at work and the output is about 50 tons a day. The coal is a bituminous lignite. While it is not a first-class domestic coal it gives excellent satisfaction for steam purposes. A test made at Los Angeles upon the invitation of the Los Angeles Cable Car Co., proved it superior steam coal, heating the Gallup coal of New Mexico.

Inyo.

OFF FOR DEATH VALLEY.—*Independent*, Nov. 27: John Alexander left town yesterday for Death Valley, his only company being five donkeys packed with a camping outfit. He intends prospecting in the valley and surrounding mountains for several weeks. Mr. Alexander knows the country well and feels quite safe in going there alone.

LEE DISTRICT.—Last Tuesday George Lewis and White Smith left town for Lee Mining district. There is a large quantity of low-grade ore in the district; it carries about 45 per cent lead and 15 to 20 ounces silver per ton. At the present price of lead it is believed that the ore can be delivered at San Francisco and leave a good profit to the miners. It is estimated to be worth between $60 and $70 per ton at the mine. The ledges are big, the ore easily mined, and if it will pay at all a large number of men can be employed. It is to determine this point that the trip is made to the district.

WILD ROSE DISTRICT.—*Independent*, Nov. 28: Wild Rose district is one of the most promising but least known mining districts in the county. The main hindrance to better prospecting there is the want of a road to reach it. Gunn and Fitzgerald contemplate building a road that will give access to the district by wagon teams and be 21 miles shorter than any road now existing between there and Darwin. It is known that there are many fine-looking ledges of ore in the district and all the indications for valuable mines. The opening of the proposed road would surely lead to a great deal of prospecting in the district.

FROM THE MARBLE QUARRY.—Two carloads of marble were sent north yesterday morning. The stone is for the Mills building, San Francisco. Very handsome slabs of marble are being taken out now for the building, some of them being 18 feet in length and of proportionate width. These will be cut and polished at the mill on Truckee river.

Los Angeles.

MINES IN SAN GABRIEL CANYON.—Pomona *Times-Courier*, Nov. 29: Cullen & Miller of Glendora are pushing the work on their silver mine in the San Gabriel canyon. The First National Bank of Los Angeles has on exhibition a brick of $1300, which was milled from 3¾ tons of ore from their mine. D. P. Lewis of the canyon exhibited recently in this city some fine specimens of ore from eight mines which he owns near the Cullen & Miller mine, and all these splendid indications seem to point to a prosperous mining future for that section. Mr. Lewis is down 100 feet in one of his mines, and the ore, which exists in an immense body, goes $11 per ton.

Modoc.

ASSAYS WELL.—*New Era*, Nov. 22: Newt Jacobs was exhibiting a specimen of rock here the first of the week from a ledge recently discovered on Soldier creek, Surprise valley. He claimed that it assayed $64 to the ton in gold, but it was about as worthless looking rock as we have seen, although the ledge may be rich.

Nevada.

PEABODY MINE.—*Tidings*, Nov. 29: The recent strike at the Peabody mine continues full of promise. The strike was made at a point 250 feet in a drift, at a depth of 250 feet on the incline. The ledge is a foot wide and will yield $75 per load right along, while specimens may be found at any time. In the drifts above, the same shoot has been worked and paid very remuneratively, facts which tend to confirm the belief that it is a permanent vein.

VARIOUS ITEMS.—At the H. & H. drift mine at Randolph Flat, considerable water is coming in from the gravel channel cut last week. The outlook is considered quite favorable. The milling facilities on the California mine, in Eureka townsbip, are to be improved. The California is owned by Pat Foley, and is valuable property.

THE SEVEN-THIRTY BONANZA.—*Union*, Nov. 29: Another lot of gold-bearing specimen rock was brought in to the Citizens' Bank yesterday from the Seven-Thirty. The specimens, which were the largest and richest of any yet taken out of the mine, attracted enthusiastic attention. Old miners looked at them with admiration, and declared they were handsomer than 20-dollar pieces. One piece, about six inches in length, was estimated to contain $350. It contained more gold than quartz. The owners of the mine advertised a few days ago to sell 30,000 shares of the stock to raise a working capital, but they have now withdrawn the offer, as the mine is turning out so well that they do not feel it necessary to sell any stock.

MANHATTAN MINE.—Some fine-looking ore has been taken out of the north drift of the 300 level of the Manhattan this week. The ore shows well in galena and in fine gold, and the general characteristics of the quartz is like the best ores of the Nevada district. The vein shows a width of about 18 inches of good milling ore.

RICH SPECIMENS.—*Tidings*, Nov. 28: More rich specimens of gold-bearing quartz were brought to the Citizens' Bank from the Seven-Thirty mine on Saturday. These specimens were found in hard blasting ground, which is encouragement that more of the like kind will soon be forthcoming.

NORTH BANNER MINE.—The mill of the North Banner mine is kept going continuously on good milling ore. The main shaft is now down nearly 400 feet below the drain tunnel level, and is in a fine body of ore.

BEING OVERHAULED.—*Herald*, Nov. 26: The mill at the Nevada City mine is being overhauled and put in good working order. With the tributers and day's pay men there is now quite a force at work at the mine. The company are conducting operations at the new shaft and are meeting with favorable prospects, while the tributers, working at other points on the ledge, are getting out good rock. As soon as the mill is in shape again, crushing will commence.

Plumas.

PLUMAS WATER & MINING CO.—*National*, Nov. 22: The main source of water supply of this company is Silver Lake, situated at the base of Spanish Peak, a natural basin formed by glacier or volcanic action at some remote period, which is fed by snow and springs from the above peak. By building a dam 15 feet high a body of water was formed one and a quarter miles in length by three-quarters of a mile in width, the deepest part in the center of the lake being 114 feet. From this lake the water is conveyed by a ditch with a capacity of 1200 miners' inches to the Mountain House. It is then dropped a distance of one mile and collected in a settling dam, and then conveyed by a ditch to Bear Hill, Gopher Hill, Badger Hill and Shore's Hill. The ditch supplying these points has a capacity for 2000 inches of water. On the line of the system some fluming was necessary, but the main work was in building ditches. As far back as 1871, this company owned the most valuable gravel locations and water privileges combined to be found in the county. This property consisted of 1500 acres on and under their ditch system, including Gopher Hill and a main ditch from Gold and Silver lakes on Spanish Peak, the main ditch being 20 miles in length and five miles of branch ditches. From the Gopher Hill property alone, over $300,000 was extracted by the hydraulic system, but since the unjust decision of the courts regarding this profitable way of mining, the water supply and mining interests have been idle for years, with the exception of a small head of water sold to miners in the district for ground-sluicing, etc. The affairs of the company, which is incorporated, are looked after by Messrs. Thompson & Kellogg, who are stockholders and local managers, and who keep the property in good repair, pending the report of the commission, appointed by the Government to report and devise some measure to permit the working of valuable gravel deposits in this county, and thus place this company, who have expended upward of $100,000 in their water system and mines, to again reimburse themselves for this large outlay of capital now lying comparatively idle.

San Diego.

STRIKE ON THE BLUE HILL.—Julian *Sentinel*, Nov. 26: Gov. Waterman last week cut another good ledge in the 1000-foot tunnel on the Blue Hill. This time it is a four-foot ledge and said to be good milling rock. Before the tunnel is completed we predict that the Governor will have enough in sight to warrant him in putting up machinery equal to that at Stonewall.

GOLD KING AND QUEEN MINES.—Hoisting machinery has been put up on the Queen mine. The hoisting on the King is being done with a whim, but a steam-hoist will be put up here also as soon as the machinery can be hauled on the ground. These mines are only about 100 yards apart. The main shaft of the King is down a depth of 80 feet and levels have already been run about 100 feet on the vein of ore. The shaft of the Queen is down 130 feet and some 300 feet of levels have been run. As yet no stoping has been done in either mine, but from the work already done some 250 tons of very fine ore now lies on the dump awaiting the completion of the new mill. A large barn is to be built as soon as lumber can be had, to accommodate the large number of teams that will be required around the mine. Some 200 cords of wood are stacked up in the yard and more coming every day. At present this company has on the pay-roll at the mine, 25 men, and this number will be increased shortly. The men are well provided with good bunks in the new bunk-house and a boarding-house is right at hand. The Coronado Foundry & Machine Co. have the contract for the erection of the new mill now going up on the company's mill-site in Banner. The mill will have ten 850-pound stamps, two Challenge feeders, a 40-horse-power engine, and a 45-horse-power boiler, and will crush 25 tons of ore per day. The boiler and engine were made in Indianapolis. The balance of the machinery is of home manufacture, made at Coronado. The building that is to cover the mill will be 28x70 feet and will contain 40,000 feet of lumber, the lumber coming from Minear's new sawmill on the Volcan. The lumber is sawed and is being delivered as fast as teams can haul it. An assay office is going up which will be 14x24 feet. The brick for the furnace are on the ground and are of home manufacture, having been made at Cuyamaca, except the firebrick for lining, which are imported. The battery timbers are of Oregon pine and are solid pieces 12x24 inches and 24 feet long. There are 16 men employed here and Mr. Fairfield informed us that he expected to have everything in running order by December 15.

Shasta.

NOTES FROM IGO. — *Courier*, Nov. 29: Some parties from below are taking hold of the Chicago mine and intend to sink on it and develop the same. Robinson & Co. are still working on their group of claims. The Gem mine is being sunk on under the management of A. J. Mason. There is considerable talk of the D. C. T. & F. Co.'s property changing hands soon, as the people living on the line of the ditch are striving to form an irrigation district under the Wright law. Several meetings have been held at Igo and Happy Valley in regard to it. The arastras on South Fork are running on average ore. The China Co. is working a mine at Horsetown on a large scale.

Sierra.

ABOUT ALLEGHANY. — *Mountain Messenger*, Nov. 29: Prospects are bright for a boom in quartz at this place and Chips next year. Wm. Hanley has run 500 feet of tunnel for the old Golden Star lead, at Rapps ravine, and expects to strike it 700 feet ahead. He is going below soon for the winter and Geo. Connors will continue the work for him. John Fessler is still hammering away in bedrock at his claim near Alleghany, and running a tunnel. B. B. Lewis, lately from Pino Altas, New Mexico, is assisting him. Golden King ledge is owned by A. Nihill, H. L. Johnson and G. C. Haskell, who have been crushing quartz with an arastra for the past five months with favorable results. They believe they have as good a milling ledge as there is in this part of the county, as thus far proved. Chimney averages in width from eight inches to five feet. Jas. Clinton is working on the Smith ledge for Chas. Heintzen, the owner, and has fair-looking quartz. J. T. Bradbury continues working at the Sherman ledge, and is raising from the first to the second tunnel, about 70 feet, and as far as he has gone, obtained arsenical sulphurets, which prospect exceedingly well. Wm. Wright is preparing to develop his gravel mine at Kanaka City, this winter. H. H. Brown is employing two men to develop the Kenton ledge, with which the Eagle has been consolidated. This promises to soon become good milling property. J. E. McCormick is working at the Buckeye mine.

CHIPS' FLAT. — Wm. Harp has, report says, taken out over $2000 from his quartz ledge near Chips, this year, which promises well for the future. L. Evans is taking out pay gravel at Chips. The buildings at Chips were mostly covered with snow last winter. A good 12 feet fell. Chas. Roussan is running a tunnel at Oak Flat Ranch seeking for gravel. Some very good-looking quartz is being taken out of the old drift claim at Fir Cap diggings. The ledge was discovered many years ago in working the old gravel diggings.

MINING ITEMS.—*Tribune*, Nov. 28: The Mountain mine has closed down and Supt. Harper has discharged all the men. Much bad luck has been encountered in putting up the new tramway. It broke last week and the mill had to be stopped until repairs could be made. Just as they got it fixed and in good running order it broke again. This is bad news. The mine will remain idle now until new machinery can be procured. A. W. Edwards has let a contract to John Egbers and another party to run 2000 feet of tunnel at his quartz claim up at Gold lake. Mr. A. C. Busch has begun operations at the Phœnix quartz mine. Several men have been put at work there and supplies have been sent up. C. W. Hendel is here doing some surveying for A. C. Busch at the Phœnix mine. Owing to a scarcity of water it has been found necessary to shut down part of the stamps at the Wm. Tell mine.

PROSPECTING.—Tony Grass and Peter Keifler have returned from their prospecting and hunting trip to the Middle Fork. They were gone five days. Tony reports game very scarce up that way. They found a good ledge, however. It is 18 inches thick and the rock shows well with galena.

Siskiyou.

GOOD GRAVEL. — *Telegram*, Nov. 29: George Graves of Honolulu, who is one of the contractors in sinking a shaft at that place for Chas. Junker of this city, was in Yreka Thursday and informs us that pay is very good in the shaft, averaging $25 to the foot, and as they sink above one foot per day it is equal to $12.50 a day per man. He also reports everything as looking favorable for nearly all the other mines in that vicinity. The Rummel mine on the Klamath is being improved by the putting in of a new pump received from San Francisco.

QUICKSILVER DEPOSITS.—Yreka *Journal*, Nov. 26: Preparations are being made by the Siskiyou Consolidated Quicksilver Mining Co. to work their cinnabar ledges or chimneys at head of Beaver creek, Siskiyou mountain, during the entire coming winter, at which at least a dozen men will be employed. In the spring, operations will be carried on more extensively, with the addition of more workers. The advance in silver has also created a greater demand and better prices for quicksilver, which can be obtained in large quantity and superior quality in the foothills of Siskiyou mountain, this side of the Oregon boundary line. The work is under the supervision of Mr. Magee, an experienced and skillful quicksilver miner, who is also noted as an expert snowshoe traveler, formerly residing in the Sierra Nevada snow-belt region of Sierra and Nevada counties. The process of working the quicksilver mines on West Fork of Beaver Creek, in the Siskiyou foothills, will be by means of roasting furnaces, said to be more effective and less dangerous to the health of operatives than the old-fashioned style of retorts. With furnaces, the cinnabar containing 18 to 20 per cent of quicksilver, can be worked profitably, while it takes ore containing 50 or 60 per cent for the retort process to prove profitable.

NEW QUARTZ-MILL.—Ed Sheffield at White Gulch, near Sawyer's Bar, intends putting up a larger quartz-mill than the old one formerly used, and will build it lower down so as to secure greater water-power with the advantage of being able to run the mill all the year round.

Trinity.

LOOKING WELL.—Trinity *Journal*, Nov. 29: The Yellowstone mine on the East Fork is looking well and the mill is running steadily, but the water-supply is only sufficient to run five stamps. These stamps are doing good work, judging by the amalgam in the battery and on the plates. Mr. Hughton will take charge of this property as soon as he is able to get about. At present he is on the sick list and Mr. Skinner is superintending the work.

HAS A GOOD OPINION OF IT.—The Golden Chest M. Co. is running a deep tunnel to tap its ore chute 150 feet deeper than the present level. Mr. Whittier of San Francisco, a wealthy owner in this mine, thinks more of it than any contract he ever had.

Tuolumne.

DRIVING A TUNNEL. — *Independent*, Nov. 29: Work on the Cosmopolite mines is progressing under the superintendence of Wm. Pool. A tunnel is being run to strike the shoot below the old works that yielded many bonanzas in good old days gone by.

NEVADA.

Washoe District.

ON THE COMSTOCK LODE.—*Territorial Enterprise*, Nov. 29: There has been a better feeling in the last few days in the San Francisco mining share market. This has in part been due to the continued successful working of the Dow pumps in the Crown Point mine, and in part to favorable developments in the Overman. The pumps at the Crown Point will drain a large area of mining ground. It should not be a matter of surprise were the lowering of the water to proceed very slowly after the drainage has attained a depth of 200 or 300 feet, as there is in all the surrounding ground the accumulated water of years. This will flow into the openings that are being drained under a heavy and constantly increasing pressure as depth is attained; but once it is out of the ground it cannot return to be again handled. When the old workings have been drained to the bottom only the daily and regular flow—whatever that may prove to be—will remain to be handled by the pumps. There are no discouraging features at any point in the workings of the leading mines; on the contrary, the exploring drifts in several mines are showing ground of a favorable and fertile character. The finding of hunches and stringers of ore, even though of low grade, is always a promising indication, as it proves that the ground is of such a nature that "ore can live in it," as the miners say. There is still an abundance of water in the Carson river, and all the mills on that stream are kept in constant operation. Also the weather continues fine for all kinds of work. The following information has been gathered from the weekly letters of the superintendents:

BEST & BELCHER.—On the 800 level west crosscut No. 1 has been extended 25 feet; total length, 325 feet; formation, porphyry, clay and quartz. On the 1200 level upraise No. 1 has been carried up 10 feet; total hight, 81 feet; formation, hard porphyry.

GOULD & CURRY.—On the 200 level the northwest drift has been extended 12 feet; total length, 107 feet; formation, quartz of fair quality. On the 250 level, west crosscut No. 1 has been extended 10 feet; total length, 35 feet; formation quartz, showing some value. On the 400 and 450 levels from the old stopes have extracted 45 tons of ore of fair quality. On the 625 level all work is confined to repairs.

CROWN POINT.—Shipped to the Mexican mill during the week 407 tons of ore, the average battery assay of which was $13.78 per ton.

YELLOW JACKET. — Shipped on an average 78 tons of ore daily to the Brunswick mill; the battery assays average about $18 a ton. The usual prospecting work is going on on the different levels.

SEG. BELCHER & MIDES.—The 1100 joint east crosscut was advanced 29 feet; total length, 180 feet, and stopped in the hanging-wall. It passed through the width of about 6 feet of quartz, which assayed from $5 to $25 per ton, but below the paying grade of the average. This quartz will be further explored

to the southward on this level and also on the 1200 level, where the crosscuts have not been far enough east to cut it.

KENTUCK.—The 1000 level east drift has been advanced 10 feet during the week, making its total length 168 feet; face in porphyry and low-grade quartz. The west drift on the same level is out 176 feet, having been advanced 11 feet since last report; face in soft ground, composed of clay and porphyry. The north drift from the 950 east crosscut is out 30 feet; face in quartz showing spots of ore.

BELCHER.—No particular change to report of the stopes. Shipped to the Vivian mill during the week 266 tons 500 pounds of ore, the average battery assay of which was $19.26.

CHOLLAR.—Extracted and sent to the mill the past week 535 tons of ore. Average battery assay, $21.85.

POTOSI.—The north lateral drift from the winze station, 1130 level, is out 190 feet; face in porphyry. North lateral drift from winze station 1230 level, is out 48 feet; the face in porphyry. The south lateral drift from winze station, 1230 level, is out 130 feet; face in porphyry. The south lateral drift from the main incline, 1230 level, is out 628 feet, face is in porphyry.

WARD COMBINATION SHAFT.—East drift from the 1800 station is out 700 feet; face in porphyry.

CON. NEW YORK.—The north drift on the 650 level is in 85 feet; face in porphyry. North drift, 850 level is in 431 feet; formation porphyry. The north drift, 1100 level, is in from the shaft 302 feet; formation quartz and porphyry.

SAVAGE.—During the week have hoisted 946 cars of ore from the 300, 400, 500, 600, 750 and 1300 levels. Shipped to the Mexican mill 492¾ tons of ore and to the Rock Point mill 332¾ tons. Milled during the week 735 tons, the average battery assay of which was $20.05 a ton. Have bullion on hand and at the mills amounting to $33,755.33.

ALPHA.—East crosscut 70 feet north of shaft, 600 level, is out 170 feet; formation, porphyry.

HALE & NORCROSS.—We have retimbered 65 feet of the incline below the 1300 level, 40 feet having been newly timbered during the past week; we are also repairing the main vertical shaft.

CON. CAL. & VA.—Ore continues to he extracted from the 1200, 1300, 1500, 1600, 1650 and 1750 levels. Ore of a fair quality is found in places on all these levels. About the usual amount and quality of ore will be shipped to the mills on the river during the week.

OPHIR.—The west drift on the 1300 level continues to show bunches of ore. Ore is also being taken from other points, the average assay of which is a little over $21 a ton.

MEXICAN. — East crosscut No. 1 on the 1465 level continues in porpbyry.

UNION CON.—On the 1465 level, east crosscut No. 2 is still in a soft porphyry formation which shows frequent seams of clay.

SIERRA NEVADA.—The main west crosscut is still being advanced in a favorable mixture of porphry, clay and quartz.

In Con. Imperial & Challenge, Exchequer and Silver Hill the usual amouot of exploratory work has beeo done duriog the week.

JUSTICE.—The north drift, 370 level, was advanced 20 feet during the week, making its total length 208 feet. Face shows three feet of ore giving assays of from $5 to $25 per ton. Shipped to the mill during the week 196 tons 1685 pounds ore, the average battery assay of which was $20.47.

Ely District.

THE FURNACE.—Pioche *Record*, Nov. 22: The furnace, under the efficient managcment of Supt. Weroer, cootinues to run like a clock. From 50 to 60 tons of ore are smelted every 24 hours. Teams are steadily hauling ore aod coal and the force at present employed keeps the furnace going, and if we do not have a very heavy winter a continuous run may be looked for during the winter months.

YUBA.—The Yuba mine is looking better at preseot than it has at any time sioce it was opened. Under the management of Foreman Lloyd new drifts have started, new ore bodies opened. The winze oo the 1300-foot level is in ore that will average 100 ounces io silver per ton. All boisting is done to the tunnel level. The Yuba as it now stands is one of the best pieces of mining property on the Pacific Coast.

Pine Grove District.

THE PINE GROVE MINES.—Carson *Tribune*, Nov. 25: Hoo. J. L. Wilson, ex-Assemblymao from Esmeralda, returned to Pioe Grove yesterday with his gripsack well filled with coin, the proceeds of several gold bars made from last month's run. The Pine Grove mines have already produced about $4,000,000 in gold, and tbere is said to be plenty more in sight.

THE WOLVERINE DISTRICT.—*Chronicle*, Nov. 26: Messrs. Fitzmeyer aod other owners of the Badger and Wide West claims in this district, about 12 miles northeast of Virginia, and supposed to be a continuation of the Comstock, are getting out very favorable rock. Some of the rock examined by experts carries a good deal of gold, and all the character of the rock is good enough to have shipped to Salt Lake to be worked.

Hawthorne District.

WORK TO BE RESUMED.—Walker Lake *Bulletin*, Nov. 26: The prospects are good for a general resumption of work in Hawthorne district this winter. It is too bad that the richest mining district on tbe coast should remain undeveloped. The owoers of the gypsum mines near Lovelock bave commenced operations. Roads are being built to the mines, and the deposit is being opened. This is said to be the best and largest gypsum body in tbe world. It is expected that work will be resumed in the Pamlico mine some time oext month. It is reported that the miners in the Big Indian mine have struck a ten-inch vein of rich ore. The Lapanta is producing bullion right along. The prospects are very encouraging io this mine.

THE MOUNTAIN QUEEN.—Good work is being done at the old Columbus Con. mine, near Candelaria. Eastern capitalists have placed a large amount of money io the property, and under the supervision of Mr. Chas. T. Warren it is believed that the mine will soon be a large dividend-payer. The property is now called the Mountain Queen.

STATE LINE MINES.—Indications are good for a bang-up camp at Gold Mountain. The State Line Con. Gold Mioing Co. is paying up old bills and intends doing developmeot work oo the State Line mines, Lew Hanchett has charge. John B. Truman has sent in for county license to do merchandise and boarding-house business.

LOOKS LIKE BUSINESS.—White Pine *News*, Nov. 22: We learn that the Eberhardt Co. has purchased the Green Springs property (Freeland's place), nine miles below Eberhardt. The object of the purchase is said to be to use the water for milling purposes. The company considers it cheaper to haul the ore to the Springs than to repair the old water-works, which are in a dilapidated condition. As the purchase was doubtless at the instance of the chairman of the company, who is on a tour of inspection of the property, it looks as if the old Eberhardt meant to resume operations at an early day.

ALASKA.

FROM THE MINES.—*The Alaskan*, Nov. 12: At the several localities where vein mining is in progress this branch of the business is being actively and successfully prosecuted. As a general thing, however, the season has not been a prosperous one with the placer miners, the warm weather setting in late, much rain falling and many of the streams remaining high until late in the summer. The census nearly completed, shows the population of Alaska to be about 31,000, divided as follows: Whites, 2000; Creoles or half-breed Russians included, a little less than 5000; Esquimaux, about 17,000, Athabascan Indians about 8000; Aleuts 1000; the pure-blooded Russians not exceeding half a dozen.

ARIZONA.

FROM THE MAMMOTH.—Tucson *Star*, Nov. 25: The latest reliable news from the Mammoth country is that the Mammoth mine and mill are running steadily on Mammotb ore, and the mill, under Baron Inderstroth's able management, is turning out gold bullion galore. The strike in the Table mountain mines, which the *Star* mentioned casually a short time since, is now fully confirmed. This ledge samples across the 22 feet $86.40 in gold and 13½ per cent of copper. This find is an assurance of a permanent camp upon the valley of the San Pedro, and Tucson people must look to their interests and see that the proposed road is built, for Tucson is the point upon the railroad from wbich this promising district must naturally draw its supplies, and we predict a great increase in traffic to Mammoth, as we know of two plants about to be erected in that vicinity.

NEW PROCESS.—Tombstone *Prospector*, Nov. 23: One of the most important questions to be solved before Arizona can expect to become prosperous to the degree for which Nature has fitted her, is that of working the ores that are so abundant in every mountain range, but which have not been touched for lack of water with which to reduce them. The first attempt to cut away from the water proposition and experiment with a dry process was made, or rather is being made by the Silver Chief M. & M. Co., which has just filed articles of incorporation. The plant alone after erection cost close on to $75,000. The tramway which leads from the mine to the mills is one mile long and cost $20,000. The ore is handled but once, and after leaving the mioe is not touched until it is in the shape of concentrates. The three mills crush 40 toos of ore per day of 24 hours, and the concentrates represent as compared to tbe ore rate of ooe to five, that is, five tons of ore which runs in gold and silver $30 per ton is reduced to concentrates worth $150. The only water used is for the boilers of the power used to run the mills and concentrator.

BRITISH COLUMBIA.

SILVER MINE.—Kamloops *Sentinel*, Nov. 22: Some miners have been doing work on a ledge located by them last summer, about 60 miles up the North Thompsoo river. They have sunk 30 feet on the ledge and drifted 17 feet, and are satisfied they have located a valuable property. The ledge is three feet wide aod looks exceedingly rich. Assays from samples brought down, Mr. McDooald says, do not indicate that it is a low-grade ore, though he does oot care to make public the exact result of the test uotil he cao bring a larger quantity down. He has worked hard and with little eocouragement for years at prospecting, and it is gratifying to know that he is likely to be well rewarded for bis determined efforts. He cao get any amount of capital to work the claim and is saoguioe of making a good stake. He predicts lively times prospecting and mining up the North Thompson next season.

REVELSTOKE NOTES.—*Star*, Nov. 25: A sample lot of two tons of gold ore bas been received at the smelter this week, shipped in hy M. S. Davys. It is from Rover creek, which runs into the Kootenay river between Sproat and Nelson. The sample runs high in the yellow metal.

PAY GRAVEL.—*The Miner*, Nov. 26: John Loge, an old-time placer prospector, who would rather locate 100 feet of pay gravel than 10,000 feet of low-grade quartz croppings, is the lucky finder of a placer claim in the Toad Mountaio district. While prospecting with Sam McCaskill, they struck what they were in search of on a creek that empties into Salmoo river. The discovery ground is oot more tban six miles from tbe Hall mines and is easily accessible. The diggings are sballow and the gold coarse. The 14 pans washed yielded between $3 and $4 in gold, ooe pan yielding over a dollar's worth. Mr. Loge estimates the diggings to be worth fully an ouoce a day to the man. A rusb may be expected to the creek early in the spring, as there is plenty of water and a considerable area of workable ground. While the output of our placers will never equal that of our quartz mines, tbe yield from this new creek, combined with that from the hydraulic claims on Forty-Nine creek, will help to swell the total output next year up to a figure with six ciphers after it.

COLORADO.

THE LARGEST IN GILPIN COUNTY.—*Register-Call*, Nov. 28: The largest ore-producer in Gilpin county at present writing is that of the San Juan on Quartz hill, which bas a daily output of 16 cords. The mine furnishes a sufficient amount of ore to keep 70 stamps running daily—30 at the Hidden Treasure mill and 40 at the New York stamp-mill in Black Hawk. At a safe estimate there are 500 cords of ore broken in the mine ready to be hoisted to surface for treatment, whicb at an average of 8 tons to the cord would be a total of 4000 tons of ore.

COLORADO'S PROGRESS.—*Mining Industry*, Nov. 26: The Rio Grande Southern, which will give railway facilities to the rich mining region surrounding Telluride, Ames, Front Lakes and Rico, is now completed nlmost to Telluride, a distance of 50 miles from the starting point at Dallas. So far as one can judge from surface indications, and from the comparatively little development that has been done, there are few regions in the world which equal it. The richest ore which goes to any market in the world comes from there. The Sheridan, Smuggler, Union, Mendota, Virginius, Enterprise, and others less known to fame, are shipping ore all the time in carload lots which runs from $300 to $5000 per ton. A carload of ore from the region which brings $30,000 is no uncommon thing.

SAN JUAN COUNTY.—Silverton *Miner*, Nov. 22: The Yankee Girl is stocked for $2,500,000 divided into 280,000 shares at $10 each, and the stock is non-assessable. The shares are worth to-day $5 each and a dividend of 50 cents a share was declared October 3d, making the entire amount paid by this mine $1,325,000. Development on the North Star on Solomon is proving all that was anticipated of the recent rich strike. It is undoubtedly the finest body of gray copper in the county. The owners, who have always been conservative in matters of this kind, think the new ore body is worth anywhere from $750,000 to $1,000,000.

PITKIN COUNTY.—Aspen *News*, Nov. 27: The Aspen Mining and Smelting Co. in common with all the other producers of the camp, is in a bad fix because of the failure of the railroad companies to furnish sufficient cars for the transportation of ore. The company has, at several times, had agreements with one road or the other to furnish from seven to eight cars daily, but the railroads have not been able to live up to their contracts. The company has been making a good record, notwithstanding the many difficulties under which it has labored. Regular dividends have been maintained, and there is now a sum in the treasury sufficient to pay the next three.

CLOSED.—The Smuggler mine was compelled to shut down yesterday for want of cars. This will take 60 tons a day from the output of the camp. As there is no prospect of cars to meet the freight demand, the mine will remain closed indefinitely.

IDAHO.

CŒUR D'ALENE.—Wardner *News*, Nov. 22: A. B. Campbell keeps 75 men on the pay-roll of the Milwaukee M. Co. The Gem mine is looking better than ever, and averages a shipment of one carload of concentrates daily.

BLACK BEAR.—The new mill of the Black Bear Co. was started up for the first time on last Sunday. The machinery worked to a charm and was run long enough to pronounce its trial a success. The electric plant was tested on the same day and proved in every way satisfactory.

KETCHUM'S PRODUCT. — *Keystone*, Nov. 29: There was shipped from this place during the week just closed 383,229 pounds of ore and 89,481 pounds of bullion.

WAITING FOR TRANSPORTATION.—The Elmore *Bulletin* says that there are good gold mines at Pine Grove on the South Boise river, 12 miles from Junction bar, but the gold is mostly in the iron pyrites, and adds: Should the cootemplated railroad be built along the South Boise it will penetrate one of the best mining regions in Idaho.

LOWER CALIFORNIA.

FROM THE MINES.—*Lower Californian*, Nov. 27: Some excellent specimens of gold, silver and iron ore were brought in from Guadalupe valley the past week by Matias Moreno and Juliao Rodriguez. They also show fine specimens of talc from a mine recently discovered, and which promises to become a source of wealth to the owoers.

A SPECIMEN of silver ore from a ledge situated within three miles of town is exciting the interest of mining men in Ensenada. As the finder of the ledge has not yet denounced it, the particulars are known to but few persons.

RUMORS are current that rich mineral has been found in the Purisima valley, 300 miles south of here.

MONTANA.

VARIOUS ITEMS.—*Review*, Nov. 28: A rich strike is reported in the Dandy mine, Seven Mile district, of three feet of ore, which assays 60 per cent lead per ton. This property is owned by J. Kingsley, of St. Paul, Mino., who, about a year ago, bought it from J. A. and F. C. Hudson. Mr. R. A. Bell, of this city, has some as fioe samples of Montaoa marble as we have ever seen. It comes from near Blackfoot City and will hold its own with Italian marble in beauty. Ore shipments continue from the Cumberland mine at Castle. A fine body of copper ore is said to have recenlly been encountered in the Comstock lode, Basin district. The new placer diggings discovered about four mooths since in Freoch gulch, Beaverhead county, are said to be producing considerable gold. A gentleman in the city from Phillipsburg last Saturday, states that large quaotities of ore are being shipped out of tbat city from the Flint creek mioes. The Bi-Metallic has declared its regular monthly dividend of 35c, aggregating $70,000. The Granite Mouotain Co. have applied for and obtained patents for 31 mining claims this year.

A BIG SMELTER.—*Inter-Mountain*, Nov. 20: The Butte & Boston Co. has decided to build a 3000-ton smelter at Great Falls, and to do so without unoecessary delay. Some of tbese days Great Falls is very likely to become the second city in the State.

NEW MEXICO.

COPPER, SILVER AND IRON.—Rio Grande *Republican*, Nov. 22: The copper and silver properties of the Organ mountain regioo are showing up superbly. Ao expert coal miner claims that a coal measure runs east of Las Cruces only three or four miles. He claims that it is the same as the Carthage coal belt and that black sbale and sandstone crop out in places. Al Culver and Al Dowos were out to their prospect six miles west of Randall station, this week. They brought in a sack of iron ore which runs about $6 per ton io gold. They have a shaft down 20 feet and prospects for a mine are good. J. F. Berry of El Paso was up this week to see a prospect in the Organ mountains which assays $78 in gold. It is claimed that there is a 3-foot lead.

SHIPMENT.—A carload of ore goes from the Home claim this week to Joplin, Mo. It is of zinc and lead.

REORGANIZED.—*Southwest Sentinel*, Nov. 25: It is reported that the Billings Smelting Co. at Socorro has recently been reorganized, and that Colorado capitalists now control the concern

RICH ORE.—J. J. Dodd, general manager of the Alhambra Silver Mining Co. of Silver City, was in Socorro on Wednesday last, with about three tons of ore from that famous mine, taken from the shaft while sinking a distance of a little over ten feet. The ore, we should judge, is worth from $5000 to $6000.

OREGON.

HYDRAULIC MINING. — *Plaindealer*, Nov. 22. According to the report of B. C. Ward, engineer of the Myrtle Creek mining ditch, 10 of 27 miles will be completed in a few days. This ditch will be an average of five feet at the top, three feet at the bottom and two feet deep. The water will be taken out of the East Umpqua river and led over to Myrtle creek. The company has ordered 200 feet of 15-inch hydraulic pipe and two giants of 1000 pounds each. They propose to work the mines this winter with both giants. Southern Oregon opens a fine field for hydraulic mining, there being many valuable properties of this kind in that section of the State. The conditions here for operating by the hydraulic method are exceptionally good, nor is there any danger of their ever being interfered with by the land-owners, the Government or any other parties.

THE PINE CREEK MINES.—It is said that Cornucopia, the seat of the Pine Creek mines, is more prosperous now than ever before since the discovery of the camp. The Oregon G. M. Co. is carrying on its operations more extensively than ever, and other mine-owners are prospecting work industriously.

SOUTH DAKOTA.

SPRUCE GULCH.—Deadwood *Pioneer*, Nov. 27: Discoveries of ledges carrying 26 ozs. silver and $4 gold per ton have been found in Spruce Gulch. It is hoped that this will prove a valuable addition to the mineral industry of that district.

GALENA.—The Ontario mine at Galena is improving with every fresh foot of development. The main tunnel is in about 300 feet and shows all the way a vein of carbooate ore, ranging all the way from four to six feet thick, that will average $45 a ton. Crosscuts have been run from the tunnel for a distance of 40 feet, and in no case have they been out of ore. Some high-grade lead ore is also found in this mine.

WILL START UP.—Supt. Havens, of the Richmond, intends starting up the mill at Galena next spring. It will be run principally on ore from the Richmond, but custom ore will also be treated. There is a large amouot of dry ore in Galena that can be worked in the mill, but will not pay the expenses of shipmeot to Omaha.

UTAH.

A BIG SMELTER NEEDED.—*Tribune*, Nov. 27: Salt Lake City was for a long time regarded as the best ore market in the West. Perhaps it has lost oone of its advantages, having good local smelting plaots, besides buyers of ore for the Denver and other markets. The time has come for a great smelting and refining plaot here. There is no reason why we should send a pound of ore to Denver, Omaha and other places, except that the present smelting plants here are not large enough to use up all the ore produced here, and then the railways like to carry out the ore, while the local buyers, of course, work for the concerns for which they are agents. The *Tribune* believes that one of the largest smelting works in the West will soon be located somewhere in the vicinity of Salt Lake City.

TINTIC DISTRICT.—The vein of ore in the Wolf is becoming larger and richer. Mat Condon has been looking after his mining ioterest here this week. Aoother big strike of horo silver ore is reported io the Centeonial-Eureka. Seth Brelsford has locatcd a claim which he calls Free Coinage, because people cry for it. The Keystone is sacking a great deal of ore, it being too rich to sbip in the ordinary manner. The Lancaster has considerable ore on the dump, but will not ship until silver comes up a notcb or two. A very promising claim was located this week by D. J. McKinnon, G. T. Bridges, W. H. Kissinger and Seth Brelsford. It lies west of the Jenny Liod Springs and has an old shaft on it which sbows a 13-foot vein. An assay will be obtaioed soon. It is a wonder that the ground was not relocated long ago. About 200 location ootices have been sold at this office this month, which is a gentle hint that if you want ground in this district you had better get it soon. The body of horn silver recently struck in the Keystone and mentioned in these columns last week is proving to be a bonanza of the biggest kiod. It is stated that $7,000,000 was receotly refused for the Gemini group, of which the Keystone forms a part. O. P. Rockwell brought some rich lead ore, carrying high in silver and gold, to town, Wednesday. The ore was obtained from the Mammoth, located 60 miles west of this district. He says he has a 13-foot veio of ore, and if oit is all as rich as the samples the property will rival its famous namesake. The mine is owned by Mr. Rockwell, Milt Price and James Chipman, the latter of American Fork. The ore was struck at a depth of 40 feet.

WASHINGTON.

KOOTENAI.—*Spokesman*, Nov. 25: There will be much work done in the Lower Kooteoai country this winter. There is no reason why a large smelter should not be put up there, as they have the material to build one and the ores to keep it running. The Hall people have just finisbed sending out 2500 tons of sacked ore. They say it will run $400 and $500 to tbe too. Of course it is picked ore, carrying silver and copper. The natural outlet for ores in that region is this way. The Halls will keep right on: Dr. Campbell will work quite a force on his claims at the Hot Springs. Winter work will be kept up at the Dandy, the Silver King and the Wheeler claims, all with quite a force.

MECHANICAL PROGRESS

Iron vs. Steel for Railroad Axles.

It seems not a little strange at this time of day for steel to be replaced by iron, yet it is stated that such a change is being made in respect of axles for some of the Indian railways. The exact reasons for the alteration have not as yet been made known clearly, but the new state of things is in operation already—the Bombay, Baroda & Central India Company having contracted for 3000 Lowmoor iron axles, to be delivered at the rate of 500 monthly. The substitution of iron for steel in this respect is so contrary to the general tendency of metallurgical practice that we are entitled to make very thorough inquiries on the subject. Having done so, all we can ascertain is that Sir A. M. Rendel, whose list has served to effect the alteration, is of opinion that "commercial steel when used in axles seems subject to deterioration, which makes it very brittle after a few years' wear." This very serious indictment of steel is to some extent supplemented by the following further statement of the same gentleman:

"I originally recommended the use of steel for axles on the Bombay, Baroda & Central India meter gauge because I thought that steel was not only better than iron, but because its price was not more than half that of the class of iron suited for axles. I was further moved to do so by an opinion that, while steel was improving in quality and daily taking the place of the best classes of iron, the quality of those classes of iron must deteriorate, because the price obtainable for them must diminish. In respect to the relative price of steel and iron, I was quite right; in respect to their relative suitability for axles, I have been wrong, or, at any rate, premature."

Until full particulars are furnished, all controversial discussion on the subject must be purely academic, but with the very practical drawback for the steel-axle makers that Indian orders are being lost to them. As a matter of theory, as well as of natural commercial rivalry, there is plenty to be said on behalf of both kinds of axles; but it is a very strong argument for steel that, on every leading line of railway in Great Britain and the majority of lines in other parts of the world, steel axles are in general and successful use. As nothing is said to succeed like success, this is probably the strongest argument which can be used by the makers of steel axles. They have plenty of other arguments. Steel is about half the price of iron for this purpose. The steel is made with the greatest certainty and regularity, and resulting freedom from mishaps. Anywhere out of India a locomotive superintendent adhering exclusively to puddled iron axles would be looked upon in the same light as a gunmaker who used iron for modern big guns, or the shipbuilder who used best Yorkshire iron for the skin-plating of his vessels.

What the steelmakers lose, however, the iron-axle manufacturers will gain, and it is only just to the latter to say that they make a very good fight for their old-fashioned, but, as they claim, safer material.

MACHINE MADE TOOLS.—There are very few lines of manufactured articles that have not undergone wonderful changes, especially in the means and methods of their production, in the last half century. Hand work has been succeeded by machine work, and notwithstanding the very common argument against this change, the claim being made that the quality of the work is thus less accurate and perfect, it is a fact that not only is it more accurate and perfect, but every piece is exactly alike, the quality equally good, and the quantity largely increased. A machine once carefully and accurately set and kept in proper repair never varies. The work is uniform and true. An example of this is well illustrated in the manufacture of that very useful article in every shop and factory, the file. It is but a few years ago that these were all, or nearly all, made by hand, enhancing their cost and not materially increasing their durability and service. To-day nine-tenths of all the files used in this country are made by machinery. The competition in the business, largely controlled by quality, has worked to make their manufacture one in which the most perfect machines are necessary, and this spirit of rivalry has brought the machines to such a state of perfection that wonderfully fine and accurate work is accomplished by them. With the machines now in use, a file is cut with teeth varying from 14 to the inch to a number so fine as to require a magnifying glass to count them, and as accurate and perfect in shape as the coarser cuts. For their production about 5000 tons of specially prepared steel are consumed annually.

HARDENING CAST IRON.—We are informed that the Abbott Machine Co., 47 and 49 South Canal street, Chicago, have lately been conducting some very satisfactory experiments in hardening cast iron by a new chemical process. Briefly described, the mode of procedure is as follows: The iron is put in a furnace and heated to the proper temperature, when the chemical is put on the upper side and goes right through it, so that when cool the under side is as hard as the upper side, and when broken the iron is as hard inside as outside. No trouble is experienced in going through six inches, and the chemical can probably go through any reasonable thickness. In Chicago it is being used for hardening brick dies made of cast iron, whereas heretofore brick dies were necessarily made of steel. This is a great saving both in material and work. Another use is for shoes on grips of cable cars, the iron shoes formerly used sometimes not lasting more than one trip.—*Western Machinist.*

SIMPLICITY IN DESIGN.—Next to good fitting, there is nothing which tends so much to the good repute of a mechanic and his products as persistency in some simple form or style in the finish and ornamentation of his work. If the work be a machine, all of the visible shafts, bolt, stud and nut-endings should be turned or milled carefully to the same general shape or form. There is nothing so neat and appropriate as the simple reverse curve style, free from corner or head. Inward corners should always be avoided. There is nothing so discouraging in machine cleaning as complicated headings, or in house cleaning as complex moldings; they are only dirt-catchers, void of beauty. It is no light task to keep a complex machine like the railway engine clean and tidy; the finish and ornamentation of such machines should by all means be made as simple as possible. Neatness and utility should be the only objects in their construction, and elaboration in the way of show should be avoided. The propriety of using so much brass in the external finish of locomotives has been questioned; it tarnishes so easily that an almost continual rubbing is necessary to keep it bright, imposing a tremendous task on patience and muscle. Paint and varnish judiciously applied occasionally, especially to all of the large surfaces, such as cylinder and steam-chest casings, would be far more neat, economical and satisfactory.—*Ex.*

THE GROWTH OF INVENTION.—It would be impossible to make the circle any rounder, or a right angle greater or less than 90°, or the circumference of a circle greater or less than 3.1416 its diameter, yet it does not follow that mechanical combination is at an end or even approaching it. The growth of invention is much like that of the banyan tree, whose branches turn over and extend to the ground, take root, and each duplicate the operation, the new growths repeating indefinitely. The invention of George Stephenson was a trunk growth, from which has sprouted and propagated a myriad of inventions, called into existence by the requirements of railroad construction and service. Who would have thought of a car coupler before a railroad or car was thought of? Brakes, trucks, nut locks, rail joints, rails, in fact, every detail of construction has been copiously elaborated and the end is not yet. The discovery of electricity and the mechanical appliances following in its train is thrilling in its extent and scope, and no one can tell what is in store in the near future. It seems as if the floodgates are open, and inventions form a torrent which promises no ebb. So of numerous other "trunk" inventions that might be named.—*Ex.*

STEEL RAILROAD SPIKES.—Another illustration of the manner in which Bessemer steel is supplanting iron is seen in the announcement that steel railroad spikes will soon be put upon the market and made from soft Bessemer steel. It is not a great while since the change from iron to steel in splice bars was successfully made. Steel spikes have been made heretofore merely as an experiment, but a Pittsburg firm will soon put them upon the market for the first time for general use. For the substitution of steel for iron in this line of manufacture, there are several reasons. For some time past, old rails have been getting scarcer, until it has become impossible to secure an adequate supply for making spikes. Several causes seem to have combined recently to advance the price of muck bar, and consumers were practically compelled to look to Bessemer steel. Of course steel spikes will not immediately displace iron, as the first firm entering the market will continue to use muck iron. In all probability, however, steel will eventually drive out iron in this line. The opinion of railroad authorities is seen in the fact that at the latest convention of roadmasters, held in September last, the associations indorsed a steel spike in preference to iron.

OXIDATION AND MAGNETIC PROPERTIES OF MANGANESE STEEL.—Drillings of manganese steel, with 25 per cent and less of manganese, prove magnetic after being heated, according to Mr. L. T. O'Shea, in a paper recently read before the British Association. The cause seems to be an oxidation resulting in the formation of magnetic oxide of iron. When this oxidized steel is reduced by heating in hydrogen, the drilling appears powerfully magnetic, probably because the former iron manganese alloy has been destroyed, and metallic iron and manganous oxide, MnO, have been formed. Manganese is very susceptible to oxidation, but the determination of the exact proportions of the two oxidized metals is no easy matter. Filings show magnetism after heating, because the oxide coating adheres to the filings; when manganese or steel masses are heated, the oxide scales off and leaves the mass free from oxide.

AIR ABOVE BURNING COAL.—A certain amount of air admitted to the furnace above the live coal is advantageous rather than otherwise, if the supply be regulated. The oxygen of the air thus introduced assists in the more effective combustion of the gases.

SCIENTIFIC PROGRESS.

A HOUSE-FLY PARASITE.—An interesting entomological discovery has recently been made in New York. State Entomologist Lintner recently received from a Gonverneur lady an interesting parasite on the common house-fly, says an Albany dispatch to the New York *Times*. "It is not uncommon to find half a dozen on a single fly," the sender writes. They are exceedingly small, being no larger than the puncture in a piece of paper by a small-sized pin point, yet they are seen readily because of their light vermilion color. The favorite spot is on the body of the fly underneath the bases of the wings. The parasite is a mite of the group known as the "harvest mites," bearing the scientific name of *Trombidium muscarum*, and is similar to another species that attacks flies in Europe. The mite does not multiply, unfortunately, with sufficient rapidity to do much toward the reduction of the number of house-flies. While infesting the fly it is in the larval stage, and only after leaving it does it become mature and begin to propagate. For this reason it rarely comes under observation, and has seldom been recorded by entomologists. Another species of mite sometimes met with produces its young upon the house-fly with such rapidity that in a few days the body, head and limbs become completely covered with the parasite. The fact has been spoken of often that the usual number of flies were not seen this season. The reason for this would be interesting, whether an undiscovered parasite or some new form of disease has destroyed them.

OBEDIENT TO THE SUN.—It would almost seem as if our globe were always trying to escape from the thralldom of the sun, which, knowing how fatal to us such an escape would be, incessantly interferes to prevent it. If only the sun were to withhold that attractive power by which the earth is maintained in the course at present followed, dire calamity must result. This globe of ours is now hurrying along at a pace of 18 miles a second, and if the sun's attraction no longer restrained us we should not continue to revolve in a circle, but would at once start off in a straight line through space. Every minute would take us more than 1000 miles, and by the time 100 days had elapsed we should be twice as far from the sun as we are at present. His light and his heat would be reduced to one-fourth part of what we now enjoy. With every successive minute the sun's influence would still further abate, and it is almost needless to add that all known forms of life must vanish from the globe. It is, therefore, satisfactory to know that we possess every security that the sun's attraction will never decline from what it is at the present moment, and therefore there is no ground for any apprehension that life shall be chased from this globe by a dissolution of the bond of attraction between the earth and sun.—*Good Words.*

TORNADOES AND VIOLENT STORMS.—A special investigation of the subject of tornadoes has been carried on by Prof. H. A. Hazen, of the Government Signal Service, during the past year. Prof. Hazen divided the tornadoes into three classes. First, violent storms causing destruction; third, the most severe tornadoes; and placed in the second class all other known violent storms. While there were about 1000 tornadoes each in classes one and two, causing the death of 1071 people, an average of one person to two storms, and a loss of about $23,000,000 in property, yet there were but 58 tornadoes of a very violent character, killing 755 people and destroying property to the amount of $11,894,700, an average loss of 13 lives and over $200,000 of property to each storm of class three. It appears that in no State may a destructive tornado be expected oftener, on an average, than once in two years, and that the area over which the total destruction can be expected is exceedingly small. In the last 18 years the death casualties from tornadoes averaged 182 annually. While this is a large number, it does not appear to be as great as the death casualty from lightning. It may be safely assumed that, dangerous as are tornadoes, they are not so destructive to life as thunder-storms.—*Scientific American.*

DOES THE SUN GIVE LIGHT AND HEAT TO THE EARTH DIRECTLY, or is heat generated by the action of the sun's rays upon the earth? is a question which has interested and puzzled many of our best scientists. The *Scientific American* refers to the matter as follows: "The sun's heat is supposed to be transferred to objects by ether waves. These are not considered to be heat, but to be capable of producing heat when they impinge upon matter. The atmosphere being attenuated and thin in the upper regions, is less heated than in the more dense portions near the earth. The heating power of the sun is also very great at high altitudes when radiating upon surfaces properly prepared to receive and absorb the heat. The nearer we approach the sun, the more powerful are the radiations or ether waves."

EFFECT OF ELECTRIC LIGHT ON PLANTS.—A beautiful illustration of this was recently given by Dr. Siemens before the Royal Society of England by placing a pot of budding tulips in the full brightness of the electric light in the meeting-room, and in about 40 minutes the buds had expanded into full bloom. Dr. Siemens stated that he had planted a number of quick-growing seeds, such as mustards, carrots, melons, etc., and having divided the pots into four groups, had one group kept entirely in the dark, one exposed to the influence of the electric light only, one to the influence of daylight only, and one to daylight and electric light in succession. He applied the electric light each evening from 5 to 11 o'clock and left the plants in darkness for the remainder of the night. According to his observations, the plants kept entirely in the dark soon died; those exposed to the electric light only, or to the daylight only, throve about equally, and those exposed to both day and electric light throve far better than either.

LIGHTNING AND RAILWAYS.—It has been demonstrated on different occasions that lightning cannot strike a train. We see trains pass through a storm, running in the full evolution of the field to the point that the wheels are surrounded by luminous electric arcolas, and the way gives off sparks; the thunder growls inoffensively around and even above the train. This immunity is explained by the fact that the rails are never electrically isolated from the ground, and that they form conductors of great section, across which the atmospheric electricity is drawn by the nature of the materials constituting the train, and by its movements flows easily toward the soil. The theory well established, nature has charged itself to give it a complete contradiction. At Dischau (Prussia) an express train, running at the rate of 60 kilometers per hour into the station, broke down the buffing apparatus and traversed the interior facade of the station, breaking up against a neighboring house. An investigation established that the accident is to be attributed to the effects of lightning, which fell upon the train, killing outright the driver and stunning the stoker.—*Cosmos.*

CURIOUS FACTS.—A relationship between the flora of Eastern Asia and of Eastern North America was pointed out, as to Japan, by Dr. Asa Gray, 30 years ago. It has been illustrated since by discoveries of new species alike in both regions, but they have been for the most part unimportant herbs. Greater force is now given to the fact by the discovery, by Dr. Augustine Henry, that the Chinese and American tulip trees are identical. The discovery is significant in that it gives evidence that the climates of Eastern America and of China have continued to be alike since the Tertiary period. At an exhibition given by the Department of Microscopy of the Brooklyn Institute, exhibits were shown, and one of them consisted of teeth of a mosquito, showing 11 teeth at the extremity and upon the thin edge of each flattened, bristle-like mandible. Another side showed the stinging hairs of nettle, how the top of the sting is broken off on entering the skin while poison from the gland below is pressed through the tube of the sting into the flesh. Thus are insects and plants provided with instruments of torture for men, though these are only two minor examples of hundreds of tortures to which we are liable.

"THE RULE OF THUMB" is made of very important usefulness in China. In that country a traveler wishing for a passport is compelled to have the palm of his hand brushed over with fine oil paint; he then presses his hand on thin, damp paper, which retains an impression of the lines. This is used to prevent transference of the passport, as the lines of no two hands are alike. The cunning Chinese have also discovered that the impressions of no two persons' thumbs are alike, and also that the impressions of no one person's two thumbs are alike. The European police keep books of photographs to identify criminals; the Chinese police keep merely impressions of each criminal's two thumbs, carefully labeled and numbered. He may shave, he may appear young and lithe or old and crippled, but he cannot alter the impressions of his thumbs, which can at any time be traced on paper and compared with the impressions always kept in safe custody by the celestial detective force.—*London Globe.*

A MODUS OPERANDI FOR GETTING A SPARK.—A very simple apparatus for obtaining an electric spark is made by a German physicist. Around the center of a common lamp chimney is pasted a strip of tin foil and another strip from one end of the chimney to within a quarter of an inch of this ring. Then a piece of silk is wrapped around a brush, and the interior of the chimney is rubbed briskly. In the dark, a bright electric spark may be seen to pass from one piece of tin foil to the other each time the brush is withdrawn from the chimney. Many other experiments can be tried with this apparatus.

GLACIERS IN THE ALPS.—A recent survey has established the number of glaciers in the Alps at 1155, of which 249 have a length of more than 4½ miles. The French Alps contain 144 glaciers, those of Italy 78, Switzerland 471 and Austria 462.

PASTEUR'S RESEARCHES on the phenomena of brewing led him to discover a number of micro-organisms, the presence of which is the cause of serious diseases in beer and other fermenting liquids.

THE reported destruction of the Pyramids for building materials arose from the removal of loose stones at the base to lay bare the lower courses and display the structures to greater advantage.

ELECTRICITY.

Increase of Traction by Electricity.

We recently reprodnced from a tecbnical paper a statement, accompanied by wbat has been considered quite satisfactory proof, that an electrical current passing through the surfaces of contact of a car-wheel and a rail upon which it ran would greatly increase the tractive-power by increasing the friction between the wheel and rail. This increase was estimated at from 20 to 25 per cent with a current of 30 amperes. Now comes L. I. Blake, Professor of Physics in the State University of Kansas, who says he has made a series of experiments which show that there is no appreciable difference in the friction by adding the current to the ordinary friction. He made four wholly independent laboratory experiments, of course in a small way. His statement concludes as follows:

"The currents employed were not sufficient to produce heating at the surfaces of contact. Such heating would doubtless produce an increase of the coefficient of friction. The four wholly independent methods (which he describes with illustrations) would seem to justify the conclusion that the friction of rolling or sliding contacts is not affected by the electric current passing through the surfaces of contact, provided the currents are not strong enough to produce sensible heating effects. Whether such heating effects occur between wheel and rail in electric railways when transit is rapid, may well be called in question."

ELECTRICITY DIRECT FROM HEAT.—Among the many problems which electricians and electric inventors are constantly studying, none is more important than the one se to producing electricity directly from heat, without the interposition of dynamos or any other mechanical contrivance. In this connection it is interesting to notice a series of patents recently granted to Col. J. A. Price, of the Sorenton (Pa.) Stove Works, in regard to a new method of ventilating cooking stoves. In a patent, bearing date of July 29, 1890, the inventor broadly hints at electrical expression in his handling of the air currents in the oven. The approach to this result is gradual and is characterized by considerable caution in the following quotation: "The currents of air so produced also seem to exert an electrical effect in the oven, which I attribute to the movement and heated application to the oven, as there is an intensity of action not otherwise accounted for." He further says: "The products may be said to be oxygenated instead of carbonized . . . and thus become a useful factor, combining, so to speak, a chemical with the mechanical action of the air." It will be seen from the above that Col. Price does not as yet claim to have produced electricity direct from heat, but he seems to be on the way toward this desirable result. In regard to the oven, the system inaugurated appears to be one of a lower temperature than is generally necessary to do effective work, or lower than has ordinarily been considered safe. The claims are that even with this condition established more rapid service can be attained, while the loss through destructive distillation is greatly reduced.

THE ELECTRIC MOTOR'S WORK.—The New York *Sun* thus speaks of electric power, in which the various work of the motor is summed up as follows: In some cities, so far has the use of electric motors gone that it is possible for a man to drink, at breakfast, coffee ground and eat fruit evaporated by electric power. During the morning he will conduct his business with electrically made pens and paper ruled by electricity, and make his records in electrically bound books—his seventh-story office, in all probability, being reached by an electric-motor elevator. At luncheon he will be able to discuss sausages, butter and bread, and at night eat ice cream and drink iced water due to the same electrical energy. He will ride all about the place in electric cars, wear shirts and collars mangled and ironed by electric motors, sport a suit of clothes sewn and a hat blocked by the same means; on holidays ride a merry-go-round propelled by an electric motor, or have his tobogan hauled up the slide with equal facility; be called to church by an electrically tapped bell, sing hymns to the accompaniment of an electrically blown organ, be buried in a coffin of electric make; and, last of all, have his name carved on his tombstone by the same subtile, mysterious, all-pervasive and indefatigable agency. This may sound like a wild and exuberant flight of fancy, but it is simply a faithful statement of the manner in which electricity is being supplied to every one of the necessities and luxuries of life in America.

A NOISELESS MOTOR.—The new Westinghouse motor, which has been in operation on the Pleasant Valley electric road in Pittsburg, Pa., is causing considerable comment from patrons of the road. They have named it the "Noiseless." One of the officers of the road says: "There is above all the wonderful ease and quietness of operation, which causes the cars to run along with a wonderful smoothness and silence. This noiselessness makes the car at once conspicuous on our line, and people are enabled to converse in an ordinary tone of voice on the car, and the residents along the line are in great praise of it. Noise has been the great objection to all motors, and we have introduced the rawhide pinions on our motors; but even then they are not nearly so noiseless as the Westinghouse motors."

GOOD HEALTH.

Remedy for Diphtheria.

The great prevalence of diphtheria at this time behooves all persons to impart whatever knowledge or experience they may possess toward relieving distress and death from this quarter. Much information of this kind is often gathered from those who are not of the medical profession—in fact a very large part of medical progress during the last hundred years has come from sources outside of practitioners. It is with this in mind that we give the following extract from an article by a recent correspondent of the *Bulletin* of this city. The remedy suggested would be perfectly harmless even when not successful:

In 1876 I was in Oakland, and an entire family of six children were down with the disease; two of them died and two others were given up and carried into an adjoining room to die, while the parents gave their entire attention to the others to try and save them, when I dropped in upon the afflicted family. They were in despair and did not know what to do. I immediately asked if they had any strong vinegar in the house, and they said yes; so I told them to bring a quart or so and a coffee-pot with a long spout. Having procured these, I got the vinegar to a boil, and then I applied the spout of the coffee-pot to the mouth of one of the children who had been given up, so that it could inhale the steam of the vinegar. The effect was instantaneous, and the child, a girl of seven years of age, grabbed the spout of the pot to prevent its removal, as she got so much relief. In about 15 minutes she began to cough, and in doing so all the diphtheria matter which clogged the throat was thrown off and the child recovered. I applied the same treatment to the others with the same results, and the parents were overjoyed when they saw their darlings saved.

I also applied the same remedy on another occasion shortly afterward while visiting a family on Turk street near Mason. The doctor had given the case up and informed the grief-stricken parents that he could do no more, for the child—a bright girl of eight years—was beyond human aid. I told them to try the vinegar remedy and they at once did so.

The next night I met the father, and he was exuberant in his profusion of thanks to me, who he said had saved the life of his only child, as she was rapidly recovering. The effect of the vinegar steam upon her, as he described it, was precisely the same as in the former cases. As it is perfectly harmless, it might be as well for parents to try it and they may have reason to rejoice thereat.

CONTAMINATED ROPES.—Every housekeeper probably has noticed how rapidly wire rope and wire have taken the place of the hemp and cotton ropes once so much in vogue. The greatest friend of the wire-rope manufacturer is the humble but terrifying *cimex*. It is not so long ago that the majority of beds were corded; nowadays they are provided with wire mattresses. Not only this, but there are wire pillows, wire bolsters, wire cushions and wire upholstery lining. The reason of the innovation lies in the fact that wire offers no breeding-ground for vermin or for diseases germs. Rope does, and is therefore feared by the housekeeper. The same change is now taking place in respect to clothes-lines. A few years since it was found that the old fashioned ropes harbored minute life, and in some instances was infested with the spores of scarlet fever, croup and smallpox. The moment the discovery was made public there was a rush for wire clothes-lines. In 1860, there was not one yard of it in use; to-day there are thousands of miles employed. Similar causes have led to the substitution of wire rope and chains for sash cords. The changes have injured the prosperity of the little insect in question, but have been a godsend to the makers of wire and its products.

DANGEROUS FLOUR SACKS.—The recent poisoning of a number of persons in a town in Maryland by eating bread was upon investigation found to be due to the fact that red oxide of mercury had been used as a paint for stenciling the brand upon the sacks which had contained the flour from which the bread was made. Flour is very absorbent, and in this case it had absorbed the poison through the interstices of the sacks.

"SUNDOWN DOCTORS."—This is the appellation said to be applied in the city of Washington to a class of practitioners who are clerks in the Government offices, and who have taken a medical degree with a view to practicing after the hours of their official work are over.

THE BOARD OF HEALTH is taking vigorous action in the matter of stamping out contagious diseases, but public opinion will support the board in any reasonable precautions for the welfare of the community, which must be placed before all individual interests.

THE great chemical trust in England has been registered as the United States Alkali Company, with a capital of $30,000,000 in $50 shares.

USEFUL INFORMATION.

Letter-Boxes.

The Postoffice Department at Washington recently called for models for a letter-box suitable to place upon either the outside or inside of dwelling-houses for the reception of letters delivered by carriers, and a commission was appointed to receive and pass upon the merits of those received in competition. That commission has met and reported that the number of models submitted to the commission was 387, the number of designs 177, the number of communications containing suggestions 200. Sixty-five exhibitors appeared personally before the commission to explain their models. There were a number of boxes which contained many meritorious points, but all were lacking in some essential requirement, and no one was accepted.

The chief value of the report lies in its suggestions for the future. The essential requirements of a satisfactory box, as outlined by the commission, are as follows:

It should be of small cost.

It should be neat in appearance.

It should protect the contents against rain, sleet, snow and dust.

It should furnish reasonable security against removal of letters by thieves, and against removal of exterior boxes from doors or walls.

It should be as simple as possible in its manner of operation.

The lid of the box should be so hung as to not require the carrier to open it, or to use more than one hand in depositing the mail.

The box should mar the door as little as possible.

The box should have an attachment of some character for the reception of papers.

It should disclose the presence of mail matter without being opened.

A NEW AND VALUABLE KIND OF BRICK.—Another utilization of waste has been announced—the manufacture of a superior quality of brick from the waste sand employed in grinding and polishing plate glass. As is well known, plate glass is ground by means of wooden plates covered with iron, between which quartz sand abundantly moistened with water is brought. By the manipulation of grinding, which consists of a constant moving to and fro of the grinding plate over the plate to be ground, the quartz sand becomes mixed with particles of iron and sand, and after it has lost its sharpness is piled up near the manufactory as worthless material. This sand contains about 15 per cent of glass particles and 2 per cent of iron particles. It is very hygroscopic, and before it can be used for the manufacture of bricks has to be dried, and is then pressed into the mold under a pressure of 660 pounds per 0.155 square inch. The pieces thus obtained are subjected to a temperature of 2732° F. At this high temperature the glass enters into a combination with the sand, a new product with new properties being thereby obtained. The bricks thus produced have a specific gravity of only 1.5; they are perfectly white and are not attacked by acids; and for this reason would be especially desirable for use in factories of chemical products, particularly in factories of sulphuric acid. They also resist frost. Regarding the strength of the material, experiments have shown them to possess a compressive strength of from 340 to 975 pounds per 0.155 square inch. By mixing the sand, enameled bricks showing beautiful colors are obtained, which may be used for decorating fronts and interiors.—*The Brickmaker.*

A NEW INVENTION IN MUSICAL INSTRUMENTS has been brought out in Austria by a manufacturer living at Pressburg, which is causing a good deal of interest. This is called a bowed piano, but is really a case resembling a pianoforte frame and containing six violins, two violas, and two violoncellos, the strings of which are tuned to different notes. The instruments are connected by circular bands, which are brought into contact with the strings by means of the keyboard, the hammers of which bear upon the bands with varying pressure. The instrument is said to produce a fine tone, soft or powerful; but the principal difficulty in bringing it into practical use would be the tuning of the gut strings required, as wire strings could not be universally employed, and it is to be feared it is only likely to be a musical curiosity.

GOLD ABSORBED BY RUBBER.—The burnt rubber used for the final polishing off of the gold lettering, etc., used in finer work in the Government Printing Office, is simply india-rubber, which has been subjected to a peculiar fire process that makes it very spongioee and absorbent. So remarkable is its latter quality that a chuck of it as big as three of a man's fingers will take up more than $15 worth gold in its pores. When, after some months of use, such a piece of burnt rubber is loaded with all the gold that it will comfortably carry, it is sent, with a lot of others in the same condition, to the Mint to be assayed.

It is reported that patents will be soon issued to cover the alloying of aluminum, which will enable that metal to be tempered and to be given a cutting edge.

NEW USE FOR DIAMONDS.—The use of diamonds as sights for firearms has recently been patented in England. The diamonds are fixed in front and back sights, and it is said enable the user to take a quick and correct aim, even in bad light. The brilliants are so fitted that as soon as the piece is brought to the shoulder the rays in the gems assist the alignment, and the eye takes aim without the least hesitation.

SHOP NOTES.

LEARN YOUR TRADE before you offer your services as a journeyman. The Boston *Journal of Commerce* gives the following hints to mechanics: How often we hear the remark made by a blacksmith, or some one who attempts to harden machine tools, that he must first understand his steel or he may fall short of making a success of it. This may be all very true and sounds quite reasonable, but it seems strange to those who have the bills to pay, who think that this "knowing your steel" should not be learned in some other way than by spoiling a piece of work that has had costly labor laid out on it. The same thing is seen in the machine shop, only it is not looked at in the same light. A shop hand frequently remarks, and with good reason, too, when he gets through with a job, that if he were to do the same work over again he could save money by it, or that he has just got the knack of turning off the work easily, and making a saving in time, and still no one has a right to say that this feature should have been a part of his trade long before he came to work and not to have picked it up at the company's expense, for a trade is a growth with lots to learn and little to forget every day. The contractor can take the same thing right home to himself, if he likes; that is, if he has a mind to look at it in that way, for how many times has he found himself in just the condition, when about to complete a contract, that he should have been in when he commenced. Every scheme and method seemed to have proved a failure until along at the close of the undertaking, and then, just as everything gets settled down to good working buss, the contract is finished.

CLEANING MACHINERY.—The simplest and most efficacious method of thoroughly cleaning the various parts of machinery that have become gummed and dirty by the use of fat oils for lubricating purposes is by using a strong soda lye. For each 1000 parts by weight of water, take about 10 or 15 parts by weight of caustic soda or 100 parts ordinary soda. Let the solution boil and enter the parts to be cleaned; either boil them in this lye or let them steep in it for some time. All the dirt and oil resin is completely dissolved thereby, and it remains only to rinse and dry the parts. The action of the lye is such that it enters into combination with the oil and forms soap, which is readily soluble in water. In order to prevent the hardening of the lubricant on the machinery parts, it is only necessary to add about one-third kerosene. An occasional lubricating with kerosene alone is to be recommended.—*American Engineer.*

GOOD WORK in any trade depends on good measuring, but the workman who measures too much is about as unreliable as the man who talks too much. Fine measures in rough work are frequently as much out of place as rough measures in fine work. A useful faculty, and one that every mechanic ought to cultivate, is that of measuring or estimating sizes by the eye. In drilling holes for rough bolts, visual measurement is good enough, if done by an expert, while it frequently happens that a slovenly workman will drill holes much larger than the drill without knowing it, or the reason why, and the former will measure closer by the eye than the latter with rule and calipers. The faculty is acquired and kept up by constant practice, by the aid of a standard of comparison such as a common rule.—*Ex.*

HEATED BEARINGS may arise from a variety of causes, such as (1) Bearings of insufficient area for the pressure or strain put on them. (2) Machines run at short centers with a tight belt. (3) Bad fitting bearing or seamy shaft. (4) Bearings too good a fit or screwed up too tight. (5) Insufficient lubrication, improper or bad oil. (6) Dust or dirt in the bearings, oil grooves too shallow, or oil-ways stopped. (7) Bearings will also stretch and pinch the shaft from being allowed to run slack or get out of line of level. (8) From oil-boxes or lubricators being or becoming air-tight and preventing the proper flow of oil. (9) From the axles of all the journals not being parallel, or from the spindle not bedding surely on the bottom of the bearings. (10) From spindle or pin being sprung or bent.

A SHOP POSTOFFICE.—We saw recently a system used in a large engine and boiler establishment for promoting detail work around the shop which seems worthy of adoption in large railway shops. At the desk of each foreman was a tin box, in which all communications for other departments were put. A messenger was detailed whose duty it was to keep moving from shop to shop, picking up and leaving mail in each of these boxes as he went through, completing the rounds generally within an hour. The result was that many questions were answered inside of that time, thus saving a great deal of time of the foremen and obviating the necessity of their leaving their own particular shop. The results are said to be most gratifying.—*Master Mechanic.*

Passing Events.

On Tuesday night last the drought that with scarcely any interruption had run for a period of seven months was terminated by a copious rainfall, followed by another equally abundant on Wednesday night. As these rains have extended over the whole State, our fears of a dry winter are measurably relieved.

Five new States, North Dakota, South Dakota, Montana, Idaho and Washington, having lately been admitted to the Union, Secretary Tracy has just issued an order increasing the number of stars on the national ensign to 43, corresponding with the 43 States of the Union. Wyoming having still more recently become a State, another star will now require to be added to the number.

Parnell still maintains his place at the head of his party, though it is thought he may ultimately consent to be temporarily retired.

Congress convened on the 1st inst. Promptly the fight on the Election law was resumed in the Senate. The President's message, which as usual was at once set in, is, as a matter of course, approved by one party and condemned by the other.

Owing to the rate the seals have been destroyed during the past few years, threatening their early extermination, there is a chance that England and the United States will come to an arrangement whereby none of these creatures will be killed next year.

On the 3d inst. Cyrne W. Field and his wife of New York celebrated their golden wedding, having been married 50 years.

No outbreak among the Indians is likely to occur, certainly not before the advent of warmer weather, the recent cold snap having chilled the ardor of the "braves" for a fight. There is danger, too, of the "grub" question becoming stringent should they leave the reservations. The Messiah continues to draw his regular rations much after the fashion of the other "Redskins."

A Business that Helps Every Other but Antagonizes None.

Mining for the precious metals, more especially for gold, has its drawbacks and troubles. Like every other pursuit, it is beset with many difficulties and is sometimes attended with disappointment and loss. But there is a class of evils incident to most other kinds of business from which this is wholly exempt. The gold miner has for the product of his mine always a market; not only so, but it markets itself. He does not have to seek a purchaser, nor does he have to employ an agent, assistant or broker. So far as price is concerned, he always deals with first hands. He never has to sell at a discount or allow any commissions; no matter where it is produced or in what form it is placed on the market, whether in the shape of coin, dust or ingots, gold is always at par. The great bars from the Treadwell mill in Arctic Alaska, and the quill-preserved dust gathered by the black woman in far Ethiopia, are worth, ounce for ounce, just the same. The savage and the civilized man alike have an instinctive appreciation of the value of gold, it being the one thing that can be bought and sold without a middleman or an interpreter.

Again, the market for this metal is never overstocked. There is never any glut, produce what we may. The supply never exceeds the demand. As has been aptly observed, "There is ever a dearth of gold." The consumer is a negative factor and need not be consulted. It can safely be assumed that he is ever suffering from a shortage. There may occur a plethora of most other things, but not of this. The oatchers and canners of salmon may take and put up more of these fish than the world cares to eat. The farmers may raise so much wheat that there cannot be found for this cereal a profitable market, and so of innumerable other commodities, but never can there occur a plethora of the most royal metal, the spot and the mart price of which differs not greatly—the value of gold in the city of London and on the West Coast of Africa being nearly the same.

Another pleasant feature about this business of gold mining is the fact that it does not injuriously compete with any other interest, pursuit or calling. It is helpful to all but hurtful to none. This can be said of hardly any other industry or calling. The party who starts another factory, store, cobbler's stall or peanut stand does so to the detriment of some one else; not so the gold miner. He may put up a mill beside that of his neighbor and even on the same ledge, yet no one feels aggrieved because no one is hurt. As gold is the universal medium of exchange and measure of value, so is it the metal of universal good-will.

Generally Hold Their Claims Too High.

The Grass Valley *Union* comments with some severity on the practice, so common among claim-holders, of asking excessive prices for their mines, or rather mineral locations, remarking that such course not only deters capitalists from investing in properties of this kind, but tends to discourage them from even so much as coming or sending agents to look at them, the *Union* advising miners to moderate their demands if they hope to effect sales hereafter.

This is good advice, and claim-owners would everywhere do well to pay attention to it. Comparatively little foreign capital is coming to California just now, nor is much money being put into our mines by home investors. It is the case, too, that parties willing to embark their means in mining are more cautious as well as more exacting in their requirements now than formerly. They will not so much as look at a property of questionable value, nor will they pay extravagant prices for good ones. The field is too large, and there are too many mines on the market for that.

The agents of Eastern and other outside capitalists have to traverse a great extent of mineral-bearing territory before they reach California. Keeping off to the north, they may, without going much out of their way, take in the great metalliferous States of Dakota, Montana, Idaho, Washington and Oregon, or deflecting their course a little to the south, they may pass through Colorado, New Mexico and Arizona, all rich in the precious metals and all swarming with prospectors and miners anxious to sell their claims, willing often to accept almost any price that may be offered for them; some of these countries, in their greater nearness to the Atlantic seaboard and the principal money marts and supply centers, possessing a decided advantage over California.

Then, besides these our neighbors, there are other countries competing with California for capital. Mexico, Central and South America, Africa, India and Australia are all in want of money—all want to sell their mines or obtain means to open, outfit and work them, and are bidding high for it. Labor and capital in most of these countries are cheap—much cheaper than here, the only advantages California possesses over them being her better climate, better machinery, and perhaps also better mines. But these will not avail to secure us purchasers unless we can offer our mines at reasonable figures as compared with those that elsewhere obtain. These are facts that should be borne in mind by such of our claim-holders as wish to dispose of their properties, and cause them to moderate their ideas as regards prices.

Planned for the Home of a Great People.

If ever Nature plans with a purpose of the kind, it was clearly her design that California should become the home of a great nation. Look at her and study her advantages and possibilities in all their aspects and bearings; consider her incomparable climate, her prolific soil, the motive-power of her many rivers and her wealth of forests and mines. Translate these into the language of industry and commerce, and what do they teach? Clearly that California was destined to be the seat of wealth and power—the home of a numerous, rich and prosperous people.

While the Pacific ocean on the west will forever serve as a cheap highway to countries abroad, her great bays and far inland-reaching rivers will remain the channels of domestic trade and traffic. Starting at the seashore and traveling east, we pass over a succession of low mountains and fertile valleys till the foothill region of the Sierra is reached, with the great forest-clad, snow-crowned cordillera beyond. Issuing from these mountains more than 20 large rivers, besides numerous smaller streams, flow west, affording ample means for irrigation and water-power of almost illimitable extent. That the flow of these rivers might not fail when most required for irrigation, Nature took the precaution to pile up every winter enough snow about their sources to keep them well replenished till this need is no longer stringent. Through this wise provision the propulsive power generated by these streams never wholly fails, nor is it ever more than partially abated. As the fall in these rivers varies from 5000 to 10,000 feet, their value for propulsive purposes can hardly be overestimated.

The lack of a good coal has ever been considered an insurmountable obstacle to the establishment of large and successful manufacturing industries in California. But with the immense water-power afforded by so many mountain streams, this difficulty is in large measure overcome, the practicability of transmitting this power to distant points through the electric cable adding largely to its value. Besides the propulsive power derived from this source, both wind and wave power can in this State be made largely available for driving machinery, and that they will in good time be so employed admits of no doubt. What will greatly aid manufacturing in this State is the extent to which we produce the raw material in almost every required form. In this respect no country in the world is richer than California.

But a good country is but half of a great nation, and the poorer half at that. It is their character rather than their possessions that makes a people truly great. And who can tell us what manner of man is this who is coming to inhabit California? We have here assumed that he would be worthy the country he is to occupy; but about this opinions differ. The best countries do not always produce the best races of men, and possibly California may not prove an exception. Our predecessors here were not much to boast of, nor have we as yet made ourselves conspicuous by our intelligence or our virtues. Occupying the best country in the world, we have shown ourselves neither better nor worse than the average of mankind.

The President's Message.

Congress convened on Monday, when the President's message was read and heralded through the press to all parts of the United States. For a short session the message is much longer than the average, but this can be overlooked when it is considered that he must devote considerable space to the important subjects under debate at the last Congressional election.

Taken as a whole, the message contains much to commend; but like all annual messages to Congress it contains weak points open to attacks from the opposition, but it is this divergence of opinion that makes a politician's life endurable, and which is also calculated to keep each party on the alert for the best interest of the country.

The most interesting features in the message can be briefly stated as follows: Approving reference is made to the Pan-American conference, which marks an epoch in the history of the Western Hemisphere. The President surprised (probably agreeably so, too,) the country by disavowing the action of Mizner, Minister to Guatemala, in the Barrundia case, and the Minister has been recalled. In briefly referring to China, he states that he has made a proposition to the Governments of Mexico and Great Britain to consider a conventional regulation of the passage of Chinese laborers across our southern and northern boundaries. On the silver question he fails to recommend free coinage, but says that "it having been thought best to renew formally the suggestion of an international conference looking to an agreement touching the full use of silver for coinage at a uniform ratio, care has been taken to observe closely any change in the situation abroad, and no favorable opportunity will be lost to promote a result which it is confidently believed would confer very large benefits upon the commerce of the world. The recent monetary disturbances in England are not unlikely to suggest a re-examination of opinions upon this subject."

The receipts of the Government for the fiscal year are given at $163,963,080.85, and the expenditures at $358,618,584.52. The recommendation of the Attorney-General that greater care be taken in the examination of applicants for citizenship is indorsed, as is the recommendation that pool-selling in the District of Columbia be prohibited. The Behring-sea difficulties have not been adjusted. The Pension Disability Act has not entailed a greater outlay than was expected. The beet-sugar industry is declared to have passed the stages of experiment and may be regarded as a complete success.

The President predicts that recent legislation will quicken and enlarge the manufacturing interests, increase markets for farm products and cause general prosperity, and he shows that there has been a general improvement in trade and industry during the year; that the number and extent of business failures have decreased; that business, as shown by Clearing-house returns, has increased; that prices of agricultural products have advanced to a marked extent, and that labor troubles have diminished.

The President discusses at some length the McKinley tariff, and deprecates the idea of subjecting the Act to important changes until it has been fairly tried. Reciprocity receives a large share of favorable attention.

The President's reference to the water question possesses peculiar interest to this coast. He says that "the owner of the water is the owner of the lands, however the titles may run,

All nnappropriated water sources and all necessary reservoirs should be held by the Government for eqnal nse at fair rates." He snggests that the Government should take charge of the watersheds.

The message ends with recommendations to Congress for tha passage of apportionment and appropriation bills. For the encouragement of American steamship lines connecting domestic and foreign ports, an especial plea is made for tha Oceanic Steamship Company of San Francisco, whose steamers ply between San Francisco and Australia, and which may he driven nut of the business nnless the United States comes to the rescne. The President calls attention to tha danger of a rival subsidized line from British Colnmbia.

For the incorporation of an international American bank to fecilitate business with the other American nations.

For an increase in the salaries of United States Judges to $5000 a year.

For the settlement of Mexican and Spanish land grants.

For the passage of a national hankrnpt law.

For an international copyright law.

For the passage of a law compelling railroads to nse couplers and brakes on freight trains.

For the passage of lawe reserving all water rights and reservoir sites in the arid regions for public nse.

For the passage of laws to enable the Post-office department to contract with the telegraph oompanies to eetshlish a postal telegraph system.

Fnr the passage of lawa for preserving the purity of the election, and a speoial reoommendntion for the passege of a hill similar to that known as the "Force" hill during the last session of Congress.

List of U. S. Patents for Paoific Coast Inventors.

Rsportsd by Dawey & Co., Pionsar Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 25, 1890.

441,533. — STOP-BLOCK FOR WAGONS—J. W. Carter, Tacoma, Wash.

441,145.—VISE PIPE-TONGS—John Ellis, Stockton, Cal.

441,154.—HARROW—J. T. Grant, San Jose, Cal.

441,414.—WHEEL CULTIVATOR — D. F. Hunt, Elherton, Wash.

441,419.—FERMENTING-TANK WINE-STRAINER —J. C. Jones, Napa, Cal.

441,584.—PROTECTING PILES—F. Rives, Seattle, Wasb.

441,334.—SPEED INDICATOR — F. N. Scofield, Phœoix, A. T.

441,382.—CULTIVATOR — Robert Simpson, Hanford, Cal.

441,598.—SUSPENSION BRIDGE—G. W. & F. P. Stedman, S. F.

441,449. — WAVE-POWER MOTOR—E. D. Stodder, S. F.

20,350.—DESIGN—E. Shepperd, S. F.

The following brief llet by telegraph, for Dec. 2, will appear more complete on recsipt of mail advices:

California — Albert J. Armetrong, Coronado, boot calk; Hane C. Bebr, San Francieco, cruehing roll; George H. Clark, Sacramento, burial apparatue; Greenwood Fry, Cottagsville, Ky., assignor of one-half to H. M. Crawford, Los Angeles, corn-planter; Lamartine E. Fulda, assignor of one-half to E. Fulda, San Francieco, hoop coupling; Wendell P. Hammon, Oakland, and C. J. Sechrist, San Francisco, fruit-drying tray; Herbert S. Herrick, San Francisco, dose-measuring bottle; Andrew McClain, San Diego, fumigator; Samuel A. Owen, West Berkeley, propulelon of vessels; James Patteroon, Stookton, and W. Patteroon, Benicia, steam boiler; Florian Stanke, San Francisco, fruit-gatherer; William S. Van Sant and E. E. Eamee, Dixon, coin actuated liquid-vending machine.

NOTE.—Copiee of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the ehortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EXERCISING DEVICE FOR MUSICIANS.—Eugene S. Bonelli, S. F. No. 440,837. Dated Nov. 18, 1890. This device is for exercising the muscles of the fingers, hand and wrist, and belongs to that class in which a pivoted spring-controlled lever having a finger-strap, to receive one finger, is used in connection with a bridge on which the other fingers rest. The object of the invention is to provide a readily portable machine capable of exercising all the muscles necessarily used by musicians. Its novelty consists in various details of construction, as, for example, in the changeable springs by which the lever is affected from above or below the finger loops, the adjustability of the bridge above or below the lever, the wrist attachment and other features.

COMPOSITION FOR PROTECTING PILES.—James Rowe, S. F. No. 440,832. Dated Nov. 18, 1890. This composition belongs to that class of pile protectors which consists of suitable compositions of matter applied to the exterior of the pile and forming a coating therefor which is intended to resist not only the action of the water, but especially the ravages of marine insects, particularly the teredo. It consists of an inner covering and an outer coating. The inner covering is made up of such ingredients as tar, asphalt, etc., together with a resistant and a poison. The outer coating is one which will harden and set to protect the inner covering.

CULTIVATOR.—Robert Simpson, Hanford, Cal. No. 441,382. Dated Nov. 25, 1890. The novelty in this cultivator consists in connection with a wheel shaft and suspended toothed-frame of rigid pole and guides and supports for holding the frame in place, and preventing it from swinging from side to side, and for raising and depressing it. The cultivator is prevented from swaying outside the line of the wheels, and it can be easily guided to avoid a root or tree. It may be raised to avoid anything and can be held at any desired depth in the ground. The draft is brought directly upon the pole, and the axle is relieved from this strain.

FERMENTING-TANK WINE-STRAINER.—John C. Jones, Napa, Cal. No. 441,419. Dated Nov. 25, 1890. This device is to be used in connection with the discharge of wine from the tanks in which it is fermented. It consists of a removable strainer and means for clearing it while in position. Within the tank are vertical channeled guides on each side of the discharge opening and extending to the top of the tank; in these guides is fitted a vertically movable box, and upon the interior of the box are adjustable rods forming a screen; a transverse bar travels upon the outer rods as guides, said bar having tongues which project between the intermediate rods, and a rod is arranged to reciprocate the transverse bar.

The Gold Belt of California.

NUMBER IV.

Tha Anciant Placers and Their Relation to Wall Rocks.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON, Kernville, Cal.]

The occurrence of these heavy nuggets of gold in snch close proximity, while no such nnggets were fonnd elsewhere in that section, together with the oconrrence of nuggets of equal size in the original matrix in the same belt and formation, is sufficient proof that they were born olose at hand. To the east the mountains stood high above the ancient channel, and explorations failed to locate a vainable mine there, from whioh these nuggets oonld have been carried. To the northeast the lime belt curves up the South Fork of Stanislaus and appears still farther east on the north hinff of the North Fork of that streem. The region between the forks of this stream has been neglected for want of water, and still it was over this region that the ancient gravel passed which covered the region around Colnmbia. For a nnmber of miles the track of this current was over alternations of lime and soft slate, with an occasional showing of coarae porphyry and greenstone. If these nuggets did not pass over the region between the forks of the Stanislaus, then they came from lodes sitnated at the head of Three Pine Gulch. Until very recently there wes no disposition to look for a quartz lode in that locality, and still the cnrrents whioh once swept over there deposited millions of dollars along their track. I will allow that this ancient cnrrent was of great force and volume. On the sonth of Gold Hill, west of Colnmbia, ie a block of quartz five feet in diameter reposing on a lime formation, and brought there hy the current which deposited the gravel of the ancient placers. Bnt admitting the force of the current, no reason can be assigned why still heavier matter shonld not have lodged farther up the stream, and hence we conclude that these large nuggets remained near the original matrix. If they were all carried acroes the region now occnpied by the gorge of the Stanislaus, then many of them should have been left to be carried down alcng the hed of that stream. On the other hand, the coarse gold of the Stanislaus was mainly limited to the Pine Log Bar, and almost certainly came into the streem there from the sonth. Pine Log is 1300 feet below the level of Columbia, and if this gold was born of the contact between intervening formations of lime and elate, there must be a mint of it left; but if it wae erupted there, then the chance for drainage would offer an opportunity to etrike the main hody nearer Pluto'e dominione.

During the last summer, ae agent of mining etatistics for the 11th cenens, I had frequent occasion to notice the tranaitory nature of quartz lodee in granite. Some minee I noticed where a film of gold and a thin sheet of kaolin olay eerved ae an excuse for a lode. In many cases the width of the lode varied from a half-inch to six inohes, All theee lodee are shallow and richest near the surface. The Joe Walker mine at Walker'e Basin, Kern county, offers one inetance which hae come under my obeervation where rich rock was followed down between granite walle to a depth of 290 feet, hut the couree of thie lode is diagonally toward the contact of elete and lime to the northeaet and but a ehort distanoe away. Most of the Havilah minee are eimilarly located, except that the main lode, of which most of the others are epure in the westward, ie looated parallel to and in oloee proximity to the lime contact farther east. While thie latter lode carries moet of the gold of that district, it hae not been worked because it ie not free-milling ore; that ie to say, that the gold ie eo intricately combined with other metale and eubstances that it paeeee the skill of the ordinary miner to eeparate it. The miner and the capitaliet will condemn euch ore as worthless and paes it by; hut to the eclentiet it presents the question of its recondite history. After five minutes devoted to figuree he diecovere that this oharacter of formation contains more than a molety of the preoious metale of the State; that with them are oombined nearly all the useful metals, nearly all the refractory oree. The dawn of theee truthe upon his imagination awakens a new interest in these vast ore depoeits, and hie thought ie ae to how to extract the preolous metale without destroying the useful onee.

There are aeveral streams in California whioh have not yielded placer gold. On the heade of theee streams the metal-hearing lodes contain gold in such oloss chemical combination with lead, zinc, antimony, tellurium, selenium, vanadium and many other snbstances, that it requires a careful assay to determina its presence. This fact explains why no gold was dng in cartain districts on the western slope of the Sierra Nevada mountains. It has also dona much to obscure the true geology of gold. It has no nobler linsage then the other matals. It was born of the same causes; and if we reckon the refractory ores, the great hulk of it is combined in the seme matrix. In some instances and in certain localities, oxygen has carried away its associatee, and has left the pure metal for scientists to ascribe a volcanic origin to. On a line running to the east of south from Mono lake, through the heart of the Sierra Nevada mountains, crossing the heads of the San Joaquin, Kings river, the Kaweah, and thence down Kern river and to the Mohave desert, there is a formation which is indeed rich in its refractory ores. I am not aware that any of the ancient channels covered any of this region, hut from the summit of the Sierrae I see a white mountain to the east of Tehachipi and to the north of Mohave, which closely resembles the lava-capped hills minus the lava; and I am told it is composed of porcelain cley. I am strongly inclined to the opinion that it covers an ancient gravel deposit, and shell try to satisfy myself on that point some day. This line of refractory ores has a great similarity throughout, and will afford food for the reflection of the meteilnrgiet of coming generatione.

(To be Continued.)

Why the Rains Were Late.

The Signal Service weather report for November has just been issued. In it Lieutenant Finley of the Signal Corps, in charge of the Division of the Pacific, says:

"The most remarkable feature of the weather for tho month ie the extraordinary deficiency of rainfall. It ie a deficiency which affects the entire Pacific Coast from Mexico to British Colnmbia. The proximate oause for this deficiency is found in the high latitnde of the easterly movement of cyclonic areas from the Pacific ocean. In spite of the fact thet there were a large number of these arees, only one of them passed south of the northern bonndery of the United States. This area gave rise to a peculiar secondary cyclonic effect which passed sonthward into Nevada and gave rise to the sndden and rather heavy rains in Western Arizona and Southern Californie. This secondary area was forced southward by the rapid formation of a high berometer in Washington and Oregon. A weather record for San Francisco, embracing a period of 42 years, shows that never before within that time has the month of November been so deficient in rainfall. The emallest amounte previously recorded are 0.15 of an inoh in 1862; 0.25 in 1876, and 0.26 in 1884.

"A chart with the storm track for November, 1884, shows hut three cyclonic areas, two of which passed eastward north of Washington and the third through the northern portion of that State. This slight deflection to the sonthward of one of those areas was sufficient to give California a few light showere. The cyclonic areas for November, 1890, have been peculiar not only for their high latitude but also for their rapidity of movement, which has tended to increaee their nnmber, which is unusually large for the month. This rapidity of movement aleo explaine the large number of deye on which light showere fell in Washington and Oregon (nearly two-thirde of the month) and the small total of precipitation. The conditione for rainfall were no sooner formed than a change in the cyclonic oirculation drove them away. It is not within the province of thie review to discuss the qnestion as to the cense of the extreme northerly movement of the cyclonic areae for this month.

"Rainfall—It is everywhere deficient, and the amonnt of each deficiency varies from .06 of an inch at Keeler to 6.15 inches at Olympia. The deficiency increasee in amount from south to north, and is especially remarkable north of the 38th perellel. Rain fell on the following dates: Washington—5th to 11th, 13th, 14th, 17th, 18th, 22d to 24th, 26th to 28th. Oregon —5th to 8th, 11th, 22d to 27th. California—5th to 7th, 22d to 25th. Nevada—6th, 9th. Arizona—6th to 8th. The heaviest rainfalls in 24 hours were .66 of an inch at Fort Canby on the 8th and .56 of an inch at San Diego on the 7th. A fall of 2.65 inchee was reported from Globe, A. T., on the 8th. The heaviest monthly rainfalle were .70 of an inch at San Diego and Olympia. The following stations report no rainfall: Walla Walla, Winnemncca, Red Bluff, Sacramento and San Francisco. Snow ie reported as followe: Washington (6th), Whitman county. Oregon (6th), Herney county. California (5th), Pinmas, Ynba and Sierra countiee, 2 to 24 inohes; (6th), Ventnra county. Nevada (6th, 9th). Arizona (8th), on Pinal mountains.

"Local etorme—Hailstorm at Beiotta, Cal., 8th; thunder-etorm at Quincy, Cal., 5th. High 'northere' occurred in California on the 11th and 12th during the prevalence of an area of extremely high barometer in Northern Nevada, Idaho and Oregon. The barometer during thie time wae from .40 to .60 of an inoh above the normal. In eome placee the wind wae reported ae reaching a velocity of over 60 miles per honr, causing damage to fencee, trees and roofe of buildinge. Floode were reported from Western Arizona on the 8th, causing high water in the Gila and Colorado rivers.

"Temperature—it has been above the normal in all districts. The excess ranges from 3 degrees at Olympia to 12 degrees at Los Angeles. The highest temperatnre, 96 degrees, occnrrad at Los Angeles on the 3d; the lowest, 10 degrees, occurred at Winnemucca on the 13th."

An Address on the Weather.

Lieutenant John P. Finley gave a detailed explanation of "Cyolonio Development and Preoipitation upon the Pacific Coast" before the Academy of Sciences Monday evening.

"In a mountainous country," said he, "weather conditione are localized. North of the 30th parallel we look to the west for the coming of storms. All storms which enter this country come from the Alentian islands, or the region adjacent to Japan, the great breeding-ground of storms.

"The precipitation depends upon the parallel along which the storm moves. The rainfall dnring October, 1889, was the greatest for that month in this city dnring a period of 42 years, and the reeson for it was the lower easterly movement of the storm. As a rule, storms strike Alaska on the Washington coast first, bnt in this instance they struck the northern part of California directly. This may have been due to an area of high barometer to the north, which caused the storm to deflect more to the south than usual.

"This year for the first time in 42 years no precipitation has been recorded in San Francisco dnring November, hnt the signal charts ehow that there hae been no lack of cyolonic movement, as 10 etorms were recorded during the month. They, however, all passed along unnaturally high latitndee. They moved very rapidly, and there was no time for a storm to grow to the sonth.

"The summer storms in Southern Nevada, Western Arizona and Southwestern California were due to the melting of the huge masses of snow in the mountains, which encharged the air with moisture at the same time that a cold wave passed along the eastern slope of the Sierra and condensed the clonds into rain.

"All cyolonic movements are divided into qnadrants. The southeast qnadrant is nearest the food snpply, that is, the moisture, and hence it is from thie section that rain comes. The northeast qnedrant develops the greatest cloudiness, with some rainfall. The northwest qnadrant is the coldeet and driest, while the sonthwest qnadrant, on its western side, partakes of the nature of the northwest qnedrant and on its southern side of the sontheastern one.

"With signal stations on the Alaskan ocast and the Aleutian islands and telegraphic communication, we should he enabled to forewarn every storm and approximate its course.

"It is not alone the Pacific Coast that is influenced by the cyclonic movement from the west. The storm, shorn of its moisture, it may he, keeps on eastward, when it again becomes surcharged with moisture, which is precipitated in the great interior valley and on the Atlantic seahoard. Its breeding-gronnd then becomes the Gulf of Mexico, and the air currente generated hy it produce the hurricenes and destructive tornadoes in the region east of the Rocky mountains.

"The theory of cycles seems more a theory than a fact. I have experimented with the etetistics for many years, and I find that you can place no dependence in a recurrence of wet and dry eeasone at regular intervals."

TIMBER FORESTS GOING FAST.—The rate at which the timber foreste of .thie ocuntry are becoming exhensted is eomething that people in general have no proper idea of, saye the *Ohio Valley Manufacturer*, and it ie evident that if a subetitute for timber for furnitnre and buildinge ie not prodnced, there will eoon be serione consequencee. From a recent authentic statement it appears that the amount of timber converted into lumber in Michigan, Wisconsin and Minnesota lest year reached the enormone aggregate of 8,305,833,277 euperficial feet, exclusive of white pine ehinglee, which, if added, would bring the total conenmption up to 9,000,000,000 feet. It is asserted ae a matter of fact that the timber lande of the Northwest are practically exhanated. Of 20,000,000,000 feet reported hy the censue of 1880 ae then etanding in Lower Michigan, only one-tenth now remaine, and in the three States there is eetimated to he lees than 10,000,000,000 feet.

A GREAT COUNTRY AND ITS INSTITUTIONS.—Wonderful during the paet few yeers has been the progrese of the Great Northwest, thie expansion and growth having been more aptly exemplified in the history of Washington than in any other eection of that vaet region. That State is full of establishments and inetitutions such ae we look for only in old and long-settled countriee. Among inetitutions of thie kind ie that known ae Everette'e Mining Office in Tacoma, whereat the sampling and aesaying of ores and eimilar work is done in a manner not eleewhere enrpassed. At this piece full and reliable information about the mines, oree and mineral deposite of the whole Northwest oan also be obteined. For further information in regard to thie model establishment, see advertieement in another column of thie paper.

THE regnlar quarterly meeting of the members of the Mechanics' Institute will be held at the Library, 31 Poet street, on Saturday evening, Dec. 6, 1890, at 8 o'clock.

ROSE'S MECHANICAL DRAWING

SELF-TAUGHT.

Fourth Edition, Thoroughly Revised and Corrected.

JUST READY.

Mechanical Drawing Self-Taught; Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing; together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions Engines and Boilers. By Josbua Rose, M. E. Illustrated by 330 engravings. Fourth edition thoroughly revised and corrected. 8vo. Price.....$4.00

BY THE SAME AUTHOR:

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office; giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo, 439 pages. Price.....$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings 12mo. Price.....$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....$2.50

☞ *Illustrated Circulars, giving the full tables of contents of all the above works, sent free to any one who will apply.*

☞ *The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.*

☞ *Our new revised Descriptive Catalogue of Practical and Scientific Books, 36 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.*

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
231 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

THE RUSSELL PROCESS.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

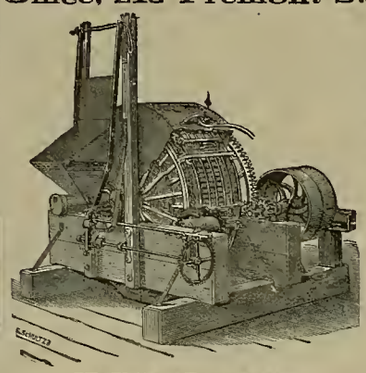
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

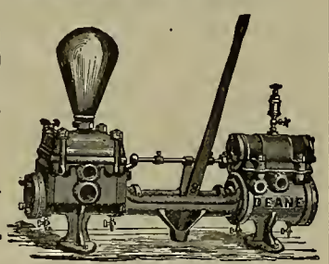
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.



SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers. DEANE STEAM PUMP.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

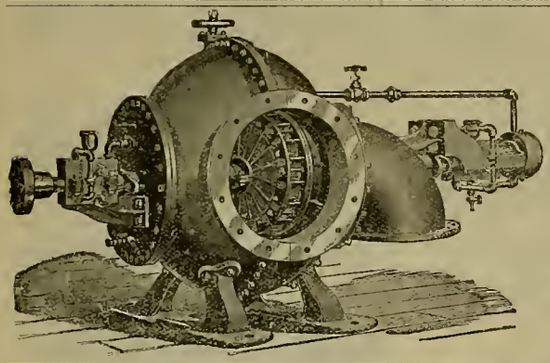
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 4, 1890.

General trade the past week was quiet, but not more so than obtains at this season of the year. Rains the past week have imparted a more cheerful spirit to trade, for they insure more active outdoor work on the farms and also inspire the belief that without some unforeseen event the crops, particularly that of wheat, next year will be among the largest on record. Heavy snowfalls on the mountain ranges assure a bountiful supply of water next year for mining purposes. The foundation is well laid for a very prosperous year in 1891.

The local money market is easier than it was in December, 1889, and this, too, in the face of so much money sent East last month. Now that this money is being returned, still greater ease in the money market is looked for. The large sums to be paid for taxes, in dividends and for interest have been engaged, so that the stringency from these sources is discounted. Those in position to know, unhesitatingly affirm that we will have an easier money market the forepart of 1891 than ever before known.

MEXICAN DOLLARS—The market the past week was quiet but firm. The demand for China is not as large as in former seasons; one cause of this is the more favorable position for remitters of the exchange market. Quotations of Mexican dollars range from 82½@83cts.

SILVER—Offerings, purchases and prices paid so far this month are as follows:

Date.	Offered ounces.	Purchased ounces.	Price paid per ounce.
December 1....	891,000	506,000	$1.0675 to $ 1 075
December 3....	.....	321,000	1.0545 to 1.0595

No sooner did Congress convene on last Monday than several free-coinage bills were brought out. So far as we can judge from the brief telegraphic reports of the bills, that of Senator Plumb commends itself as the best adapted to the requirements of the country. Yesterday a bill was introduced in the House by Taylor of Illinois requiring the Treasury to purchase the 13,000,000 ounces of foreign silver in this country, after which confine all purchases to domestic silver. The action of the Senate in springing political issues or bills (the election-force bills and similar measures) creates uneasiness among silver advocates that the time will be frittered away until it will be too late to pass a silver bill or any other bill looking to the relief of the country. In this city considerable silver is said to have been sold this week at prices ranging from $1.07 an ounce at the opening down to $1.06 at the close.

In this city the Mint's counter rate was on Tuesday, $1.07 an ounce, on Wednesday, $1.06, and today, $1.05¾.

QUICKSILVER—Receipts the past week aggregate 484 flasks. The market is easy at unchanged quotations. Heavy snowfalls the past week in the mountain ranges assure an active mining season next year, and consequently a liberal demand for quicksilver.

LIME—Receipts the past week aggregate 4578 bbls. The demand continues free at current quotations.

LEAD—The market is a shade weaker in sympathy with lower prices at the East. Close money markets at the East and the closing month of the year are against sellers.

TIN—The market continues dull. So far as we can learn, holders are firm in their views for plate. New York and English advices report the market easier for pig, with concessions obtainable.

COPPER—English advices report a fluctuating market, caused more by the money market than from any other cause. The visible supply continues to decrease. New York advices report that outside parcels of copper are obtainable at less than quoted rates, but the Lake companies are firm at 17. It looks as if after the turn of the year the market at the East will do better.

IRON—The market is essentially unchanged.

COAL—Imports the past week aggregate as follows: Seattle, 7848 tons; Departure Bay, 800; Coos Bay, 1800; Newcastle, 3054; Nanaimo, 2390; Comox, 4200. Total, 20,292 tons. The market appears to have an easier tone. The price of Coos Bay is reduced $2 a ton. The imports in this month of coast coals are expected to be quite large. The tonnage on the way to and loading for this port is as follows: Newcastle, N. S. W., 46,048; Sydney, 5565. There are large quantities of coal on the way from English ports. Rains the past two days have caused a freer consumption, which if followed by cold weather will enlarge the consumption still more. If this does happen, prices, it is said, will not be any lower this year.

Eastern Metal Markets.

By Telegraph.

NEW YORK, December 3.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	.....	.....	.....	.....	.....
Friday.....	48¾	1 05	$15 50	$4 80	$20 35
Saturday....	48¾	1 06	16 50	4 80	20 80
Monday.....	48¾	1 06¾	16 50	4 70	20 70
Tuesday.....	48½	1 00	16 50	4 57½	20 65
Wednesday....		1 05½	16 50	4 60	20 60

NEW YORK, December 2.—Quicksilver is no better, 75@ 76c Copper still neglected, 18@15½c. Recent quotations for lake do not cover much volume of business, being held at 17c. Under grade, quiet; Arizona, 14¾@15½c; casting, 14@14½c. Pig Lead, light demand. Spot, $4.75; future, $4.60@4.65.

Coal and Coke.

Mining Share Market.

It is well that the average bull operator gave thanks on Nov. 27th, for since then the market has been on the down grade, with a decided setback in the middle shares under a break in Potosi and lower prices in the Gold Hill shares under a break in Crown Point. The fall in Potosi we indicated in our issue of Nov. 15th. It was engineered by the bears under a report of the drifts on the 1230-foot level getting into old works. The decline in Crown Point was due to an assessment of 50 cents a share. In last June we stated that when the Potosi winze was sunk to the 1230-foot level, connection would be made with the drifts from the Ward shaft and also the old works on the north side. These connections, we stated, would be made to give better ventilation so that prospecting work could be better done on the various levels in Potosi and Bullion. This connection is of quite an important character for the middle mines, although it has been used by the bears to break the market.

The street is full of bear rumors that prices will go still lower—no stock to sell at over $3 a share. These reports, it is claimed, are put out by a ring that is trying to buy stocks so as to keep control of certain mines they have always secured through proxies, but which it is likely they will not be able to do again. It looks as if some of the leading members of the mill ring are helping the stock pool to break the market so as to buy stock. There can be no doubt but leading stocks have been for many months past drifting into strong hands, and the more the above two pools tried to get them back by stealing deals and lowering prices through assessments, delayed work and keeping back information from the mines, the more stocks they lost. It is very generally claimed by close observers of the situation, that in their desperation more assessments will be levied and no ore be shown up until some of the mines change hands. Holders of stocks must be prepared for this. It is an interesting fight, and highly important developments in the stock market are liable to be made either before or soon after the turn of the year. The market, when the fight is well under way, will probably have sharp ups and downs, which are liable to catch many outsiders who buy on a margin and also those who short the market.

It looks as if the depression in the stock market, which has continued for over four months, is about at an end, and the person who buys any of the cheaper stocks and pays cash will not take any risk of a good round profit before long. Within the past week large lines of margin stocks were thrown on the market.

The market opened this (Thursday) morning steady. After Call prices advanced, but toward noon they began to set off again. The points are out for slightly lower prices, then a more active bull campaign.

The Kentuck Mining Co. has called a special meeting to increase the original number of shares to 105,000 with a par valuation of $10,500,000.

From the Comstock mines our advices report a more cheerful feeling than at any time this year. This feeling is based on the nature of the work going on, which precludes the mill ring from keeping important work and strikes from being known. Important prospecting work was started the past week in Savage, which will show good result soon, provided the management does not suppress it. A change in the management of one or more of the mines is among the certainties in the near future outside of Gould and Curry and Best and Belcher which are liable to pass into other hands at the annual elections to be held in this month. From the outside mines the news is of a more important character. In the Quijotoa district powerful drills are being used with good result. In the Tuscarora district the downward continuation of ore in the Belle Isle has been struck on the 450-foot level. It is said to be rich and wide. From several of the other mines good news comes to hand. In Bodie very active prospecting work is going on, with the most sanguine expectations entertained by the better-informed that a very rich strike is among the possibilities of the near future. The mill is running on tailings. From Mono and Bulwer the news is of a prospecting character. The latter company is to levy a 25-cent assessment at an early day.

Assessment Notices.

LEIGH GRAVEL MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Echo Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of November, 1890, an assessment, No. 2, of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary at the office of the Company, 320 Sansome Street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 24th day of January, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. E. FALL, Secretary,
Office, 320 Sansome Street, Room 57, San Francisco, California.

DELINQUENT SALE NOTICE.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 20) levied on the 20th day of October, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Buffington, J M, Trustee	528	2,000	$120 00
Barrows, A W, Trustee	547	1,000	60 00
Bowers, D	379	20	1 20
" "	404	500	30 00
Bogart, C H, Trustee	488	105	6 30
Carnee, W A	252	416	24 96
Francie, H L, Trustee	444	1,500	90 00
Nash, H W	269	104	6 24
Nordman, Leon	514	100	6 00
Roseknans, H M	39	600	36 00
Stout, C S, Trustee	476	2,000	120 00
" "	477	953	57 18
Searles, W A, Trustee	518	1,000	60 00
Steteon, A M, Trustee	520	5,000	300 00
Taylor, J N, Trustee	532	1,040	62 40

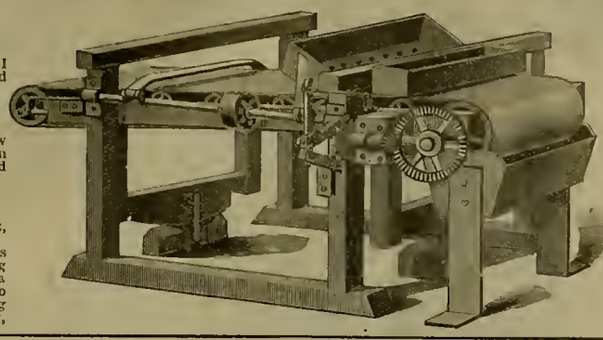
And in accordance with law, and an order of the Board of Directors, made on the 20th day of October, 1890, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 11, No. 303 California street, San Francisco, California, on MONDAY, the 15th day of December, 1890, at the hour of one (1) o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

A. W. BARROWS, Secretary pro tem.
Office, Room 11, No. 303 California street, San Francisco, California.

SITUATION WANTED—MINING ENGINEER, eleven years' practical experience in smelting and milling, six years as Manager and Superintendent, desires employment. Just returned from Central America. Highest testimonials and references. Speaks Spanish fluently. Address, GRINGO, Box A, this office.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented October 8, 1889, and December, 1890.



ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD, Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6th, 1890.
MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., Nov. 22, 1890.
JAMES TULLOCK, Esq.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours, T. M. LANE.
Supt. Madison Mine.

Price, $350, delivered at Factory, Angels, Calaveras Co., or at Milton railroad station free of charge. For further particulars, address

JAMES TULLOCK, Angels, Cal.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

Educational.

Testing and Working Silver Ores

A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat, of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, sorecns, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, $2.00. Sold by DEWEY & Co., Publishers, 220 Market St.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.

MACHINERY!

SECOND-HAND, FOR SALE. IRON PLANER, DRILL Press, Lathes, Wood-working Machinery, Belting, etc. I. A. HEALD, 108 Main Street, San Francisco.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MFG CO., 9 Nassau Street, Rockford, Illinois.

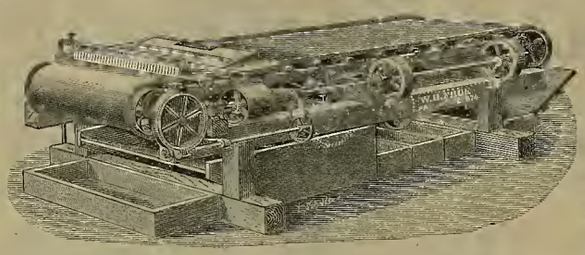
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

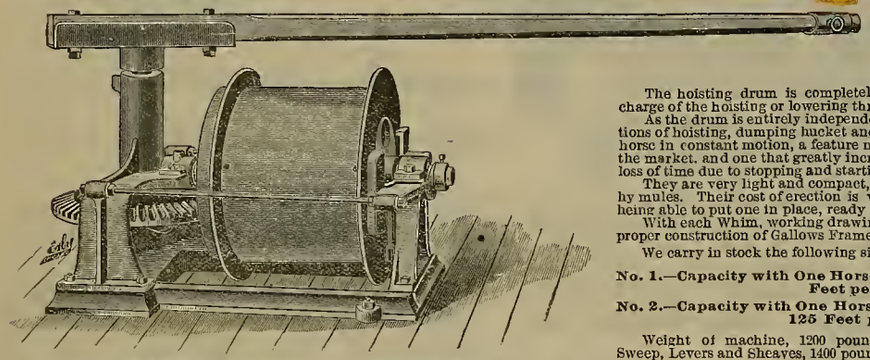
There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vannere in a competitive trial with other similar machinee (Triumph), we have satisfied ourselvee of the superiority of your Vannere, ae ie evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such eatiefaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"Sensible" Horse Pow[illegible] Hoisting Whims.



These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market, and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

Gold Mining and Milling in Korea.

Gold mining in all its branches is conducted with very primitive methods and appliances in the Peninsula of Korea, this industry being there in a still more backward state than in China, to which that country is tributary. Mr. Willard I. Pierce gives, in a paper read before the American Institute of Mining Engineers, the following account of the manner in which the business is carried on in the Kingdom of Korea:

In mining where the rock is hard, wood is piled up near the face of the tunnel or drift and then set on fire. The fire burns for 24 hours, after which, three or four days are given for the rocks to cool, before the miners go in and extract the loosened material. The only tools in use are a hammer, a steel gad about five inches long, and a flat spoon-shaped basket. The pay-streak or chute is closely followed, and in places the workings are very small and intricate. Rock not yielding more than $6 per ton is not extracted. The manner of opening a mine is to begin on the outcrop, where the rock pays, sink a shaft or run a tunnel on the vein, and follow the pay-streak and more easily worked ore. When this is exhausted, or the influx of water interferes, the opening is abandoned and operations are begun again at a new spot on the outcrop. The place usually selected is as high up on the mountain as possible, and in no instance is advantage taken of the topography by running a cross-tunnel to tap the vein.

The ore is brought in baskets to the surface, and there placed in sacks, holding about 150 lbs. each, and taken to be crushed. The rock is first crushed between two stones, as shown in the cut here given. The upper stone is oval and rounded on the bottom, so that it can be readily rocked on the under stone. Two pieces of wood, used for handles, are placed one on each side, in grooves in the upper stone, and held in position by means of straw rope. The lower stone is not smooth on top, but exhibits three elevations running lengthwise, with shallow depressions between them. The middle elevation acts as a fulcrum on which the upper stone may be rocked. From two to ten men, according to the weight and size of the stone used, are employed in rocking. With four men, from 300 to 350 pounds of rock can be crushed per day, the stone making 50 complete oscillations per minute. The men squat on each side of the stone and move it to and fro by means of the wooden handles. The ore is fed in pieces up to the size of an egg, or even larger, by one of the men. During the crushing one man on each side, as the stone rocks from him, uses a stick as a scraper to stir the crushed rock. When the ore is fine enough, it is swept out on a piece of cloth, placed at one side of the stone, the rocking being continued all the time. After a certain amount has been crushed, it is usually put through a horse-hair sieve and the coarser portion is treated again.

KOREAN GOLD-MILL.

An upper stone, intended for four men, measured 23 inches in length, 20 inches in width at the base and 15 inches in hight. Crushing is usually performed in sheds to prevent the wind from blowing any of the fine stuff away.

The crushed ore is taken to men who rub it between stones until it is very fine; the rubbing is generally done wet. The powdered ore is received by other workmen, who pan it and save the free gold. The pan is of one piece of wood, 20 inches in diameter and 5 inches high, and the men who use this instrument are the most expert panners I have ever seen. The pan is not held in the hands, but floats on the surface of the water, one side only being raised or lowered to agitate the contents. As the pulp is very fine, and the gold in the same condition, the top of the water in the pan is frequently sprayed, so as to settle any gold that may be floating. The first tailings are washed off directly from the right-hand side of the pan. After this, the sulphurets and gold are collected on the right-hand side of the pan, and the tailings on top of the sulphurets are, by a few skillful movements, washed over to the left-hand side. The pan is then half revolved, and the tailings are washed off from the right-hand side. The same operation is repeated after the tailings have all been removed with the sulphurets and gold, the former being saved and again rubbed. No quicksilver is used; but I do not think that there is any loss in free gold.

Fig. 1—CUT SHOWING LEAD CYLINDERS BEFORE AND AFTER EXPLOSION.

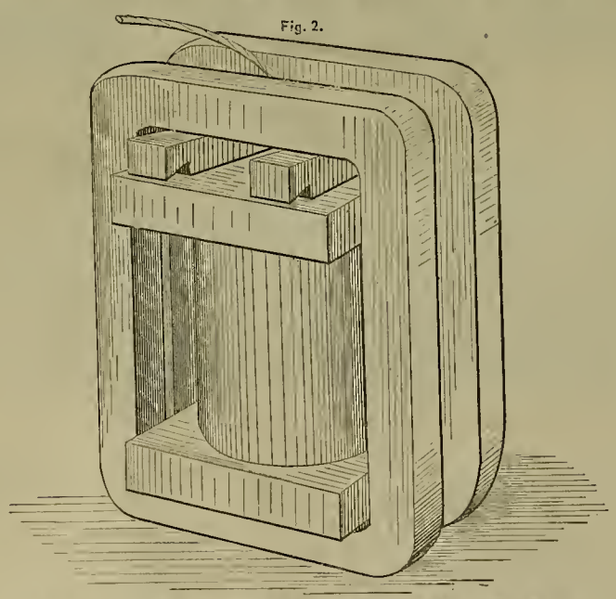

Fig. 2.

Fig. 2—CYLINDER AND FRAME READY FOR EXPLOSION.

Powder Tests.

Some tests of the relative strength of nitroglycerine and other explosives were recently made under the supervision of Frederick W. Clark of Chicago. One of the tests made in connection with these experiments was directed to ascertaining the amount of charge that could safely be fired without rupturing the cylinders. The cut, Fig. 2, here shown, illustrates the apparatus employed for this purpose. The tests so made establish that a six-gramme charge is about as much as the cylinders will stand, without danger of rupture, when the most powerful explosives are used.

The effect of the explosion on the cylinder was barely perceptible on the exterior. The interior of the cavity was usually left smooth. Fig. 1 shows the nature and the extent of the deformation caused to the cylinder.

A Mexican Paper reports that mining is being carried on with great activity in the State of Sinaloa. The camps are said to be numerous and important, and the ore-mills are equipped with the most modern and improved machinery. The Administration gives ample protection to miners of all nationalities. Recently a discovery of platinum was made, and as that valuable metal has within a short time advanced 200 per cent in Europe, everybody concerned is indulging the hope that the ore will prove to exist in large quantities. "Discoveries," if they go on at their present rate, will soon become embarrassing.

S. T. Taylor desires a permit from the municipal authorities of San Jose to prospect for cinnabar within the limits of the city reservation.

The Thomson-Houston Company at Lynn use over 3000 pounds of mica a week in their factories.

Three and a half millions of people are always on the seas of the world.

CORRESPONDENCE.

Correspondence From Mexico.

Mining in the Vicinity of Hermosillo, State of Sonora.

EDITORS PRESS:—Since the rainy season commenced, the business of mining has been looking up in this section of Sonora; a number of new companies are taking hold of properties, developing them and putting in machinery. The old companies, as a rule, are meeting with success, though some, of course, are not. It is not to be expected that everything undertaken will succeed. Success generally comes only as the result of a hard-fought battle against heavy odds.

The property known as the Popocatapeti and comprising a group of mines situated some 36 miles north of Hermosillo in what is called the "Sierrita" has been the principal producer up to this time. This, with several other mines in that locality, is the property of a syndicate of Mexicans, residents of Hermosillo, at the head of which is Dr. Rafael Fort, the Internal Revenue Agent for the State of Sonora. From these mines large shipments of rich ore have been made for many months past, this ore running frequently as high as $600 per ton. They have taken out many thousands of dollars at small expense. A number of years since Magruder & Fresh had a mill in operation, located near these mines on a lode called the Santa Elena. Their ore was very good and things were prosperous with them for a time, but in the deepest workings, where the vein was apparently most promising and likely to continue, a "horse" was encountered, cutting out the pay streak entirely, nor has much prospecting work since done discovered it again. After prospecting on the outside, as was supposed thoroughly, without the discovery of anything of value, the mill and other movable property was transferred to El Yeso, where the owners, after many discouragements, are meeting with deserved reward for their perseverance. One can never say what is in the ground, as prospectors the world around can testify.

A syndicate of Mexican capitalists has a concession from the Federal Government in a district called the "Alameda," near Opodepe. Some prominent Government officials are connected with this enterprise, and it is stated that during the short time they have been engaged in exploring their tract of country, they have discovered several valuable gold and silver bearing ledges. The small mill on the San Geronimo mine has been leased, and is being run by this company on ore from their mines.

Dr. Ricardo Johnson, an active mining man, whose name is a household word all through this State, has some five or six mines in this Alameda district, and I have been told that Mr. E. A. Price, who has a fine mill and some valuable property near Minas Prietas, is about to take hold, open and outfit them.

No one seems to know why the San Ricardo mill is being dismantled and sold piecemeal, but such is the fact. About a year ago the mill suddenly stopped while the company was involved in a lawsuit about some woodland. The mine is said to be good, although some difficulty was found in saving a high percentage of the gold which was amalgamated in the battery and on plates; the sulphurets which carried gold also being concentrated on Frue tables, never, however, with good results.

It is reported that the St. Helena gold mine at Delicias in the Arlape district is soon to start its 60-stamp mill. This is a large mine, although the ore is low grade, yielding only $9 to $12 per ton gold and silver. A large amount of money has been spent by this company first and last, and as yet in the nine years past they have had poor returns. Many improvements have been made here of late and a good deal of development work done in the mine in depth.

Near Babiacora, midway between Delicias and Ures, two companies are proposing to prosecute their work with renewed vigor. The Milford Mining Co. owns a large and valuable gold ledge here, but the ore is base. A year ago they erected a Wiswell mill which did not prove a success. It is now proposed to put up a ten-stamp mill in its stead, and in the hope of being able to make this a paying property.

About two miles from the Milford is situated the Bonanza mine, owned by Mr. S. R. Norton, who has associated with him Mr. Balond of San Francisco and a brother from Chicago. The mine is said to look decidedly well, and their intention is to put up a Huntington mill, two pans and a concentrator very soon.

The country around Babiacora is essentially a mineral one, there being from there east to Oposura a stretch of territory that was extensively worked by the ancients, but still remains but little prospected.

In the Gavilan mines a new strike of rich ore is reported. The owners of these mines have had many difficulties to contend with recently. But the outlook is now more favorable. Everybody speaks well of their mines, especially the miners and others who have seen them.

The Yeso property has been paying handsomely for many months past, though its owners had before had rather more than their share of tribulations and trials.

The winter months in this country are delightful, though the summers are rather warm, except at considerable altitudes, where the heat is not so extreme.

In the matter of food, however, the miner does not fare as well here as in California.

"AMERICANO."

Hermosillo, Sonora, Nov 24, 1890.

Wild-Cat Mining Shares.

We reproduce the following from a Colorado paper for the reason that what is true in that State is true also in California and we suppose the world over, wherever much mining is being done:

There is scarcely a week that this office does not receive a letter from some one in an Eastern State asking for information regarding the value of certain mining stocks. Usually it is an administrator of an estate who finds the stock among the assets of the deceased. It is rare that the companies or their property are known to us or to any mining men in the State, and never yet have we heard of a case where the stock possessed any value.

The frequency of these occurrences, and the fact that a great many thousand mining companies are unknown but incorporated in this State, indicate that a large business is done in the way of selling wild-cat and worthless stocks in the East. Probably the great majority of the incorporated companies were formed for that purpose only.

So far as we have been able to learn, the method of their operations is the same in all cases. Some sharp fellows from the East come to Colorado, pick up a prospect or two for nothing and on them organize a company. They get reports from some reported to be noted experts, and on the basis of these peddle stock in the East. They often have some one in a bank or some so-called banker in Colorado to give as a reference, but generally keep the Colorado public and press from all knowledge of their operations. In our "rogues' gallery" of mining prospectuses we have some fine exhibitions of their work. The predictions made by their experts are brilliant emanations from able liars, and should be addressed to fools. There are cases, too, in which well-known citizens or business men have loaned themselves to these robbing schemes. But generally the manipulators and participants in the spoils are all unknown in Colorado. There is, however, an occasional exception. There is one merchant in this city, prominent in business circles, who has obtained a good many thousand dollars from the South for wild-cat mining stock, not a share of which has any value. In marked contrast to that is the action of another Denver man, whose name is known all over the State, who was deceived into allowing his name to be used as reference. When he learned the worthlessness of the stock, he bought every share that had been sold in the East or elsewhere on his recommendation, paying all that had been paid for it.

The Trades in New York.

Quite recently a careful inquiry has been made into the condition of the various trades in New York City, and the conclusion is that the laboring man is now better paid, housed and fed than at any former date. Workmen are more thoroughly organized than ever, and the work of perfecting their organization is constantly going on. The tendency is to the decrease of the Knights of Labor, the local organizations of which were largely made up of men of different trades in one body. In place of the Knights has grown up a powerful body, the American Federation of Labor, organized each trade by itself. At the last report there were 62 national and international separate trades, comprising 586,000 members, belonging to the Federation, of which Samuel Gompers is president. In the last six months about 300 local organizations have been added to the Federation. The plan of keeping the affairs of each trade as much as possible in the hands of men belonging to that trade, which is the peculiar feature of the Federation, works well. New organizations are constantly springing up. In many trades it is almost impossible to get anything done without paying union wages and conforming to union rules. One tendency which workmen can hardly view with satisfaction is to drive a great deal of work out of the city to points where there is more freedom of action. This is noticed in the printing business and in the building trades. Doors, sashes, window-blinds, moldings and even trimmings are made in great factories in various parts of the country by non-union labor and brought here to be put together in buildings. This is also true of immense quantities of iron and stone work, which is got ready elsewhere and merely put together here. The city contractors for large buildings find it very difficult to compete with out-of-town contractors, who underbid them by means of facilities to do the greater part of the work elsewhere. There is a growing tendency to lessen strikes and keep the men more steadily at work by agreements between the bosses and the union men for a certain scale of wages to be renewed every year. The men fix the scale and the bosses agree to it, and really do not care much what the scale is so long as all the bosses are compelled to pay alike. The stone-cutters, masons, plasterers and tin-roofers have adopted the plan, with good results.—*New York paper.*

THERE are said to be 1500 Chinese laundries in New York City, earning over $3,500,000.

Workmen and Labor-Saving Machinery.

The spirit with which a certain class of workmen view the introduction of labor-saving machinery and mechanical appliances which from the short range of observation of the workers referred to seem to threaten changes in processes without counterbalancing compensations, has called forth some thoughtful remarks from an English publication, the *British Mercantile Gazette*. The writer demolishes many of the sophistries of the superficial thinkers who seem to lag sadly behind the age, and are altogether blind to the advantages which they enjoy as a result of ideas developed by the very spirit of progression which they condemn. The writer says:

Nearly every great triumph that has been made by the introduction of labor-saving machinery has been accomplished in the face of strenuous resistance from workmen, the class which has obtained the largest share of the benefit from the employment of such machinery. The blind and stupid feeling of hostility to labor-savers still exists in strength that has had little abatement. Only the other day strong opposition was made to the introduction in a shoe factory of an improved lasting machine, which proposes to reduce the amount of hand labor now required. Last winter an appeal was actually made by a labor organization to have prohibited the employment of a hand-press in the Treasury for the printing of paper money in America. Our readers will learn with astonishment that a trades-union in Chicago positively protested against the scheme by which the 50 American workingmen who recently passed through London were sent free of cost to them on an educational trip to Paris. The following is the extraordinary reason assigned for the protest: "Such a visit will tend to enlighten and instruct the workmen. This will increase their productive capacity, and such increase, in our judgment, only tends to the direct impoverishment of the workers." It is difficult to contemplate without a feeling of melancholy the fatuous ignorance and stupidity of such a declaration.

An increase of the power of producing articles that men require is an increase of the power of producing wealth. A workman's wages are his share of the gross amount of wealth created. The proposition above quoted, therefore, involves this assertion: That the greater the quantity of wealth produced, the poorer the producer becomes. If we were without experience of the actual operation of the matter, we should be entitled to believe that the larger production would give larger wages, and this, in fact, is precisely what has happened and does happen. It is wholly beyond dispute that while wages have steadily advanced with the continuous development of labor-saving machinery, the prices of commodities have with equal steadfastness declined, so that not only has the workman more dollars to spend, but each dollar will buy more of needed things than it would have bought in any previous age of the world. Not only is this indisputably true, but while the labor-savers have brought to workmen a greater capacity for purchase, they have brought to them other blessings of a no less desirable character. Machinery for the economy of human labor, for lightening the dead burden of toil which has pressed heavily upon man since he was first created, belongs almost wholly to the present century; and during this century the laborer has made further advances in dignity, in social consideration, in political power, than he made during any five centuries preceding. It is easy to understand why the labor-saving machine should have wrought out such an issue. It gave to the workman more money, more leisure, and a greater share of education, and thus put him higher in the social scale and clothed him with greater power. If he had used more wisely his opportunities he would be even better off than he is now. The measure of his blindness and folly is accurately indicated by the circumstance that, in spite of what machinery has done for him, he persists in making war upon it. His best friend is the progressive inventor, but the workman stupidly regards that individual as his worst enemy.

The opposition to the increase of production by improved machinery is based upon the widely held belief that there is only a certain clearly defined quantity of work to be done, and that if a machine be devised which will do as much as two men, it will force one man into idleness. This is a sheer delusion, proved over and over again in the years past to be without any foundation in fact. It involves the theory that there is continual danger that too many good things will be made; in other words, that we are in constant peril of having overproduction. No such thing as overproduction of the necessaries of life is, however, possible. The proof of this assertion is that there will never be too great a quantity of good things until human desire is satisfied, and human desire is in truth insatiable. How many persons are there in this country who have as much of everything as they want? Not one. No such persons exist or will exist. Indeed it is obvious that the vast majority of men never have anything that can be fairly regarded as an approach to satisfaction of their reasonable needs. While this state of things endures, it is incontestably foolish to entertain any dread of overproduction. What is wanted is that some plan shall be devised for enabling men who want to obtain the power to get it. Labor-saving machinery in a measure performs this function by cheapening commodities, while it advances wages. It would do much more in this direction if the men who used it had sense enough to perceive what are the true obstacles to their success in life.

Steel-Wire Cables.

On Sunday, Nov. 23d, the Ferries & Cliff House Cable Railway Company put a new cable on its branch running from the power-house, corner of Mason and Washington streets, to Central avenue, via Jackson and Washington streets.

The business on this branch is quite heavy. The cable crosses both the Sutter-Street and California-Street extensions, and makes seven right-angle curves besides passing over two high hills. It is considered a severe test on the cable, and such as only the highest quality and make can withstand.

The cable above referred to was 26,500 feet long, 1¼ inches in diameter, and weighs 58,000 pounds. It was made by the California Wire Works, who have been for 32 years in the business of manufacturing wire cables and ropes, and who probably, of all wire-cable manufacturers, have had more direct experience with the cable system than any other concern in the world, Mr. Hallidie, the inventor of the cable system, being also the president of the California Wire Works.

The work performed by this cable is remarkable as compared with the cables made by other makers and used on the same place under the same conditions and circumstances, and entitles it to be noted by this journal, which is at all times pleased to give credit to our home manufactures when justly entitled to it, and which the following interesting record verifies:

The first rope put on this route was made by the California Wire Works, in this city, and did its work faithfully for 177 days.

The second rope was made in the Eastern States and lasted 110 days.

The third rope was also made in the Eastern States and lasted 104 days.

The fourth rope was made by the California Wire Works and lasted 154 days.

The fifth rope was made in the Eastern States and lasted 131 days.

The sixth and last rope, taken off Nov. 23d, was made by the California Wire Works and lasted 303 days, and during that time traveled over 43,000 miles.

The total life of the three Eastern-made cables has been 345 days, or an average of 115 days each, while the total life of the three San Francisco made cables has been 634 days, or an average of 211 days each, or 83⅓ per cent over the Eastern-made ropes, and the rope just taken out has lasted 2 3 10 as long as the longest-lived rope of Eastern make.

Our inquiries have gone further, and we have ascertained that the cables on the other branches of the Ferries and Cliff House Railway Company, which have been made by our local manufacturer in competition with the Eastern makers, have in all cases done better service, the lives of the cables which have been worn out being as follows:

Power-house to Market street, via Powell; Eastern cables have averaged 124 days; California Wire Works, 180 days.

The cable now in use made by the California Wire Works has been running 238 days.

Power-house to North Beach, via Mason street: Eastern cables have averaged 120 days; California Wire Works, 190 days.

The cable now running was made by the California Wire Works and has been in 296 days.

Power-house to the ferries, via Clay street and Sacramento street: Eastern cables have averaged 116 days; California Wire Works, 185 days.

The present cable has been running 271 days, and was made by the California Wire Works.

How much longer the rope now in will last we cannot of course say, but as in cable railways, so in railway cables, we are glad to show that San Francisco takes the lead.

We are likewise assured that similar results have been obtained in other lines of this city.

These cables were made in a special manner by machinery, patented by Mr. Hallidie.

The body of the truck on which these heavy cables are hauled is made of heavy wrought-iron girders, and has axles 8" diameter and tires 16" wide. The great width of tire enables it to pass over ordinary roads without doing them any injury. Sometimes as many as 60 horses have been employed in hauling a load of 90,000 pounds.

AT the Iron-molders' headquarters a notice has been received from the executive board of the National Union declaring three Eastern strikes off and admonishing all local unions to keep out of trouble. An amendment to the constitution has been proposed providing that no local union shall go out on a strike until its grievances have been officially investigated by the national body.

THE Helena *Journal* announces that the effort to establish a Mining Stock Exchange in that city has proven a flat failure.

THE State of Wyoming proposes to hold a mining convention in Cheyenne about December 15th.

San Bernardino County.

Its Mineral and Other Resources.

NUMBER XXIII.

[Written for the Press by James H. Crossman.]

Clark Mining District—Continued.

In this district both wood and water are sufficiently abundant for all practical purposes—the wood mesquite and nut pine; the water flowing from living springs. The strike of the vein is northwest and southeast, dipping northeasterly at an angle of 45 degrees. The footwall is usually a dolomitic limestone and the hanging-wall a calcareous shale. The veins are evidently true fissures and go to the deep. The largest and most prominent group is situated at an altitude of 5600 feet above the level of the sea and from four to five miles in a northwesterly direction from the town of Ivanpah. This group contains the following veins, viz: The Monitor and the Beatrice No. 1 and No. 2, owned by Julius Jacobs of San Francisco. These veins were discovered in the spring of 1870 and have been regular bullion-producers ever since. The ores treated have been worked in a five-stamp mill. The veins, though small, have the Alley, its ore being of the same character and values. This mine has been developed by a tunnel 300 feet in length giving backs of 250 feet on the vein, which is 12 inches thick. This mine has also been profitably worked since its discovery.

The Alps lies east of the Stonewall and is a dividend-payer.

The Copper World lies on the southerly flank of Clark mountain at an elevation of 5000 feet above sea level. Croppings extensive, showing evidence of a large deposit. Ores oxides and sulphides, with some metallic copper. It is developed by two shafts of 50 feet each and two tunnels—one 75 and the other 15 feet long. Ore varies from 20 to 82 per cent copper. A number of shipments was made to San Francisco in 1869 of 75 per cent copper. Vein about 50 feet, lying between walls of lime and porphyry.

Mescal Mining District.

This district is situated six miles south of Ivanpah. It was discovered in 1885. Work of development by McFarlan and Barrett.

At the Cambria mine, the gangue is quartz inclosed in dolomitic limestone; course southwesterly and northeasterly; dip 30 degrees east; assay values, silver 50 ounces and gold $5 per ton. In 1886, parties in Los Angeles purchased the property and erected a 10-stamp mill. Since that time the mine, though possessing that took its rise in the summit and debouched into the valley. The alluvions that formed the bed of this ravine showed evidences of mineral stain, which increased as the party advanced—the ravine finally contracting and forming a box canyon. The erosive action of the water had cut a deep gorge by the side of a mammoth ledge of quartz that formed a westerly bank, which had a vertical height of about 35 feet—the formation being mineral-stained with the colors of green, blue and red. Silver was also seen spotting the rocks as chlorides and sulphides. The prospectors were sure that they had discovered another Comstock. They followed the bed of the canyon to a point where it had bisected the lode, when was seen on the opposite side, near this point, a strong spring of pure water flowing from a crevice on the west bank. The party came to camp, unloaded their jacks, cooked and ate their frugal repast, spread their blankets, and slept the sleep of the just, dreaming of marble palaces with silver walls and golden pavements. In the morning, both mines and water were located, and in 1862 a small mill was put up for working the ores.

Not long after, the Indians burned the mill and killed the men, causing the camp to be abandoned. Troops were sent from Mojave Station, but the Indians had already made good their escape. The mine lay idle till 1873, when but carries a low-grade ore. It could probably be worked with profit if fuel could be cheaply obtained and a plant could be had sufficiently large to handle it in quantity.

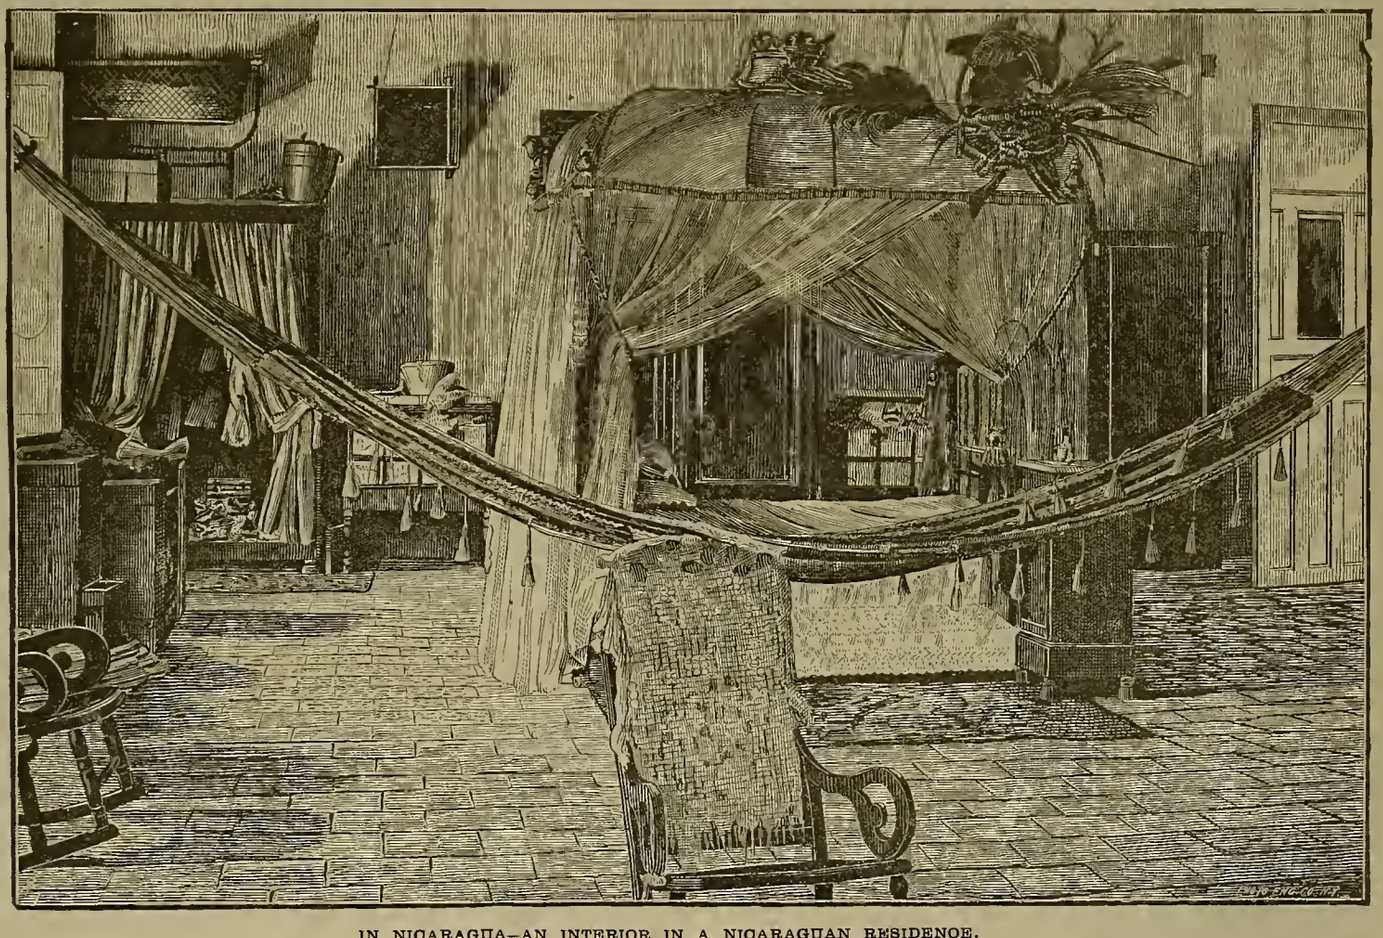
The Montezuma is a strong vein, carrying an abundance of ore rich in silver, galena and carbonates of lead. Though but little developed, the camp possesses every facility for economical workings—wood (nut pine and juniper) being abundant, with water sufficient for all practical purposes. The water level is reached at a depth of from 300 to 400 feet. Elevation 5000 feet above tidewater; distance from A. & P. R. R., 30 miles, over a natural highway of easy grade.

(To be Continued.)

In Nicaragua.

The course of events apparently justifies anticipations of the realization of the interoceanic canal enterprise via Lake Nicaragua. In his message to Congress the President says: "The Nicaragua canal project, under the control of our citizens, is making most encouraging progress, all the preliminary conditions and initial operations having been completed within the specified time."

The progress of the enterprise adds new interest to scenes representing the locality through



IN NICARAGUA—AN INTERIOR IN A NICARAGUAN RESIDENCE.

which the canal will pass and the life of the citizens of the country which will thus become commercially one of our nearest neighbors. Having on former occasions, when speaking of this country, produced in the Press cuts illustrating the scenery along the route of this great interoceanic water-way, we present herewith an interior view of one of the better class of Nicaragua dwellings, the equipment of which, as will be seen, does not differ widely from that found in most of our northern homes.

But, besides a certain tropical air about the apartment and its outfit, there will be observed suspended across it the ever-present hammock, found in all warm countries, more especially in those inhabited by peoples of Spanish origin. This style of couch, which corresponds in its uses, at least, to our easy-chair or lounge, is in these countries seen everywhere—in the mansions of the rich and the huts of the peons alike, it being in these hanging and gently swaying beds that all take their siesta or midday sleep. More often they are suspended in the veranda than in the interior of the dwelling, as shown in the cut. These hammocks, woven from strong cords, are often very tasty affairs, being dyed with many bright colors and adorned with fringes, tassels and the like.

yielded since their discovery bullion to the value of about $2,500,000. The greatest depth attained is 250 feet, with a longitudinal extent of 1200 feet. These mines have been self-sustaining from the start and are at this time in bonanza.

The Lizzie Bullock is a southeasterly extension of the Monitor; the vein is from a mere seam to four feet in thickness, ore values from 150 to 2000 ounces per ton; coin values extracted about $1,200,000. It is developed by a shaft 400 feet deep and two tunnels—one 250 feet and the other 845 feet long. The mine has been worked steadily since its discovery in 1870. The Alley mine, which adjoins the Lizzie Bullock on the north, has also been a large producer. It is developed by a tunnel 400 feet long which gives 100 feet of backs. The assay value of the ores varies from 300 to 4400 ounces per ton; $100,000 have been paid in dividends. The ores work in the free way up to 95 per cent of their assay value. This mine has paid larger proportionate dividends to the amount expended than any other in the district. The two last-named mines, and a 10-stamp-mill in which the ores have been worked, belong to J. A. Bidwell.

The Eugenia has been opened by a tunnel 100 feet in length; ores rich but spotted.

The Snowstorm is situated half a mile north of the Beatrice and on the contact ledge; prominent croppings between incasing walls six feet; gangue free-milling quartz averaging $300 per ton. But little work has been done on this vein, and none for a number of years past.

The Stonewall mine of the same group and date of discovery, is an easterly extension of intrinsic merit, has been worked with but little energy. Preparations are now being made, however, to work it in a more energetic way.

Bullion District.

Lies seven miles southeast of Nantan. It contains a number of promising veins carrying ores of both silver and gold. But little work has as yet been done here.

New York District.

Is situated in the northeastern portion of San Bernardino county and about 20 miles east of Clark mountain. It is one of the oldest mining districts in the county and has attracted considerable attention—the mountain in which the district is located being a marked feature in the landscape.

Shortly after the excitement that followed the discovery of the Comstock lode, the whole country west of the Rocky mountains swarmed with prospectors in search of its counterpart. At that time impecunious frontiersmen and prospectors could easily obtain costly prospecting outfits from prosperous traders and merchants for a share in their discoveries and locations—it being considered a good investment. The desert region of San Bernardino county was, with other localities, visited by these adventurers. New York mountain presented an attractive field, as it bore the earmarks of mineral wealth. Its mountain slopes were covered with nut pine and cedar. Strong evidences of the existence of water in the range were visible. In 1861, a party of prospectors who had been ranging eastward from Death valley entered this mountain by a broad ravine it was sold to Messrs. Winchester & Co. of Elgin, Ill., who opened it and built a mill containing a Whelply-Storer pulverizer and two pans. The ore proving rebellious, the mill was closed down and has remained idle since.

The veins here crop boldly to a hight of from 10 to 40 feet and hold for considerable distances on their line of strike. They are well mineralized, show every evidence of value, and range from six to eight feet in width. They occur in a quartzose gangue, the ores being argentiferous and carrying the bases of copper, lead and silver; assay values from 40 to 100 ounces per ton. The core of the mountain ranges here is syenitic, flanked by lime and porphyry, the veins usually occurring on the contact.

The Gladiator, one of the most prominent veins of the district, crops boldly for a distance of three miles with a N. W. and S. E. strike. This mine has been developed to a vertical depth of 300 feet, showing a well-defined ledge carrying smooth and perfect walls standing nearly vertical. The ore is reported to have averaged 100 ounces per ton.

The Highlander is a companion vein lying in the vicinity of the Gladiator, carrying ores of the same general character—free where oxidized above the water level and base as soon as water is reached. To successfully treat these ores, dry crushing and chloridizing furnaces are necessary.

The Belfast lode adjoining and running parallel with the Highlander, carries a large body of base ore, being contaminated with antimony, arsenic and sulphur. The most of this ore is low grade.

The Texan is a well-defined and strong vein,

The New Alloy discovered by Keith of Brokenheim, Germany, is claimed to practically resist the attacks of most acids and alkaline solutions, and may therefore be very advantageously used in the laboratory to replace vessels of ehonite, vulcanite or porcelain. It is composed of 15 parts copper, 2.34 parts tin, 1.82 parts lead and one part antimony.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AT SUTTER'S CREEK.—*Ledger*, Dec. 6: Developments still continue to improve as they open up. At the North Star the veins continue to widen and the rock is rich. They have already about 30 tons hoisted to the surface. It will be some time yet before they will be able to give the extent of the vein, but it has every appearance of a permanent and well-defined ledge. At the Rose mine they have not cut through the vein yet, but have passed through sufficient to convince them that there is a large amount of quartz, and so far it is of a paying character.

ALONG THE MOTHER LODE.—Twenty stamps of the New London are kept running. This is only one-half the capacity of the mill. It is reported that the Plymouth Con. will resume crushing shortly on ore from the small vein of rich quartz recently discovered. Ten stamps of the mill of the Amador gold mine have been running for several days on rock from the Doyle mine in Hunt's gulch. Crushing was brought to a temporary standstill Thursday by the breaking of the reservoir. So far 100 tons have been passed through, and from the appearance of the plates and batteries the millman, John Delzell, estimates a yield of $3 per ton. While this is low-grade ore, situated as this claim is for economic working and with the large ore bodies in sight, it leaves a good margin of profit. It may be said to be surface rock, as the quartz is taken from a tunnel less than 100 feet from the grass roots. The intention is to put through about 1000 tons so as to get a thorough test of the paying quality of the ore. At the Gover everything is running in good shape and lively times are expected in the future. There is a large supply of 14-inch square spruce timbers on the ground, as the company is going down to the 1000-foot level and will retimber the shaft as they go. The bottom of the shaft has not been seen for 13 years. After the water is taken out the company will commence sinking with the intention of going 300 feet deeper at once. The mill is kept running from the 600-foot level, which is a very good proposition. The pumps have arrived and are being placed in the mine. A large dam has been constructed at the 400-foot level, and a large room made in the hanging-wall so as to keep the pumps clear of the shaft, the largest weighing five tons and the smallest four tons; capacity, 200,000 gallons per 24 hours. Very simple in their construction, they are very fine pieces of machinery and will require but a minimum amount of attention. Electric dynamo is situated at the mill which will generate the power by three copper wires to be transmitted to the motors connected with the pumps at the mine. Dynamo is to be run by Pelton wheel, with Hyde governor and governing nozzle adjusting the gate and water on wheel to amount of horse-power to be generated by the dynamo. Dynamo capable of generating 15-horse power or one-horse power, and the Hyde governor regulates the water accordingly. This same dynamo will be capable of running their hoisting works and will be used in lighting their mill and mine. They have duplicate parts of their dynamos and motors. Shaft as far as the water line, 600 feet, has been retimbered and new track laid.

Calaveras.

SHEEP RANCH.—*Chronicle*, Dec. 6: The Sheep Ranch mine is in active working operation and is still producing its never-failing output of bullion. The mine is now at a depth of 1100 feet and heavier machinery will soon be erected, as the owners propose to commence further sinking. Over 70 men are employed in working this property, and as many more in supplying timber and wood for the mine. A yearly run consumes over 5000 cords of wood. The Wood mine, three-quarters of a mile from town, is a new property recently opened up and controlled by an English company. Teamsters are busily engaged in hauling ore to the mill, which is run by water-power, and everything points to another successful mine being discovered in that section of our county.

Butte.

OPERATIONS AT THE GOLDEN GATE MINE.—*Union*, Dec. 3: The operations of the Golden Gate mine, at Oroville, in turning the waters of Feather river, in order to work the bed of the stream for its golden treasures, have engaged much attention, owing to the magnitude of the enterprise, as it is the greatest of the kind ever undertaken in California, and it is expected that the claim will not yield less than $1,500,000. A trainload of excursionists went from Marysville to Oroville the other day especially to see the mining works, and the following brief description is given by the *Appeal*, of the way in which the operations are conducted: The main flume, through which the river is carried, is about 30 feet wide and four feet high, and the water rushes through with tremendous velocity. Much engineering skill was required to build this flume, as the lay of the river-bed is very uneven. It is substantially constructed, and is calculated to withstand the high waters in the winter. The dam is provided with several gates, which may be opened to allow the river to follow the channel. A very novel and interesting feature of the mine is the river's being made to do its own work. Every few hundred feet a large water-wheel is built over the main flume and is driven by the swiftly flowing water. The power thus generated is transmitted by means of wire cables to pumps or elevators, by means of which the seepage from the dam is raised and emptied into a smaller flume. This, in turn, is made to run still more elevators, so that a complete system of river draining is had. As one gazes upon this vast enterprise, he cannot but marvel at the great things which large corporations can accomplish, and the indomitable energy and courage men must have to undertake such a scheme, fraught with so many difficulties and uncertainties and requiring such an outlay of capital. Hundreds of men are at work with pick and shovel, and to see the old-fashioned rockers separating the dust from the gravel and sand, brings to mind very forcibly stories of the "days of '49." The mine is provided with electric lights, and is kept in operation day and night. This has been a most favorable season, and the owners are very certainly improving the dry weather by "making hay while the sun shines." As soon as the rains begin, operations will cease, as the river will be covered.

WILL DRIFT THEIR GROUND.—*Register*, Dec. 6: The Spring Valley Co., having given up working their ground at Cherokee by the hydraulic method, will now commence crushing the auriferous cement, for which purpose they have an abundance of water. This idea for obtaining gold from the hardpan or cement opens a new source of wealth in this State and one that promises to last for many years. The quantity of gold-bearing cement is almost unlimited California, and this will continue to be worked for many years. The cement is blasted and then crushed like quartz rock. It is then run through an arastra and ground up into fine powder. While the returns are not large, they are certain, and the amount of gold obtained pays well for the labor of obtaining it.

Napa.

CINNABAR MINING DISTRICT. — *Calistogian*, Dec. 3: The Georgia quicksilver mine, located three miles east of Pine Flat, is attracting much attention, and if reports are true it will become a paying property. It is not new ground entirely, but the claim under a different name was prospected years ago, at which time some quicksilver was extracted from it and taken to retorts on another claim. The result of this trial was not entirely satisfactory, though considerable metal was found. The vein recently discovered is reported to be two feet wide. Several specimens of very rich ore are being exhibited about town and the excitement begins to assume proportions similar to that of a few years ago, when the Pine Flat leads were first discovered. The Pine Flat district, or more properly speaking, the Cinnabar Mining district—is a wonderful section of country as regards its strong indications of the presence of quicksilver. No one goes over the district without expressing the opinion that valuable quicksilver mines will finally be opened there. The large amount of float cinnabar found at very numerous places can lead to no other conclusion; but the immense amount of money expended in the district has not thus far resulted in opening a mine of value. There are promising claims, however, and the best of them are the Georgia and Black Bear, the latter being owned in part by Calistogians. On these properties there is sufficient to base hopes that Cinnabar district will yet come to the front as a valuable producer of quicksilver; for with actual proof in two mines that quicksilver can be mined there in paying quantities, prospecting will be engaged in from time to time and will probably result in opening other profitable mines.

Nevada.

NEW MINING ENTERPRISE.—*Transcript*, Dec. 4: A. Isoard and R. C. Walrath have put men at work to develop the West Harmony drift mining claim. The shaft which was put down to a depth of 100 feet some years ago, and which has since caved somewhat, is to be deepened. This shaft is 1000 feet west of the shaft of the Harmony company's claim where a rich strike was recently made.

Placer.

TUNNEL FINISHED.—*Republican*, Dec. 6: The tunnel at the Gray Eagle mine is completed and was accepted by the company last Friday. It is 2500 feet long and will be extended 100 feet farther before an upraise is made.

KING'S HILL MINING CO.—*Republican*, Dec. 7: This property, under the management of Thomas B. Everett, is situated on the Iowa Hill divide, about three miles from the town of Iowa Hill, between Big Indian and Shirt Tail canyons, in one of the richest mining sections in the State. The company have title to 640 acres, nearly all of which prospects well in placer gold, enough so that it is expected to give large returns when the plant is in operation. Preparations are now being made for active work as soon as the plant, which consists of the Freeman dry process, can be procured. This plant has been tested upon the ground to the satisfaction of all parties interested.

Plumas.

DRIFT DEPOSITS.—*National*, Dec. 6: The mining prospects and recent developments in Plumas county are very encouraging and promise some large returns in the near future. Between Gibsonville and LaPorte the Scotch Co. has just completed the largest and finest mining shaft known in Northern California, and it has a very large lead or channel of blue gravel that has the appearance of being exceedingly rich. The company works its mine by drifting and raising only the pay gravel, and it has every convenience and all the modern improvements for working the mine and saving the gold, and the example set by it will be followed by other companies who have valuable mines and who have been tied up by injunctions or by fear of them.

San Bernardino.

STRUCK COAL.—Riverside *Bee*, Dec. 4: J. H. Beaulieu reports striking a good vein of coal in one of the canyons leading up from the Santa Ana river to the southeast. He had a sample of it in town, and it was exceedingly good coal. He says the vein is large and thick, and lies high up on the mountain on Government land near the line of the Santiago grant. There is no question about coal being in the mountains south of town, of good quality and unlimited quantity, and some lucky individual or company will strike it rich one of these days.

San Diego.

MANGANESE DEPOSITS.—*Union*, Dec. 4: A party who has been looking after manganese in this State is about to begin shipping this ore to Pennsylvania manufacturers who are compelled to use this mineral in making steel. The manganese deposits in the East have become so nearly exhausted (the largest beds being near Hot Springs, Ark.), that the manufacturers have become alarmed. They have had agents looking all over the country east of the Rockies, and even in Northern Mexico, to find other deposits but without success. Then it was that the Californian, whose home is in San Diego, wrote to inform the manufacturers that the Golden State possessed manganese of remarkable purity and in vast quantities, especially in the central portion of the State, and that it is as accessible as iron ores. Another thing which is turning the attention of Eastern capitalists to this section is that San Diego, San Bernardino and Los Angeles counties all contain the mineral to a greater or less extent.

Shasta.

MINING ACTIVE.—*Free Press*, Dec. 7: There is more life and activity in mining at the present time in the mining districts of Shasta than has been manifested for a long while. One of Frank Wheeler's boys has found a 3-foot ledge on the east side of Clear creek, a mile north of French gulch, which he traced down to the creek to a point where the placer mining quit paying, and there is to be seen a large sulphuret ledge under the water crossing the stream in a northeast and southwest course. This is on a direct line with all the paying mines of that section.

TUNNELS BEING RUN.—In the Carter & Coyle mine at Delta, a tunnel has been run 300 feet long tapping a 4-foot ledge, rich in free gold and sulphurets, 120 feet below the earth's crust. The ore averages about $65 to the ton. The ground is leveled for a new 10-stamp mill and all the machinery is on the ground. Tom Foster is down from his claim on Spring creek. About the middle of the summer he struck a rich prospect on the north side of Spring creek, about a mile above its mouth, and is now running a tunnel to tap the vein about 150 feet deep. The vein is a strong one, and prospects on the surface for 1000 feet,

Siskiyou.

FROM THE MINES.—Yreka *Journal*, Dec. 3: The river-miners at the Klamath are all busy just now hoisting rich pay gravel, and will continue operations day and night until washed out by winter freshets, or the weather becomes so cold as to freeze the ground and sluice water. The weather seldom gets cold enough to prevent digging in the bottom of the pits where the gold is found in greatest quantity, but sometimes freezes the ground near the surface, causing the large bowlders to become loose and dangerous as the hot sun during the middle of the day thaws out the ground and lets the heavy bowlders drop out. Great preparations are being made to continue work all winter in the cinnabar mines on the west branch of Beaver creek, some 15 or 16 miles from Virginia Bar. The requisite furnaces are now being packed there from Cole's station before the storms commence, together with a sawmill. At least a dozen men will be employed all winter, and when the furnaces and necessary houses are completed, the work can be carried on all winter, no matter how deep the snow covers the ground, as their work is all under ground in securing the ore. The company consists of a number of San Francisco and New York capitalists, who intend working the ledges of Beaver creek on an extensive scale.

BLUE GRAVEL.—*Telegram*, Dec. 6: W. Huntley Hampton, of Portland, Oregon, an assayer and mining engineer, who is also the United States Commissioner on mines and mining for the States of Oregon and Washington, was in the city this week accompanied by R. Gilham of Henley. They were here for the purpose of examining into our mines. Mr. Hampton informs us that Siskiyou's future lies in blue gravel, and that he has yet to see anything finer than the blue gravel which has been discovered on Greenboro about 2½ miles west of Yreka. He says that it is identical with that found at Henley, and that inside of 18 months it will have been proven one of the greatest bonanzas ever known in Siskiyou county. Mr. Gilham says that the miners have only been getting "skim" milk, but that now they will get some of the cream.

Sonoma.

QUICKSILVER.—*Enterprise*, Dec. 6: The Georgia mines at Pine Flat yield quicksilver and it is believed that the ore will prove extremely rich. A specimen now at the Sotoyome House contains 90 per cent quicksilver, and D. Lavadiere, representing an English syndicate, has offered $100,000 for the mines if a two-foot bed of ore is uncovered. In the spring the company will erect a smelter.

Trinity.

CANYON CREEK MINES.—*Journal*, Dec. 6: The coming winter will show more concerning these mines than has yet been ascertained. With two mills in operation the ore can be subjected to the only correct test—a mill test. It is the opinion of all acquainted with the country that Canyon Creek has a bright future and in a short time will rank with the best camps of Northern California. W. D. Everhart, one of the owners of the Globe mine, showed us this week the results of an assay on 17 pounds of ore taken from the mine. The rock went $163.09 in free gold to the ton and the concentrates $2810.34 to the ton.

Tuolumne.

LUNDY CAMP.—*Independent*, Dec. 7: Quite as many miners will be employed in Lundy this winter as in Bodie, and twice as many next summer.

MINING ITEMS.—*Independent*, Dec. 8: The storm has called a halt in the work of erecting machinery on the Van mine. Supt. Tischer will not be long in getting the works under cover when it clears up. The miners are hard at work since the rain commenced. The new machinery for the Pacific has nearly all arrived and been put in place, now being in working order. The new air-compressor, of 80-horse power, was expected this week. When that is in place the mine will be in complete trim for heavy work, which will be pushed vigorously. The Little Gem, a promising mining property situated two miles south of Sonora, beyond Murnan's place, and owned by C. E. Street, J. D. Barry and L. Escullachio, will quite likely be sold in the near future. We understand that San Francisco parties are after it, and also some of our local mining speculators. The mine is comparatively undeveloped, there only being a shaft to the depth of 105 feet on the property. However, a test recently made of the ore of this mine convinced the owners that they were the possessors of a valuable mine. A short time ago five tons of ore were treated at the Maltman chlorination works and gave $3 per ton in free gold and $5.25 in sulphurets.

Yuba.

DRIFT GRAVEL.—*Telegraph*, Dec. 6: In the Ayer drift gravel mine at Mooney Flat they have struck a vein of incalculable value 50 feet wide by 15 feet high. These dimensions are absolute and there are indications that it is much more extensive. The gravel from this discovery is very rich, yielding $4 per ton. All of the gravel so far taken out averages, by actual figures, $3 per carload, and any gravel miner knows what that means. Old Mooney Flat and Smartsville are entering upon a prosperous career and by and by Timbuctoo will fall into line.

COPPER PROSPECTS. — Twenty-five years ago there was a great deal of activity in the development of copper mines in this county and some promising ledges were found and worked to a considerable extent. One company, known as the Yuba Copper M. Co., expended over $8000 while working its claim and developed a good-sized ledge of copper ore that would produce, in a working test, from 12 to 25 per cent of pure copper. At the works of that company, which were located in the foothills 14 miles from this city, the ledge was prospected to the depth of about 180 feet and found to be of good size and average quality all the way down, and there was a large quantity of ore raised and some shipped to Swansea in South Wales, where a thorough test was made by a smelting process, which was considered at that time the only correct method of reducing such ore. The product of the mine was known as Peacock ore and required to be roasted thoroughly to extract the copper from it, and, as there were no reduction works of this kind then in operation in this State, and as it would require a large sum of money to build the works, and the profit on the copper product small, it was resolved to abandon the claim for the time being, which was accordingly done, and the buildings and machinery were sold. There is also a copper ledge running nearly north and south from near the Empire ranch in the direction of Speoceville, and which has the appearance of being the same class of ore as that found at the Spenceville works. Under the developments made in this class of ore and the successful working of it of late, we believe the ledges named can be made a profitable investment for capital.

NEVADA.

Washoe District.

ON THE COMSTOCK. — *Territorial Enterprise*, Dec. 5: The past season's mining operations upon the Comstock lode have been marked by steady, energetic, economical, persevering and intelligent prospecting work. More work has been done at a smaller expenditure of money than ever before known in the history of mining in Nevada, and a heavy and steady reduction of ore has been the result. The bullion-producers have also been greater in number. They were as follows: Alta, Justice, Overman, Kentuck, Crown Point, Belcher, Challenge, Yellow Jacket, Confidence, Imperial, Occidental, Chollar, Hale & Norcross, Savage, Gould & Curry, Con. Cal. & Va., Ophir, Monte Cristo and some small claims. Silver City, though hampered by ruinous litigation, has produced a goodly quantity of ore, of which profits were realized. Since the snow cleared last spring the mills of the Comstock have reduced on an average about 6000 tons of ore weekly, and in the neighborhood of 2500 tons of slimes and concentrates, and nearly 1300 men have been steadily employed. The profits in mining have been small, but this is due in great part to the extensive prospecting work that has been carried on in all the mines in the endeavor to uncover ore to keep the mills running. It is also accounted for in part by the low grade of the ore. The work in the Con. Cal. & Va. to keep the mills supplied with ore has been simply stupendous, considering the difficulties encountered in extracting it. The ore in that mine, as is well known, comes from the old bonanza workings, the stopes of which burned for several years. It is extracted right from among the timbers in many places, and drifts are run in solid wood oftentimes to get at it, and it has to be picked and sorted from the charred wood and chips and timber, as that character of material does not amalgamate. Nevertheless, the grand old mine yielded over 200 tons of ore daily during the season. A lower level is now being opened in this mine, and there is every prospect that by the beginning of next season the mine will be in condition again to supply the mills. A mine is like a farm, and the winter-time is the time to cultivate it for the summer thrashing. At the Savage a lower level is being opened, and they are already in ore on the downward continuation of the body of ore found eastward of all former workings on the 1200 level. But this mine will also need considerable prospecting work during the winter to put it in condition to yield ore the next season. There is a fair prospect that Alpha and Exchequer will be added to the list of bullion-producers next season. More prospecting work must be done in Yellow Jacket, Crown Point, Belcher, Confidence, Challenge and Imperial to make them yield pay ore next season, but they may be fairly relied upon to do so. Kentuck, Justice, Overman, Alta and Occidental will in all probability be on the list of bullion-producers in 1891. Ophir, Mexican, Union and Sierra Nevada always form an interesting quartet toward which the eyes of this community are longingly turned. A strike of ore in any one of these four would do an immense amount of good to the business of mining here. Gould & Curry, Hale & Norcross, Potosi and Chollar will probably yield ore next year, and Potosi has a chance of being a king-pin. The mining work west of the Con. Cal. & Va., in the Andes and West Con. Va., attracts more or less interest, as it is believed that ore there will yet be found in paying quantities. There is a hope entertained that work will be resumed in the Hendricks at the north end, and also in the Scorpion and East Sierra Nevada. The mining litigation in Silver City is on the eve of settlement, after which work may be expected to be resumed in all the principal mines in that district. The mining properties of Silver City pay their own way. On reviewing the entire situation the *Enterprise* believes that next year will be a fair year, though not as active as the past. But for the next four months or more it is idle for men who now find themselves with the profits of last year, to think of eating them up here and perhaps run heavily in debt before the active resumption of mining and milling operations. Farmers do not employ a full force of men the year round, and neither can mines be expected to do so.

ARIZONA.

MINING NOTES.—Mohave *Miner*, Nov. 29: Jamison & Sample shipped a carload from the Rip Van Winkle. The Empire mine is making a bigger show than ever. There is now two feet of ruby and native silver in sight, and the Empire is probably the best mine in Mohave county. J. K. Mackenzie has leased the Cupel mine and is making preparations to start work on the property at an early date. The Hopeful mine in Todd Basin is the property of Thos. P. Roberts. The ledge is uncovered for a distance of over 700 feet, showing an ore streak from 16 to 24 inches in width, which assays from $50 to $175 per ton in gold and silver the entire length. It is considered by miners to be the best showing made in this section for some time. The following shipments of ore were made from the Kingman Sam-

pling works this week: Richard Gorman of Fenner, 1 carload; Barnet Bros., from the C. O. D., 1 carload; James Cadden, 3 tons from the north extension Diana; Darden & Gilliland and Barney McCall, lessees on the Empire mine, each a carload; Brady & Burch, 5 tons from the Cedar district.

FROM CHLORIDE.—Robt. Mera and Jos. Waggoner are doing the assessment work on the Silver Hill claim. A. E. Rogers has leased the interest of J. P. Finegan in the Homestake claim, and together with James Uncopher will work the claim. H. P. Ewing and Louis Hemriod are working the Tuckaho. They will do some experimental leaching on the ore from that claim. C. E. Sherman is now working several men running a tunnel on the Independence mine. J. P. Finegan has struck a rich ledge a few yards north of his residence, and it looks as if it would be the richest mine in this section. Johnson & Schemelpfennig are working a lead claim which is paying them handsomely. A. E. Rogers recently took out a small pocket of rich ore from the Nigger Baby. It assayed something over $2000 per ton.

BRITISH COLUMBIA.

CARIBOO MINES.—Kamloops *Inland Sentinel*, Nov. 29: It looks at the present time as if a new golden era of prosperity is about to dawn upon old Cariboo, by the extensive development of her hitherto partially developed diggings and also vast deposits of auriferous earth that has never been worked before. The Victoria Hydraulic Company has located a claim on the South Fork of the Quesnelle river, about a mile from the confluence of the North and South Forks, extending up the river on either side for one mile. On this property Mr. Hepburn has been prospecting and preparing for extensive operations next spring. He has ascertained that the pay streak is about 300 yards wide, in the bed of a stream which in ages past ran in a course about parallel with the South Fork. It is about 100 feet above the river, and in places is fully 100 feet deep. This earth Mr. Hepburn is convinced will yield about $1 per yard. The company have rights for 4000 inches of water, and a ditch will be run some 16 miles next spring, the water from which, run through a 9-inch nozzle, will displace 4000 cubic yards daily. This hydraulic power will eventually be increased fourfold.

ROCK CREEK.—The Laura hydraulic mine on Rock Creek was closed down on account of freezing weather on November 6th. The claim lies on Rock Creek, about four miles from the boundary line between British Columbia and the United States. Rock Creek, rising in an eastern spur of the Cascades, traverses 30 miles of very varied country, and then pouring its turbid stream into the Kettle river, flows on to the Columbia. The claim which Mr. Jensen manages extends along the line of the creek 1½ miles, embracing 500 feet on each side. Two years ago work was started on it and the sawmill and hydraulic plant erected. The gold all lies in alluvial deposits on the banks, 80 to 90 feet high, on each side of the creek. The hydraulic power is taken from the creek itself and has a pressure of 85 feet fall. This throws a five-inch stream from the nozzle of the pipe with a force which cannot be conceived without being looked upon. It washes away the gravel and rends the huge rocks from their beds with a mighty power which shakes the solid earth. This stream has been digging and tearing away the banks continuously since April 24th, and the amount of pay dirt washed into the flumes and hoxes would seem incredible were it estimated in cartloads. Despite the fact that a vast deal of machinery and work, including 27 new boxes and a large amount of fluming, has been put in the mine this year, it has not only paid expenses but turned out an overplus. This means that next year—when no more work of this kind will occur, to reduce the profits—a very handsome return will be realized. Even as it is, it is claimed that the output of gold from this claim has been larger during the past season than that of any other in this province. Mr. Jensen is an enthusiast on the subject of hydraulic mining. He has been more or less connected with it all his life, and his opinion as an expert is entitled to due consideration. No country on the face of the earth, he says, is better adapted or more fitted for mining development by hydraulic means than are the gold-fields of British Columbia. This wonderful power is rarely utilized now, even when it is most obviously at hand and applicable, and he expects in the near future to see a revolution from the present methods to that of the one he deems so readily available.

LOWER CALIFORNIA.

CERROS ISLAND.—National City *Record*, Dec. 4: The past year has been one of important developments in mining in this part of the country. There is not the slightest doubt that on the peninsula of Lower California great mines of rich ore still await the touch of the prospectors' tools to spring into being. That part of Mexico is still comparatively unexplored and its secrets when laid bare by careful investigation will show much that will be of the highest interest to those who have the energy to take advantage of them. The peninsula is still a *terra incognita* and in its mountains and valleys it is the firm belief of competent men that rich mines will yet be uncovered. One strong argument for this is the results which have followed the development of the mines on Cerros Island. It is now about one year since operations were begun on the island and that time has witnessed important changes. The company has little to say about the richness of the ore and how it pays—that of course is their business, but the fact that extensive improvements are now being made and others are contemplated shows that there is a good foundation for such investments. Cerros Island lies off the coast of the peninsula, 311 miles from San Diego, an island about 20 miles long and from 10 to 15 miles broad. It lies at an oblique angle with the mainland, extending out into the ocean and distant at its nearest point about 10 miles. It is very rocky and in places precipitous. The mines are some distance from the landing place. Since their discovery a fine wagon-road has been constructed at a cost of about $10,000. In the last few months many buildings have been erected. Among these are officers' quarters, houses for the men, grocery store, blacksmith shop, storehouses, and others. Seventy men are now at work there, practically all being American miners. There is a spring of fresh water on the island which many make use of. For those who do not like it, water is carried down from San Diego. Three tunnels are now being run into the mountain where the main body of ore is supposed to lie. One of these is already over 400 feet in length and is provided with tracks on which ore cars are run. To transport this ore to San Diego, the company formerly made use of numerous small craft. Then it chartered the Carlos Pacheco, which also proved to be too limited in capacity, and now the Karluck has been chartered. This vessel is a steam brigantine and carries 350 tons of ore. It is expected she will make at least three and possibly four trips a month. She is well fitted to accommodate a limited number of passengers and on her first trip carried her full quota, 16. A good many persons visit the island out of curiosity to know what the company is doing. It holds the exclusive right from the Mexican Government to mine on the island for the next ten years. Three qualities of ore are taken from the mines. One is shipped to Pueblo, another only to San Diego and the third undergoes treatment on the island. From this brief statement it is plain that the Cerros Island Mining Co. is doing an important work and is a growing factor in the prosperity of the bay region.

COLORADO.

GENERAL MINING NEWS.—Aspen *Times*, Dec. 4: A most promising discovery has been made in the Castle No. 2, in the territory under lease from the Park Consolidated Mining Co. to Messrs. Howe and Tourtelotte. The particulars of the strike were not obtainable last evening, but it was learned that the work had been in good ore for ten feet. The development had not been continued far enough to show the dimensions of the ore body, but it was thought by the *Times* informant that a valuable chute had been opened.

LITTLE RULE STRIKE.—A very important strike is reported from the Little Rule. When the Driver upraise was being run a streak of very rich lead ore was encountered. Specimens taken out were declared to be the finest ever brought from that part of the mountain, but the ore was not found in sufficient quantity to give the strike any particular importance. Now the same streak has been opened in the south level, which is much deeper, and the ore is even richer than it was above, while the body is much larger. The streak is 2½ feet thick, according to the statements of those who have inspected the strike, and is solid. Assays show that the ore carries 58 per cent of lead and 258 ounces of silver per ton. In addition to this, the upper south level has developed four feet of 50-ounce ore that constantly improves as work progresses upon it. Altogether, the outlook for the Rule is exceedingly bright.

ORE SHIPMENTS.—The following are the ore shipments for the week ending Friday, November 28, 1890: To Denver, 1664 tons; Leadville, 704 tons; Pueblo, 251 tons; total, 2619 tons.

IDAHO.

OWYHEE NOTES.—*Statesman*, Dec. 7: In the Trade Dollar mine, owned by W. H. Dewey, to tap which he has run a tunnel during the last ten months, a distance of 437 feet, a large and rich body of ore has been struck. The ledge where cut by the tunnel is 21 feet wide, and in the face of the drift there is 10 inches which assays 4600 ounces in silver and $707 in gold, also four and a half feet which assays 577 ounces in silver and $12 in gold, and another part of two feet wide assaying 266 ounces of silver and $12 in gold. The tunnel at this place is about 250 feet from the surface. The ore shows in face of drift and in the top and bottom of the tunnel. In the Black Bart, another claim owned by Mr. Dewey and lying alongside of the Trade Dollar, in which a tunnel has been run 160 feet, ore has been struck which assays 69 ounces in silver and $10 in gold. Mr. Dewey has five claims adjoining each other in this place, making 3000 feet long and on one end 1800 feet wide and on the other end 1200 feet wide. He is now starting to take out ore and says by the first of January he will have out enough to repay him for what he has paid out for prospecting the five claims the past year. Messrs. Sullivan and Phillips have just returned from Boise, where they had taken over $12,000 worth of bullion. On Cow creek in this county, rich silver ore was struck by Wellinigger Bros. It will assay about $300 per ton. The deposit where struck is loose and the boys are sinking on it in hopes to find a solid ledge.

NEW MEXICO.

NEW CONCENTRATOR.—Black Range *Chloride*, Nov. 28: The new 50-ton concentrator will be running to its full capacity in a few days. It is the intention of the Chloride Mining and Reduction Co. to keep the mill running day and night upon ore from its own mines, and should the mill's capacity prove insufficient to handle the output of ore, the capacity of the mill will be immediately doubled.

A NEW INDUSTRY.—The turquoise mines of Grant county seem likely to become important producers before long. Prominent jewelers and others in the United States have been corresponding with the owners of the properties here, proposing to take the whole output of the claims.

OREGON.

PINE CREEK MINES.—*Bedrock*, Dec. 5: The Oregon Gold Mining Co. is running its 20-stamp mill night and day, treating 45 tons of ore every 24 hours up to 85 per cent of the assay value of the ore, besides saving two and one-half tons of sulphurets per day, that will average $150 to the ton. The ore is from the Red Jacket, and the company estimates that there is sufficient ore in sight to keep the mill running constantly for the next 12 months. The company has just finished a roaster of eight tons capacity for the purpose of reducing the sulphurets, thus doing away with the necessity of shipping to Denver or Salt Lake. Under the present management, the Oregon Gold Mining Co. is more successful than ever before and the camp is in a more prosperous condition than ever. The Huntington mill recently erected by Davis & Howard on the Union mine, is treating from five to six tons of ore per day up to 90 per cent. In the trial test of 25 tons, average ore, the mill saved $35 to the ton — $10 free gold; $25 in sulphurets. The Davis & Howard mill also treated several tons of ore from the Last Chance mine, owned by Carey & Howard, with satisfactory results. All development work done shows a good outlook for the camp, and more confidence is expressed than ever before. The failures in the past can be attributed to mistakes in the treatment of the ores.

SOUTH DAKOTA.

URANIUM.—Deadwood *Pioneer*, Dec. 1: Prof. Lengfeld, in his visit to Ruby Basin yesterday, secured some samples of uranium slate from the Ross-Hannibal, which he proposes to take to the school and analyze. Should the metal prove uranium, it is valuable, as $80,000 worth is annually used in the United States for making uranium glass and preparing paints.

PORTLAND.—A new body of ore was opened on the Portland yesterday. The vein is three feet wide and gives an average assay of $35 per ton. The strike was made on the Bristol, a claim adjoining the Trojan.

SQUAW CREEK.—This district is undeveloped, although it has been thoroughly prospected by Frank Bryant. For a distance of 1000 feet along the creek the outcroppings of dry ore can be easily followed, much of which assays from $10 to $30 a ton in gold and silver. In some places the developments would seem to indicate that this dry ore is a vertical vein passing through the quartzite.

UTAH.

FROM THE MINES.—*Journal*, Dec. 7: The Keystone mine at Eureka shipped six carloads of high-grade ore last week. The Eureka Hill has resumed ore shipments now that silver has advanced again in price. One hundred and forty-two tons of Anchor concentrates and 7 tons of Ada ore came in this morning. McCornick & Co. received yesterday: Hanauer bullion, $7350; silver and lead ores, $5500; total, $12,850. T. R. Jones & Co. received yesterday: Silver bars, $6100; selected lead, $1150; silver and lead ores, $2010; total, $9260. Prof. Keel came in last night from Bingham and reports that there is a great deal of activity in mining matters there and that things are looking up in the "old reliable." The Roaring Lion lessees have four men at work and are doing considerable prospecting. Some ore is being taken out. The North Star, in American Fork, came to the front last Saturday with a shipment of ore that went 40 per cent lead and 34 ounces in silver. The Brooklyn shipped 250 tons of ore last week. The Rough and Ready mine sent in 100 tons of ore last week. The Alliance sent in a carload of ore last week that assayed 38 per cent lead and 78 ounces silver. The *Tribune* says that work and development is progressing on the mining claims eight miles up City Creek canyon with flattering indications of success. The Ensign Peakers are still bringing in specimens of ore bearing, as they claim, free gold. We hope they have struck it rich, but fear they have only found "tenderfoot gold."

WASHINGTON.

THE COLVILLE DISTRICT.—*Miner*, Nov. 28: State Geologist Geo. Bethune, who has lately inspected the mines of this district, speaks as follows of some of the properties visited by him: On the Old Dominion the work is being done in good shape and systematically. They are driving at a great depth a tunnel which will not have to be driven many feet farther before the main ore bed is struck. There is probably as much ore left in the stopes as has been taken out. There are good-sized bodies exposed that will pay to mill. At the very least there must be 5000 tons of ore on the dump. The Daisy mine is second to none in the State. The entire bill is one immense bed of ore and a tunnel run in at any point would tap ore and plenty of it. The Daisy has large bodies of milling and smelting ores. The work on it has been conducted in one of the safest ways possible. Stevens county should keep her smelter going right ahead. Ten thousand descriptive pamphlets will not catch a capitalist's eye like one single shipment of bullion. The Colville district no doubt ranks among the best. In the Okanogan you will find the oldest formation in the world. Here our surface rock belongs to another and later period, but if we go deep we will strike here the primeval rock that exists near the Okanogan surface. It is foolish for the ordinary prospector to search for mineral by geological rules.

WYOMING.

COAL, PETROLEUM AND IRON.—*Tribune*, Dec. 8: According to the report of Dr. Ricketts, State geologist, there were mined in Wyoming last year 1,412,958 tons of coal. This coal is distributed through five counties, and the mines are mainly on the lines of the Union Pacific railway, which is also the principal operator of the Wyoming mines, having raised nearly a million tons in 1889. The existence of great coal-fields suggests iron manufacture and petroleum, and both of these things have sections in the present report, but not extensive. A previous report of 1887 dealt extensively with this subject, hence its omission in the present one, but from such remarks as occur, we are led to infer that many of the wells sunk in Fremont county have the characteristics of those in Ohio and Pennsylvania. In one the flow is from 600 to 1000 barrels daily. One suggestion contained but not claimed in Dr. Ricketts' report is that people boring oil wells should first read what he has written, and in that way save a good deal of money they may lose by drilling in impossible places. As to iron, while the quantity this far is not great, the quality is good. That at the Hartwell mines contains metallic iron, 68 per cent; phosphorus, .058 per cent; sulphur, 2.46 per cent, which is superior to Lake ores for steel-making. A good deal of this ore has been sent to Salt Lake to flux lead and silver ores smelted there. On the whole, one may conclude that Wyoming, like Montana, is to contain great mineral resources when they are developed.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

Mining Share Market.

Under a stringent money market and confidence impaired, railroad and other speculative securities at the East have drifted to lower levels. While this is the result at the East, in this city our leading speculative securities (mining shares) are exhibiting decided signs of returning vitality, which encourages the hope of better future, or at least, higher prices until the stock-gambling pool unloads. The pool is still using Potosi as the pivoty stock, and with good effect, too. The character of the work in the mine is such as to make it an attractive gamble. The late decline in the market brought in large lines of stock, and it is but natural for the manipulators to try to unload at a good round profit, so as to levy and collect assessments in January, February and March. Whether they will succeed in selling out, remains to be seen, for the times are not auspicious for much of a bull movement.

At the East money is scarce, failures are being reported and confidence is temporarily destroyed. In this city money is growing scarcer. Taxes have to be paid, and annual settlements made, with other disturbing influence natural to the close of the year. Soon after the first of next month money will begin to grow easier under heavy disbursements, when it is but reasonable to look for an improvement in all lines of business; but then successful stock gambling goes by the rule of contraries.

In outside mining shares, trading the past week was light. The Tuscaroras declined, the Bodies hung around, while the Quijotoas made a slight advance under reports of a contest for control. Those in position to know, affirm that there is a contest for the control of the latter—probably more for spoils than for the benefit of stockholders, yet any kind of change, it would seem, will not prove worse than the present condition of affairs.

Outside operators should not be influenced by the pool's cappers and friends using the names of Gen. Hayward, Col. Mackay and Senator Fair in connection with little stealing deals. There is nothing, so far as we can learn, to warrant the belief that, individually, any one of the above is in the market; neither is there anything to warrant the assertion that either one will take a hand in the market unless more favorable conditions of affairs are reported from the mines than now come to hand. That their agents in Virginia are closely watching the work going on in the several mines, does not admit of a doubt; but watching the mines and running the stock market are two different things.

James G. Rule, a Comstock ex-mining superintendent, is in the city. It is said that for the sum of $5000 he agreed to find rich ore in Gould & Curry. He was placed in charge of the mine, and soon afterward got his $5000. The ore, so we are informed, has not been taken out, but remains in the mine.

The stock market opened this [Thursday] morning barely steady. After call, Potosi began to shade off, closing weak at a decline of nearly $1 a share. This carried the prices for other stocks down. The street is full of bear points, although some bull points are beginning to be circulated.

The Comstock Tunnel Co. and the mining companies on the Comstock lode have arrived at an understanding regarding the royalty on all ore milled. The royalty is to be 4 per cent on the battery assays, provided the royalty does not exceed $2 a ton, or in other words, on all ores running from $50 a ton down, 4 per cent royalty is to be paid, and all over $50 the royalty is $2 a ton. The various companies affected will probably ratify the agreement some time next month.

Official news from the Comstock mines is still of picked-bone character, although a little encouragement is held out in Seg. Belcher, Hale & Norcross and Potosi. In an upraise in Con. Imperial they got in vein material, when work was stopped—probably for fear of finding ore. Private news from Potosi reported an improvement in the north drift, which sent the stock up, but as the price has gone down since, perhaps the ore has been spirited away. The work going on in the various mines is of a very important character, but no actual results are looked for for some months yet, although, in the meantime, ore is likely to be run into in one or more of the mines.

From the Quijotoas the usual reports come to hand. From the Bodies our advices report the mill still running on tailings. Some rich ore is being mixed with the tailings. The work in the mines is attracting attention. From the Tuscaroras our advices report the district never before looking so well. The outlook is of the most favorable character.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

MECHANICAL PROGRESS

Bessemer and His Process.

At the late Pittsburg meeting of the English Iron-Masters and the American Institute of Mining Engineers, a very interesting letter was read, by Sir James Kelson, from the veteran metallurgist, Henry Bessemer, giving a breezy account of his great invention—how it was suggested and oradled, and how it hae grown to its present magnificent proportions. We give the following digest of the letter, which will he found hoth interesting and instructive:

It is with great pleasure that I accede to your request to furnish you with a brief outline of the circumstances which led to the invention of my steel process. At the time of the Crimean War I had invented a mode of firing elongated projectiles from a smooth-hore gun, the rotation necessary to insure their proper position dnring flight heing ohtained hy utilizing a portion of the powder gas to produce rotation hy reaction, after the manner of producing rotation in turhines, and not hy the rifling of the gun, consequently rendering all smooth-hore guns at once snitable for firing elongated shot or shell. I of course offered this plan to our own Government, hut it was discarded without a trial.

A little after this period I happened to he on a visit for a week or two with Lord James Hay at the house of hie daughter in Paris. Dnring this visit our host gave a farewell dinner to General Hamlin and several other distinguished officers in the French army, who were going out to the Crimea.

Among the gnests on this occasion was Prince Napoleon, and while taking a cigar in the library after dinner, the conversation turned natnrally enough on artillery, and I then mentioned my system of firing elongated projectiles from smooth-hore gune. The Prince wae eo impressed with the importance of this idea that he eaid he was eure hie couein, the Emperor, would he much pleased if I wonld explain my inventlon to him, and that he would get an appointment made with the Emperor for this purpose. This was done, and I had a long and most interesting discussion with His Majesty, whom I found most thoroughly conversant with the whole subject of srtillery. Hie Majesty, in the kindest possihle way, gave me carte hlanche to make any experiments I desired at Vincennes.

Some Early Experiments.

A great many 30-pounder elongated projectiles were made, and were fired from a 4½-inch 12-pounder emooth-hore caet-iron gun at the Polygon at Vincennes. They were fired through a euccession of thin wooden targets placed 100 metere apart, through all of which they cnt circular holee, thus ehowing that they went end on; a thin coat of hlack japan had heen purpoeely put on them, and when the ehots were recovered from the hank in which they were lodged, the coat of japan was seen to he partially ecraped off in spiral lines, caused hy their paeeage through the wooden target; the angle of these scratchee heing carefully taken, ehowed that from 1½ to 2½ rotations had taken place in the length oi the gun.

After many houre' practice, on a cold Deoemher day, we retired to the officers' quartere in the old fortresa of Vincennes, and while etanding around a hlazing wood fire, eipping some hot epiced wine, Commandant Minie (the inventor of the rifle) observed "that, although the rotation of the ehot was effected, nnlese we had eomething hetter to make our guns of, such heavy elongated projectiles could not he need with safety." This casnal observation was the spark that hae kindled one of the greateet Indnstrial revolutions that the preeent century hae to reoord, for during my solitary ride in a cab that night from Vincennes to Parie, I made up my mind to try what I could do to improve the quality of iron ueed in the manufacture of gnns.

My knowledge of iron metallurgy was at thle time very limlted, but this was in one eense a great advantage to me, for I had very little to unlearn, and eo conld let my imagination have fnll scope. After many monthe of trial and much huilding np and pulling down of reverheratory furnaces, I cast a small model gun. The iron was very white, and in turning it, little short curly ahavings were cut off. It wae wonderfully tough for oast iron, hut remarkahly hrittle if olassed ae wrought iron. The little model gun looked very heantifnl when highly poliehed, and I took it to Paris and hegged the Emperor to accept it as the firet frulte of my etndies of the metallnrgy of iron. He expreeeed himself mnch pleased with it, and complimented me on having achieved a etep in the right direotion, and with his own handa placed it in a hurean, eaying, "Some day it may hecome an intereeting relic."

On the Eve of Discovery.

Ahout this period I hegan to fully appreciate the faot that if I could improve oaet iron and render it malleahle, and etill retain ite fluid state, apart from ite use for artillery, it would he of the greateet oommercial value for all engineering purposee. I therefore pursued my exp riments with greater ardor than ever, for I was convinced that I was on the eve of producing a quality of metal that wonld snpersede wrought iron. I consulted Mr. George Rennie, the eminent civil engineer. I ehowed him a small upright fixed cylindrical converter, and in it we made a charge of 700 pounds of Blaenavon pig-iron into an ingot of malleable iron. Mr. Rennie was in raptures with the result, and said: "You muet not keep this light under a bushel for a single day longer; and, hy the-by, there is a first-rate opportunity for you. The British Association meets at Cheltenham next Tuesday; read a paper there hy all means. I am president of the mechanical section. It is true all the papers are arranged, hut if you will write a paper, I will take the reeponeihility of putting it first on the list." He kept his promise, and I read my paper "On the Manufacture of Malleable Iron Without Fuel."

The entire iron trade of the kingdom wae startled hy the facts detailed in this paper, hacked as they were hy two small hars of malleable iron, one of which had heen piled and re-rolled. A few days later the ironmasters came trooping np to London to see the new proceee. There are many interesting incidents connected with these vieits, which I cannot trespass on yonr time to relate; hut some idea of the excitement may he gathered from the fact that, notwithstanding the imperfect etate of the process at that time, I was aotually paid £27,000 for licenses granted within one month of the reading of my paper. At many ironworks, the managers set to work to test the invention in the rudest possihle manner, with such means aa they had at their disposal, all of which attempts were failuree. In my experiments I had used Blaenavon pig-iron, which was successful, and at that time I had no idea that other hrands of iron would fail in the manner they did. No sooner were these failures known than an extraordinary revulsion of feeling was manifested, and the most perfect dietrust of the invention hecame universal. The pnhlic press, which had spoken of it in such glowing terms, now condemned it as impracticahle, and spoke of it as "a hrilliant meteor that had flitted across the metallurgical horizon, dazzling a few enthnsiasts, and then vanishing forever in total darkneee."

Blacksmithing.

Something for All Mechanics to Conoider.

There ie no trade of more importance than hlacksmithing. It enters, more or lees, into every department of ironwork and into most parts of woodwork. To he a good hlackemith requires large experience and much mechanical skill. The expreeeion ie often heard in regard to an unskillful machinist: "He'e nothiug hut a hlacksmith." Well, if a man ie nothing hut a hlacksmith and is a good one, he is most certainly a skilled mechanic. There is nothing in the nature of hlacksmithing that is one whit helow or requiree less mechanical ekill than the workman in any other department of ekilled lahor.

It has, however, heen sometimes said that hlacksmiths are more inclined than other mechanics to keep to themselves the little secrets of their trade that they may have acquired through experience, or which have heen handed down hy friende. Many of that particular calling argue that since they have spent yeare in acquiring the knowledge they poseess, they cannot afford to part with it for nothing. This is certainly a very poor way of reasoning or thinking. Time perhape wae, 20 or 30 yeare ago, when technical papers were almost unknown, and there might have heen some exouee for imparting information when no knowiedge in kind oonld he received. But the ahundance of technical papere at the present time devoted to imparting euch information rendere it most important that every one who hae a new idea ehould make it public for the henefit of all. If each will do his part in that way, all will he henefited. This is a policy which will well repay as we progreee.

There are many, eaye a cotemporary, in all our large shops, hoth hlackemiths and machinists of all olaeses, who can make their names a household word and secure a host of friends hy just jotting down items of mechanical intereet. The hoy of to-day ie the man of tomorrow, and never forgets the source from which he received a benefit while learning a trade.

Mr. D., for example, might come out of his shell, and we ehould all listen to him with pleaeure. Some good man on locomotive work might discuee the queetion of forging a locomotive frame, or how to forge a double eye, if ont of the eolid, and how to do it if welded, with reaeons for the method given.

Then there ie the hlacksmith who used to forge ateel hand-hammers at one heat. He could certainly tell many of ne eomething. Again, many a country hlackemith does a good joh nnder difficulties that wonld appear insurmonntahle to many who have every convenience at hand.

In marine work there are plenty of examples of expert forging. A eet of examples of forging, heginning with a eimple holt with solid head and with welded head, deecriptiona of the various kinds of welde and points ahout welding, and so on, would do a world of good to our young men, and would bring out pointe of interest to all. Welding and hending angle irone ie another hranch that will well hear diecuesing. Let each one do his part and write of that hranch with which he ie hest acquainted and all will learn something.

RACING across the Atlantic hy the fast steamers will he discontinued hy mutnalag reement. The enormons cost and riske for bid the continuance of euch contests.

SCIENTIFIC PROGRESS.

The Evolution of the Horse.

At the recent National Exhihition of horses in New York, more good animals were brought together than were ever seen in one collection in this country. With this statement goes another fact, that some of the fasteet horses in the world are produced in the United States, and that California is one of the foremoet States in the matter of horse hreeding. But there is much more than this apparent. The trotting horse is an evolution hrought ahout in this country. Such horses make no prominent figure in England. The running horse is always in the lead. Now, one of the greatest gains in the evolution of the horse in this country is the prodnction of a roadster. Racing is a mere incident. The runner is never a roadster, and is in no prominent sense a utility horse. But the trotter comes to this at last that he is a superh road horse. Beyond all other gaine, this ie the greatest. The heet of these will go over the road at the rate of ten miles an hour for several consecntive hours. A mile in six minutes is fast enough for any horse not designed for the race-track, hnt the same roadsters will frequently do a mile in three minutes.

Some recent criticisms touching the evolution of the horee are to the point that the swift horse is no longer a handsome animal; that he is freqnently under size and is far from the ideal of a symmetrical animal. The form has heen sacrificed to speed. It is seldom that the winners of prizes on the race-track are 16 hands in hight or weigh much over 1000 pounds. They are comparatively small horsea, and very few of them would he suitshle for the road. The Kentucky horsemen prodnced two famous classes of horses. One was the saddle horse, which for pluck, speed and endurance probahly never had a euperior in thie country. The other olase was the road horee, whioh hecame famoue all over the country. He was not a small horee, hut was well up on the withere, high-spirited and of splendid action. Of course there wae also the running horse, which was the especial pet of the Kentucky hreeders.

But the evolution of the trotter has probahly brought more wealth to the conntry hy hie general utility than any other claee of horses. He is now everywhere on the road—high-spirited, strong and swift, he is the pride of thoueands who take no intereet in the race-track and care nothing for runnere, hecanse they are not adapted to the road. The road horse ie an evolution which hae heen brought ahont hy epecial training. There were never eo many good ones in the country at any former period. Not one in a thousand of these ever makes any prominent figure on the race-track, hut they figure as never hefore in the wealth of the country. That is hy far the greateet gain which hae reeulted from thie modern evolntion of the horse.—*Exchange.*

THE INVISIBLE WORLD.—I am glad I live in the nineteenth centnry, when mysteriea are heing lifted, and every day multiplies the anologiee hetween science and religion, and we may hope to see the orown yet whioh glitters on the tripartite kingdom of science, religion and grace. Is there an invisible world? and do we enjoy our homes alone, or ie the air filled with loved ones and aerial heinge? Science eaye "Yes," and it depends upon the number of seneee we have whether we agree with science. Our minde are in prieons, from whioh they look out through windowe in the walls, and that mind which enjoya the greater ontlook mnet see more than others. Our preeent inahility to see angele is no argument against their exietence, ae what we know dependa upon the numher of our eensee. The windows of the houee in which we live are glazed or etained. We cannot aee or hear all. The dog accompanying ue through the foreet ecents the game of whioh we had no knowledge. The atmosphere ie populons with particles that elude the prism and the ecalee, yet they lend the sky its azure and dietrihute the eunheams over the earth. Sound consists in the movement of the air and the existence of an auditory nerve. The deaf are inensihle to thunder, yet it thunders. Negative scientific schools say they cannot find onr God anywhere! Does not their science teach them that there ia another world which neither scalpel nor microscope can explain or explore? Scientific men know that the atmosphere ie crowded with life germs, and is it too much to aek that we he permitted to helieve that hack of theee life germs higher livee and more distinguished organisme exist? Were our eare properly attuned, we might hear the atmosphere, now silent, musical with the tread of angel feet, and it may all come in good time. Do angele tread the air we hreathe?—*Rev. J. Sanders Reed.*

LUMINOUS WATER.—Ernest Fabrig, in the *Chemical Trade Journal*, narratee that, heing in a dark room, having in hie hand a sealed hottle partly full of a solntion of ozone water, he idly shook it np; whereupon a eoft phoephorescent glow of light floated ahove the surface of the water and pervaded the epace in the npper part of the hottle. The appearance was only momentary, hnt on shaking up the liquid again immediately afterward, the light reappeared, although in much diminished intensity. Further repetitions of the shaking failed to produce any results, but after an interval of ten daye the liquid had apparently regenerated its luminous power, for the eame effecte could he produced with it, although weaker. The phenomenon was afterward observed in another way, and some specially remarkahle results were ohtained hy pouring a small quantity of an ozone solution into a glass heaker containing ordinary water. At first the cone-like projection of the solution, where it falls into the water, hecomes luminous, and then the light snffuses the whole mass as the liquide hecome thoroughly mixed, finally dying away. It is described as a soft phosphorescent glow, which quickly spreads over the mass of fluid or gas, as the case may he, and as quickly disappears.

SCIENCE SENSES.—In the past 10 or 15 years there has grown np a need for special training of the senses, in order to use properly scientific instruments, not in study or in any way applying to it, hnt as necessary adjuncts of business communication in every-day life. First on the list will come the telephone. Most persone using one for the first time find themselves absolutely *hors de combat*, unable to recognize a familiar voice, and are only conscious of the most helpless hearing-deafness. After a short training the ear and mind adjust themselves with a wonderful nicety to the new duty required of them, and learn to recognize a voice as unerringly as though talking face to face with the individnal who is, perhaps, miles away. Following closely in the wake of the telephone, which may he looked upon as the pioneer of the inventions which will later rely upon the auditory nerves or hearing for their use, is the graphophone, a marvelous little machine, whose fitness for the work it has to do is so wonderful that, were it not explained on purely scientific principles of natural laws, man would think the inventor of it in league with the "Buyer of Souls." It records sounds hy the vihrations of the air acting on a steel stylus, which is so placed that it cuts or traces fine lines on a cylinder of rubber coated with wax. These lines are of varying depth, according to the force of the sound waves. The vihrations or sounds are reproduced hy the aforementioned cylinder heing revolved under a small stylus to which ie attached a pair of tiny ear trumpets which are so adjusted that they transmit with absolute fidelity every sound wave to the ear. It is impossible to predict the boundary line of scientific discoveries and the need to which man may put them in the near future.—*Scientific American.*

SLIME DEPOSITS IN WATER.—In storing "potable" water, in either ponds or tanks, there is nearly always neglect of means to cleanse the sediment deposited. Where such sediment comes from, especially in tanks fed hy springs, is not easy to determine; but that there is a deposit of from one to two inches of black slime each year is obvious enough. This slime is filthy in the last degree, and the water is spoiled. The sun has some strange effects in such cases. Covered tanks or pools do not become stagnant, or rarely do, while open ones without circulation are certain to hecome coated with a vegetable growth on the sides that is marvelous. This is especially true of artesian water when it is warm. At Stockton, a few weeks sniffices for a thick, green vegetable growth on the sides of the pools, which decays, falls to the hottom, and produces the black slime before mentioned. In the case of pools or reservoirs with sloping hottoms, there is an easy remedy hy providing a catch-hasin or pocket, with a "blow-off" outlet. There is always some risk in direct pipes to the hottom of a reservoir, hut the arrangement is common, and a service-pipe and blow-off, or cleaning pipe can he carried in together, the inlet of the former heing fixed above the catch-hasin or sump. Another way would he to put a siphon-pipe into the sump so that it could he cleaned to some extent without emptying a reservoir.

MICROBES IN HAILSTONES.—Bacteria of various kinds have heen found in snow and even in ice. Dr. Fontin, a Russian scientist, it is said, has demonstrated that hailstones are not free from them. He has found that the water from the melting of hailstones contains an average of 729 hacteria per cubic centimeter. Neither yeast fungns nor mold was present, but nine different kinds of bacteria were found. As the ordinary dwelling-place of the *Bacillus mycoides*—one of the species found—is the earth, it appears that microbes of terrestrial origin may he carried up into the air, and thus rain, snow and hail may he the direct means of conveying infection.

YEAST.—It was found some 50 years ago hy Cagniard, Latour and Schwann that the mysterious snhstance known to brewers as yeast or barm was really composed of a vast number of minute oval particles endowed with the powers of growth and multiplication, and therefore undoubtedly living.

SOURCES OF HEAT.—There are four principal sources of heat: (1) physical, (2) chemical, (3) mechanical and (4) physiological. The physical sonrces of heat are solar radiation, stellar radiation, terrestrial radiation and electricity.

FRESH-WATER SHARKS.—A naturalist claims to have discovered in the river approach to Lake Nicaragna, and in the lake itself, the only fresh-water sharks known.

THE EARTH is nearest the sun on the second day of each year, on which day she is only 90,822,000 miles from hie solar majesty.

ELECTRICITY.

The Rise and Progress of Electrical Science.

Some vague notions in regard to electricity existed even as far back as the time of Thales of Miletus, who lived about 600 years B. C. It seems to have been discovered about that time that the fossil gum, known to us as amber, upon slight friction possessed the peculiar property of attracting small objects to itself. The Arabs called the gum "karabe" or "catch-chaff;" while to the Greeians it was known as "elektron," from which name its peculiar property of attraction has since become known as electricity. Theophrastus, Aristotle and later the elder Pliny took much interest in the matter, which was, however, only regarded as something curious rather than useful, until about the year 1600, when Dr. Gilbert, an Englishman, took up the subject and began to treat it in a scientific manner with a view of the possibility that it might, at some time, be made of utility to mankind. He found that similar phenomena were connected with many other substances than amber. He also showed that they were even manifested in animals. He claimed that the similar phenomena connected with what are now known as electrical fishes, as the torpedo and those now known as animal magnetism, as exhibited in the cat and in man as well, were of the same nature as those first observed in amber. He also devised and exhibited many curious experiments which greatly interested the philosophers and other thinking men of his day. From that time to the present electricity has presented a peculiar field for scientific and technical research.

In More Modern Times

We have the researches and experiments of such men as Boyle, Guericke, Sir Isaac Newton and others; but it was our own Franklin who first proved that these phenomena were produced by the same subtle agency as that which causes the terrific commotion manifested in a thunder-storm.

Later we have the names of Faraday, Tyndall, Thompson, Morse and our own eminent countryman Edison, whose inventive skill in putting electricity to useful work leads all the rest. The first electro-magnet was made in London in 1825.

The First Electric Telegraph

Actually put into commercial use was put up in Munich by Prof. C. A. Steinheil in 1836; it was 12 miles in length. A single wire was used, grounded at both ends. The signals were sounds upon bells of different tones. A device was also invented by the same person which imperfectly traced lines and dots upon a ribbon of paper moved at a uniform rate, on the same principle as subsequently adopted by Prof. Morse. The next practical telegraph was put up in England in 1837 between Paddington and Drayton, a distance of 13 miles.

The first American telegraph was put in operation between Washington and Baltimore in 1844, by Prof. S. F. B. Morse, whose attention was first called to the matter and the principle of its working explained to him by Prof. Chas. T. Jackson. Prof. Morse subsequently worked out a far more practical device than any which had previously been presented to the world, and which has ever since continued to be generally acknowledged as the most effective and simple ever devised.

A Near Approach to the Electric Telegraph in 1747.

It has been said on what seems to be very good authority, that in 1747 Bishop Watson sent the discharge of a Leyden jar through 10,600 feet of wire suspended on poles on Shooter's Hill, and a plan for an alphabetical telegraph appeared in *Scott's Magazine* for 1753, which, however, seems never to have been realized in a practical manner. At Geneva, in 1774, a telegraph line was erected by Lesage, consisting of 24 pith ball electroscopes, each representing a letter. If either of these experimental attempts had been properly worked out and followed up, the world would have been in possession of the electric telegraph nearly a century before the invention of Prof. Morse.

The First Submarine Telegraph

Was laid by Samuel Colt—of pistol notoriety—from Coney and Fire Islands in New York harbor up to the city. The first laid in Europe was under the waters of the Rhine from Deutz to Cologne. The next was from Dover to Calais. All these were single wires insulated with gutta-percha. The next grand and important attempt was the connection of the American and European continents in 1857-58.

Who Was the Real Inventor of the Electric Telegraph?

Is a difficult question to solve. Prof. Morse is generally considered as most fully entitled to that honor, although, as hereinbefore stated, there were two lines at work in Europe before Morse perfected his invention and set it at work. But there is a history even before that, aside from the experiments of Bishop Watson above alluded to, made in 1747. In the year 1832, Prof. Morse was a passenger on board the ship Sally with Prof. Chas. T. Jackson of Boston, bound from Liverpool to New York. This, it will be noticed, was four years or more before the first telegraph was put in operation at Munich. During that passage much conversation was held between the passengers and Prof. Jackson, who was well known to be thoroughly conversant with the science of electricity as it stood at that time.

Prof. Morse, then quite a young man, was particularly interested in these conversations, although he knew but little or nothing of the science. During one of these dinner-table talks Prof. Jackson told the company that electricity would soon be introduced as a means of telegraphy, to take the place of the clumsy signals which were then in vogue, by flags and other means of sight, to convey words from one hill-top to another in view. The professor pointed out several ways by which it might be done. His plan, as he told it to the writer some 20 years ago, embraced the essential features of the Morse system as introduced by him some 12 years later. Mr. Morse was intensely interested in this matter, and just before his arrival in New York, asked Prof. Jackson to refer him to such persons and books as might enable him to study the general subject of electricity and also Prof. Jackson's views of its new application in particular. Prof. Jackson, two years later, constructed and successfully operated such a device as he outlined to Mr. Morse, and exhibited its working to Mr. Francis Alger and others of Boston. But it could not be successfully worked because up to that time no continuous electric current could be produced. The sustaining battery invented by Daniell in 1837, eventually furnished what was lacking to Jackson in 1834; but he had dropped the matter in the pursuance of other studies, while Prof. Morse laid down his brush as an artist and made his fortune by putting into practical use Jackson's device which was made possible by Daniells' invention.

The Recent Progress in Electricity

Is too well known to need any extended mention here. There are now 942 submarine cables, exclusive of the seven cables which span the Atlantic ocean. The land telegraph lines are almost without number. They have unrolled the wire reel without stint, and now measure nearly two millions of miles in extent of circuit. Outside of the telegraph and telephone, the applications of electricity to the various industries are almost without number. The figures which tell of its progress in that direction are absolutely bewildering. More than $600,000,000 are already invested in electrical industries in this country alone. These industries sustain at least 1,000,000 people. Moreover, the progress in this work has been attended by a steady decline in the cost of the electricity itself and all of its appliances and apparatus as well.

Since the announcement of the telegraph and the telephone there have been no announcements of startling inventions; but the progress in this field of work has been steady and forward all the time—never a drawback in any direction. The only thing that has appeared at all in the way of progress has been the dangers which have been incidental to its rapid progress—a progress so rapid that the people have not been able to keep up the needed education which must always follow in the wake of every important departure from the beaten track of progress. It has already entered into the shop both as a power and as a working element. It melts, it hammers, and it has proven the best welding device which has ever been introduced. As light, it is unrivaled.

It is supplanting or rather supplementing steam everywhere. It is the cheapest and most convenient carrier of power known. It is fast working its way upon the rail, and is destined to become the possibility by which extraordinary fast time in passenger and package transit can be attained. It has already entered the mine and is there to stay and spread.

In regard to its limitations or possibilities, who can tell? It is evidently the great agent by which the greatest difficulties in human needs and industries are to be solved in the most satisfactory manner.

USEFUL INFORMATION.

CONSUMPTION OF COTTON.—The *Commercial and Financial Chronicle* of New York makes a very exhaustive statement of the cotton crop of the United States for the year ending Sept. 1, 1890. In this centenary year, a conception of the extent of cotton culture will possess a particular interest. The total crop reaches 7,313,726 bales, while the exports are 4,916,847 bales, and the spinners' takings are 2,342 328 bales, leaving a stock on hand at the close of the year of 61,269 bales. The growth in the consumption of cotton by spinners becomes more notable from year to year. In 1868-69 there were only 5,000,000 bales of cotton manufactured in the world, against 11,000,000 bales at the present time, which indicates an increase of 120 per cent in the use of cotton for spinning purposes in 21 years. A still more wonderful expansion is found in the figures as revealed in the showing made in the last five years, which is the most wonderful in the history of the trade. In 1884-85, the total consumption by the mills was 8,597,000 bales of 400 pounds each, against 11,035,000 bales of same weight in 1889-90, showing an increase of 2,438,000 bales, or nearly 30 per cent in five years. In 1889-90, the world's consumption of cotton amounted to 11,965,000 bales, not including American cotton consumed in Canada, in Mexico, and burned. Of this quantity, the United States consumed 2,731,000, the continent 4 277,000, India 930,000, and Great Britain 4,027,000 bales. From the best information obtainable, it is found that there has been an addition in the South, during the past year, of 275,000 spindles and an addition of only 100,000 spindles in the North, making a total addition for the whole country, during the past year, of 375,000 spindles. The present number of spindles in the country is 14,550,000,000, of which the South has 1,725,000,000 and the North 12,825,000,000.—*Providence Telegram.*

A NEW USE OF THE PHONOGRAPH.—A new development of the use of the phonograph, which promises to bring the instrument into the field of practical medical science, has just been demonstrated. Mr. Ernest Hart lately suggested that the phonograph might with great advantage be employed to record the characteristic changes in voice sound which mark a variety of diseases. According to the *British Medical Journal*, this suggestion was acted upon, and Dr. Felix Semon consented to select from his patients at St. Thomas's Hospital a few cases in which pathological varieties of phonation were present. This was carried out with great success, and at a recent gathering, at which a considerable number of eminent men of the profession happened to be present, the phonograph reproduced the characteristic vocalization of some of these diseases with the most realistic effect. The whoop of whooping cough, with the intervening cries of the patient, were as vividly reproduced as if the child were in the room, and so also with the hoarse utterances of a case of stenosis of the larynx. The opinion was universally expressed that this new application of the phonograph to the purposes of diagnostic and clinical instruction constituted a solid gain for teaching, and probably for many other purposes. It will be possible to reproduce a series of cylinders capable of use in every medical lecture-room and clinical theater, which, at but little cost and without any difficulty, will afford to students and practitioners a lifelike reproduction of these characteristic sounds which no amount of mere word-painting can afford.

VARNISHED WIRE FOR ROOFING.—The *Stoves and Hardware Reporter* states that wire, covered with varnish, is being satisfactorily employed in cases where glass will not stand the vibration or other conditions. The transparent wire-wove roofing, which is translucent, pliable as leather and unbreakable, has for its basis a web of fine iron wire, with warp and weft threads about one-twelfth of an inch apart, this netting being covered on both sides with thick, translucent varnish, containing a large percentage of linseed oil. The process of manufacture is conducted by dipping the sheets into deep tanks, containing the composition, until the required thickness is obtained; the sheets are then dried in a heated chamber, and after being stored for some time, till thoroughly set, are ready for use. The sheets are made in any color, from amber to pale brown, and as the material readily adapts itself, when placed with ordinary skill, to curves and angles in roofing, and is unaffected by steam, the heat of the sun, frost, hail, rain or any atmospheric changes, it is likely to have a large application.

AN IMPROVED SEWING NEEDLE has been patented which secures the end of the thread in the eye, instead of having a running thread as in the case of ordinary needles. The eye of the needle is round or oval at the bottom, and tapers away chisel-shape at the top or head, thereby causing sufficient elasticity at the top of the eye to hold the thread perfectly rigid. This invention does away with all cutting of the thread, which is the case with ordinary needles where a running thread is used. The object of this invention is to allow the cotton thread to be easily passed through the hole and pulled up toward the head, so as to fix the thread in the chisel-shaped slit, and thereby prevent the thread from slipping out, as is the case with ordinary needles.

GOOD HEALTH.

About Expectoration.

Aside from being an exceedingly filthy habit, the custom of free and careless expectoration involves dangers to health which are not generally understood, but which are nevertheless in no sense fanciful.

It is well established that the poison of certain diseases appears in the expectoration. The germs of consumption are known to be minute, rod-like vegetable bodies, visible only by the aid of the most powerful microscope. In the matter expectorated by those afflicted with this disease the germs are met in large numbers. By experiment it has been determined that they are very tenacious of life, and can be destroyed only by certain fluids or by exposure to a high temperature for a considerable length of time.

It is easy to see, therefore, that if the expectoration from the lungs is allowed to lie exposed till it becomes dry, the germs will be taken up and scattered abroad by the air currents, and in this way a fruitful source of contagion will be provided.

Fortunately, most people in good health remain unaffected by the germs which have found entrance into the body. It is only when the powers of resistance are weakened by some defect of the constitution, or when some unusually favorable opportunity for infection has been given, that the poison gains a mastery and produces disease.

When we consider that in a hall of moderate size, which has been occupied by an audience for an hour or more, there are millions of germs of various kinds, some of which, under favorable conditions, are capable of producing disease, then the wisdom of such a provision of nature becomes apparent.

No doubt every one has felt a certain disgust at the hawking and spitting which is met with to a greater or less extent in all public places, and it is well for every one to know that there are excellent sanitary reasons for the observance of a rule which good breeding and a care for the feelings of others ought to be sufficient to enforce.

It is in the discovery of the real causes of disease that we shall most surely find the valuable means of prevention. If we must expectorate, let us at least refrain from doing so in public places.—*Youth's Companion.*

POWER OF THE IMAGINATION.—The Philadelphia *Times* tells how a dream of death was accurately carried out to the peaceful end. The story is as follows: A remarkable instance of the hold superstition has upon the mind of even the educated and religious was recently exhibited in the case of Mrs. Rebecca Byrnes of Helena, Ark., a lady noted for her intellectual attainments and pious life. One morning, rising in what seemed her usual health and spirits, she summoned her children to come to her. One son was residing in Topeka, Kan., one in New Orleans, two daughters were married and living in Sedalia, Mo.; but obedient to their mother's call, they came at once, though ignorant of the reason of their summons. When all were about her, the lady informed them that she had had a dream in which her husband, who had been dead for nearly 15 years, had warned her that she had only ten days more of life. She had sent for her children to bid them good-by, which she proceeded to do with much calmness, but with the air of one who had not the slightest doubt that she was already dying. Her friends attempted to reason with her and to point out the folly of placing such perfect confidence in a dream, but all to no purpose, for the lady persisted in asserting that she would depart from earth on such a day and exactly at a certain hour. Her pastor remonstrated with her and even brought the severest censure to bear on her superstitious credulity, and at last Mrs. Byrnes ceased to speak of the matter, so that her family had begun to think she had conquered her fancy. She continued in excellent health and pursued her usual daily life, but just before the hour she had predicted would be that of her death she sought her children and bade them good-by, then seating herself quietly in an arm-chair, expired just as the hour was struck. The physicians declare that her death was due solely to her imagination.

INTELLECTUAL WORK.—"It is not intellectual work that injures the brain," says the London *Hospital*, "but emotional excitement. Most men can stand the severest thought and study of which their brains are capable and be none the worse for it, for neither thought nor study interferes with the recuperative influence of sleep. It is ambition, anxiety and disappointment, the hopes and fears, the loves and hates of our lives, that wear out our nervous system and endanger the balance of the brain."

CREMATION is more extensively practiced in Italy than in any other country. The first crematory was established in Milan in 1876, and there are now 50 in operation in Italian territory.

SMALL HURTS.—A medical journal declares that a healthy man will actually suffer more from the prick of a pin than he would from the pains of dissolution in case he died a natural death.

Passing Events.

The weather—for this is now the subject uppermost in the California mind—the weather, then, he it observed, is not shaping itself quite to our liking. After nearly seven months of uninterrupted drouth, there was vouchsafed us in the early part of last week a couple of rains, wide extended and very welcome, but not over-abundant. This done, the weather relapsed into its old mood, illustrating in its peculiar way the force of long-continued habit. Meantime the grass has been started; also the plows, the surface of the ground having been sufficiently moistened for this. But vegetation proceeds slowly, the atmosphere being dry and cold; at the present writing, though not suffering from drouth, we would be the better of a little more rain.

During the behdomadal we are talking about, nothing of special interest has occurred in the mining world. As there are no big strikes, so are there no lamentable disasters to record, a fair amount of success with a gratifying exemption from accidents having attended the labors and the life of the miner.

Owing to the vigorous precautionary measures adopted by the military, the threatened Indian outbreak will no doubt be averted.

Operations on a reduced scale are to be resumed at the works of the Judson Manufacturing Company despite the late strike. The non-union men are being protected by the police.

There has just been completed at the Benicia Agricultural Works the largest traction engine ever built. It weighs 20 tons and will pull 40 plows going at a rapid pace.

Maria Price, a colored woman, died in this city four days ago, aged 106 years. She was born a slave but purchased her freedom in 1840, being then 55 years old. For the past 30 years she has resided in California.

The city of Chicago having appropriated the sum of $5,000,000 in aid of the World's Fair, the outlook for the great show may be considered auspicious.

It is by some suspected that the present visit of King Kalakaua to this country may have something to do with the question of annexing the Hawaiian Kingdom to the United States; meanwhile His Majesty remains noncommittal on that subject.

A Long-Neglected Duty.

Section 26, Article IV, of the Constitution of California contains the following clause:

"The Legislature shall pass laws to regulate or prohibit the buying and selling of the shares of the capital-stock of corporations in any stock board, stock exchange or stock market under the control of any association. All contracts for the sale of shares of the capital stock of any corporation or association, on margin or to be delivered at a future day, shall be void, and any money paid on such contracts may be recovered by the party paying it by suit in any court of competent jurisdiction."

As will be seen, the language of the above clause is *mandatory*. It does not say that the Legislature *may*, but that it *shall*, pass laws for the purpose mentioned. But no such laws have ever been enacted by the Legislature of this State, notwithstanding that body has held four sessions since the Constitution containing the above clause was adopted. Whatever the cause of this remissness, certain it is the framers of the Constitution as well as the people who adopted it expected that laws of this kind would in due time be passed. Had this not been so, there is little doubt but the convention that prepared the Constitution would have engrafted upon it a provision designed to compass the end contemplated; just as they did in the same clause declare that all contracts for the sale of shares on margin or to be delivered at a future day shall be void, and any money paid thereon be recoverable in a suit brought in any court of competent jurisdiction, and which is now the law of the land, no legislation having been required to give this clause of the Constitution effect.

As our Legislature is soon to convene, we take occasion now to call the attention of the members-elect to this oversight, hoping they will see that this mandate of the Constitution is complied with. We have already a statute prescribing the duties of the trustees of mining companies and the rights of shareholders. Let us now have a statute regulating or prohibiting this business of buying and selling the shares of corporations in stock boards subject to the control of any association.

What action the Legislature should take in the premises is not for us to say. All we insist upon is that such action be taken as the Constitution requires. Our law-makers may, if they deem it expedient, prohibit this class of transactions altogether, there being warrant in the Constitution for their doing so, or they may in the way of "regulating" these associations offer a bonus for those transacting the largest amount of business annually. They had better consult their constituents on this point. Public opinion is always a safe guide in these matters. It is never safe, however, to set at naught the clearly expressed purpose of a Constitutional convention. If the members of the Legislature cannot see their way to a suppression of these stock operations, let at least enough "regulating" be done to show a decent respect for the fundamental law of the land.

ELECTRIC PLOWING.—An installation for the purpose of plowing the land by electric motors has been set up on property belonging to the Marquis de la Laguna of Spain. The power of a water-wheel of about 20 H. P. will be employed, and the implement for working the land is expected to work at a distance of three miles from the generating dynamo. A deficiency of mechanical and agricultural knowledge on the part of those intrusted with the work seems likely to make this trial a failure.

THE German East Africa Company has issued 150,000 silver rupee pieces for circulation in East Africa.

Gold Mining in the Older States.

They talk flippantly of gold mining in the Southern States. Every now and then we read the announcement that a company has been formed in New York, London, or elsewhere, for the purchase, opening up and equipping of a gold mine in Virginia, North Carolina or Georgia. The capital provided for this purpose is large. It is divided into many shares, which are offered investors at tempting figures—that is, if the value of the property as set forth in the company's prospectus may be accepted as conclusive on that point. From the manner in which these companies start out and the preparations made, the uninformed would be led to think that a great production of bullion was soon to follow. Dividends commensurate with such production would, of course, be looked for.

But behold the outcome! For the measurement of this, it does not, as some might be led to expect, require many millions. A few thousands suffice to cover values produced. In the three States mentioned, which cover the principal gold-bearing localities east of the Mississippi, the yearly product of bullion amounts to less than half a million dollars, the output of the companies operating there averaging hardly more than $20,000. In other words, these three States in such close proximity to the great money centers, aided by so much capital and enjoying the advantages of cheap transportation, labor and machinery, turn out only about half as much bullion as any one of the larger mines on this coast.

The truth is, the gold is not there; and such being the case, these companies are not to be censured for the meager results obtained. A small showing of the precious metal goes a long way in these countries. On it great hopes are built and big enterprises undertaken. Moreover, it is the case, if reports may be accredited, that there is something exceedingly misleading in the appearance of much of the gold found there. In certain parts of North Carolina, the quartz obtained is said to be coated with a thin film of gold. This, while it pleases the eye, is very deceptive, the body of the stone containing little or no gold. Trusting to these alluring appearances and the tests made by an incompetent or careless expert, a New York company put up costly machinery to work this ore, which under the stamps yielded an average of only $1.41 per ton, which necessitated the abandonment of the enterprise after a large sum had been expended in the fruitless endeavor to make it a success.

At Dalonaga, the principal gold-field of Georgia, nearly all the water available for washing is owned by a single company. This precludes extensive operations in that locality, which, even if water were plentiful, could make no large production, the diggings being comparatively poor and of limited extent.

Clearly the world has not much to expect in the way of gold supply from the States named or any other of the "old original thirteen." Farther west must the nations look for substantial aid in this particular. Here, where it takes over a hundred millions to represent the annual output of our mines, must they come for the bulk of their gold and silver as well as for much of their lead and copper, not to speak of the products of our forests and fields coming in to so largely supplement the product of our mines.

MORTALITY AMONG MINERS.—There are undoubtedly good grounds for carefully investigating the causes for the high rates of mortality among Cornish miners shown by the statistics published by the Registrar-General, says the Levant *Herald*. It appears that since the year 1862 there have been 12 great colliery disasters, causing in the aggregate no fewer than 2293 deaths, in connection with which £402,022 was raised by public subscription. No parallel disasters have occurred in the tin and copper mines of Cornwall, and it is obvious that but for this exceptional fatality the mortality among coal miners would have compared still more favorably with that of the Cornish miners. It is true that the death rate from violence among Cornish miners is twice as high as among all Cornish males, but this proportion is far below that which prevails among coal miners. The approaching census will once more afford the means for calculating the varying rates of mortality that prevail among persons engaged in different occupations, and it is to be hoped that this important matter will again be subjected to careful investigation and analysis. This would appear to be the only satisfactory manner for testing the assertions of the Government and of its mining inspectors, that the unfavorable conditions under which the mining industry was prosecuted in Cornwall no longer exist or have been very materially improved. If such has been the case, the mortality statistics, when next they are calculated, will stand out in striking contrast to those to which we recently referred.

Present Status of Gold and Silver Mining.

It is not rendering the mining industry a kindly service to speak of it in terms of unqualified praise or extravagantly hopeful. It is a business beset with obstacles and inherently difficult. It calls for all the economy, skill and care requisite to success in any other calling, results even then being often disappointing. This need not be insisted upon. Our experience proves as much. As every mining camp has its cemetery, so also has every mining camp its industrial graveyard.

But for all this, the present status of gold and silver mining compares favorably with that of any other, even the most successful of our leading pursuits, nor is its past history more fruitful of disaster than theirs. This business stands to-day more entirely on its own bottom than manufacturing, trade or farming. This class of miners are not alms-seekers. They are not among those who are clamoring for Government aid, nor are they otherwise suppliant for special favors. They do not desire to be fed from the public crib. They do not want the Government to advance them money at the rate of two per cent on their mines nor on the product of these properties. That has been left for the northern grain-grower and the southern planter.

It is the bankers who fail and cheat their depositors, and the merchants who make assignments for the benefit of their creditors, the latter doing well if they get twenty cents on the dollar. It is the manufacturers who are in straits, not the miners. It is the countries where there are no mines of this kind that are financially distressed and from which we on this side hear the cry, "Come over and help us." In the Middle and Far West, where they mine for the precious metals, there is no such distress, though they manufacture but little. There are here no sweeping failures and but few assignments. There is here but little of that perturbation and excitement experienced in other lands, and this chiefly because we enjoy the blessings incident to this most solid, stable and enduring industry. Mining for gold and silver, purified by its trials and purged of its abuses, stands to-day the model industry of the age, the best exemplar of American skill, energy and enterprise extant.

Watchman, Tell Us of the Comstock.

What Its Signs of Promise Are.

Querist, o'er you mountain hight see that dim, misguiding star and you will gain all the light vouchsafed the watchman or other outsider on this bewildering and oracular subject. Judging from what seems to be going on here in San Francisco, there impends a boom in the shares of the great Washoe lode. About the pool speculative are to be seen many waiting for the angel to come down and stir the waters, when they hope to step in and be cured of the financial itch and other ailments that afflict, and the anxious-seat in the Temple of Mammon appears also to be filling up mostly with old mourners who, sick and decrepit, have been there before.

Because the prices of stocks are depressed, it is not to be inferred that the bottom has fallen out of the mines, but the rather that something valuable is likely soon to be revealed there. The actions of the adroit manipulator are to be construed by the rule of contraries. He hears the market when he would load up, and boosts it when he would unload. Writing of him in strain Hudibrastic, it may be said:

> "He greatly resembles the skillful rower
> Who looks one way and pulls the other.
> So sell your shirt and buy some shares,
> Jump in with the 'bulls' and 'bears,'
> And trusting to a lucky stroke,
> Make your fortune or get broke."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 2, 1890.

442,003.—BOOT-CALK—A. J. Armstrong, Coronado, Cal.

442,006.—CRUSHING-ROLL.—H. C. Behr, S. F.

441,863.—NIGHT DIRECTORY—Henry Bergstein, Reno, Nev.

441,937.—BURIAL APPARATUS—G. H. Clark, Sacramento, Cal.

441,869.—HOOP-COUPLING—L. R. Fulda, S. F.

441,871.—FRUIT-DRYING TRAY — Hammon & Sechrist, S. F.

442,088.—DOSE-MEASURING BOTTLE — H. S. Herrick, S. F.

441,763.—VAPOR BURNER—C. W. Ingraham, Eight Mile, Or.

441,690.—FUMIGATOR—A. McLain, San Diego, Cal.

441,965.—PROPULSION OF VESSELS—S. A. Owen, West Berkeley, Cal.

441,862.—STEAM BOILER—J. & W. Paterson, Stockton, Cal.

441,859.—FRUIT-GATHERER — Florian Stanke, S. F.

441,861. — COIN-ACTUATED LIQUID-VENDING MACHINE—Vansant & Eames, Dixon, Cal.

The following brief list by telegraph for Dec. 9, will appear more complete on receipt of mail advices:

California—Almon Ames, Berkeley, assignor to R. J. Davis, San Francisco, machine for turning and preparing piles or spars; Walter M. Axtell, Fruitvale, railway crossing; Joseph Budde, San Francisco, supply valve for water closets; Adam Harpold, Colton, tree transplanter; David B. James, San Francisco, miners' candlestick; Joseph B. Jardine, San Francisco, apparatus for reducing, laying and rolling bituminous rock, asphalt, etc.; William H. Leavens, San Francisco, door-opener and closer; Duncan F. McDonald, Berkeley, device for adjusting window curtains; William F. Murray, San Francisco, portable hoisting mechanism; David Stark, San Francisco, feed-water heater. Oregon—Samuel T. Harrison, Skipanon, dressing and thread-cutting tool; Matthias Jensen, assignor of one-half to Jensen Canfilling Machine Co., Astoria, can body-making machine; George H. Williams, assignor of one-half to R. D. Montague, Albany, car-coupling. Washington—Otto F. Wegner, Seattle, shelf support.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

COIN-ACTUATED LIQUID-VENDING MACHINE.—William Sherman Van Sant and Edmund Curtis Eames, Dixon, Cal. No. 441,861. Dated Dec. 2, 1890. This machine is one from which, upon the deposit of a suitable coin, a certain article is delivered. The object of the machine is to provide for the keeping of one or more beverages, a tumblerful of any one of which will be delivered to the customer upon the deposit by him of a proper coin. The machine coosists essentially of one or more vessels for containing the liquids, a tilting measuring cup for each vessel, into which the liquid is conveyed by means of an automatically operating pipe connection, a discharge funnel to receive the contents of the tilting measuring cup, and an electrically operated catch for holding and tripping the tilting cup, the electric mechanism being set in operation by the deposit of the coin.

STEAM BOILER.—James Paterson, Stockton, and William Paterson, Benicia, Cal. No. 441,852. Dated Dec. 2, 1890. This invention relates to certain improvements in steam boilers, and consists of horizontal and vertical sections detachably connected together, a means for supplying the feed-water through the vertical section to the horizontal one, and a supplemental connection between the two whereby water may be supplied in case of temporary failure of the feed-water apparatus,

FRUIT-DRYING TRAY.—Wendell P. Hammon, Oaklaod, and Charles J. Sechrist, San Francisco, Cal. No. 441,871. Dated Dec. 2, 1890. This tray consists of a frame having a perforated paper bottom and a spring-actuated bar for holding the bottom in place. The paper bottom rests upon a wire netting or frame. The perforations in the bottom permit free circulation of air, and the fruit will be dried both from above and below. When soiled, the paper bottom can readily be removed and another substituted.

HOOP-COUPLING. — Lamartine R. Fulda, San Francisco, Cal., assignor of one-half to Edward Fulda, of same place. No. 441,869. Dated Dec. 2, 1890. This is an adjustable coupling for tank hoops. It consists of a clamp formed of screw-eye bolts bent and connected in such a manner that the ends of the hoop may be attached to it, and whenever the hoop becomes loose it may be tightened by screwing up the clamp. There are two screw bolts, each having one end threaded and the other bent at right angles and formed with an eye to receive the threaded end of the opposite bolt, the bent ends being adapted to pass through and hold the looped ends of the hoop.

NIGHT DIRECTORY.—Henry Bergstein, Reno, Nev. No. 441,863. Dated Dec. 2, 1890. The object of this invention is to provide a directory adapted for the use of physicians, whereby their presence or absence from the house may be made known to the caller at night without requiring him to disturb the household to learn such fact, and also to better indicate the position of the night-bell and to give an opportunity to leave such orders as may be necessary. It consists essentially of a transparent slate adapted to be written upon, and illuminated by a source of light from a point back of it. The intervening and changeable placards are also translucent and illuminated.

FRUIT GATHERER.—Florian Stanke, San Francisco, Cal. No. 441,859. Dated Dec. 2, 1890. This device belongs to that class of pruning shears and fruit-pickers or gatherers in which the shears are fitted to the end of a long pole, and are adapted to cut the branches or stems of the fruit, the fruit then dropping into a hopper on the head of the pole directly underneath the shears, and is directed by a suitable conveyor to a receptacle below. The object of this invention is to provide a device of this character which is adapted to cut fruit conveniently, no matter in what position it may be located, and to convey it below without bruising it, and also to provide a shears not only adapted for the picking of fruit, but for general pruning purposes. The essential improvement lies in the shears, which are formed with opposing jaws in line with the handles, and a second set of opposing jaws extending from the ends of the first jaws and at an angle therewith. This peculiar construction enables the shears to reach both horizontal and vertical stems conveniently. The mouth or hopper of the conveyor is made with a barred or grated open front, so that the operation of the shears may be readily seen. The conveyor itself has a tortuous passage which serves to break the fall of the descending fruit.

A Government Spraying Device.

B. T. Galloway, Chief of the Division of Vegetable Pathology, U. S. Department of Agriculture, has devised an apparatus for spraying plants which need the application of fungicides or insecticides. Although it seems a small affair from a California point of view, and though the Californian would object on principle to packing on his back the bug and fungus medicine, the arrangement may prove of much value to our people who have to deal with diseases or insects affecting vines, nursery stock, garden plants and other low growths which can be best reached by a man walking among them. Apparently because of the large need for such application at the East, what is called the "knapsack sprayer" seems to best answer the demand. In this State the larger outfits, so contrived that the horses can move the weight, leaving the men free to handle the nozzles, will not only be used for work among trees, but will also be employed among vines and wherever else it may be practicable. Still the hand machine has important uses, and we publish the device of Prof. Galloway because it is public property and any one is at liberty to manufacture it for private use or for sale.

THE KNAPSACK SPRAYER IN OPERATION.

The figure shown herewith will give a very good idea of the apparatus in use. It will be seen that there is a pump connected with the apparatus which is contained within the reservoir and worked by the right hand while the nozzle is held in the left. The reservoir will contain about six gallons of any kind of mixture which it may be desirable to use, which is about as much as any ordinary man will care to handle. The entire weight of mixture and apparatus, when the reservoir is full, is about 50 pounds. This weight may be reduced by placing less liquid in the reservoir. It is not necessary that we should illustrate or go into any detailed description of the construction of this apparatus. It is sufficient to say that it is perfect and effective in operation and simple and durable in construction.

Recent Additions to the State Mining Bureau.

Lead ore, Thompson mine, Old Woman's Mountain, San Bernardino Co., Cal.

Gold quartz with free gold, McGowan mine, Mineral Township, Plumas Co., Cal.; S. S. Taylor.

Gold quartz (auriferous arsenical pyrite), North Star mine, Amador Co., Cal.; Dr. Boyson.

Gold quartz with free gold, Halstead mine, Rich Gulch, Plumas Co., Cal.; S. S. Taylor.

Manganese ore (pyrolusite), near Freestone, Sonoma Co., Cal.; W. J. Woodley.

Three specimens silver ore, one from each of the following mines: The Excelsior, the Mayflower and the Keystone, San Bernardino Co., Cal.

Electrum, Liberia, Africa; J. Z. Davis.

Two specimens Molave wood, very rare.

Marcasite (sulphide iron), variety "spear pyrite" on serpentine, Napa Co., Cal; H. Gesford.

Aluminum bronze, al., 10 per cent, cop., 90 per cent, said to have been made at Lockport, N. Y., by the Cowles Co., in 1885, by fusing granulated copper with crushed corundum by electricity; W. P. Lyle.

Silver ore, Moulton mine, Butte, Montana; C. L. Canfield.

Ore with native silver from the Butte & Boston mine, Butte, Montana; C. L. Canfield.

Sphalerite (sulphide zinc), Butte, Montana, C. L. Canfield.

Two specimens silver ore from the Noonday and the Attica mines, Resting Springs District, San Bernardino Co., Cal.

Specimens silver ore from the Holland mine, Holcomb valley, San Bernardino Co., Cal.

Horn spoon, made by Indians of British Columbia; J. Z. Davis.

Adz or chisel of black slate, made by Indians of British Columbia; J. Z. Davis.

Pyrrholite, magnetic pyrite with traces of copper and nickel, large deposits on Elk Ridge, Humboldt Co., Cal.; J. B. Brown.

Spear head of chert, Cape Smith, Alaska, with various curios, utensils and Esquimaux implements, from the same locality; F. Cotto.

Gold quartz from croppings and upper ledge of the Gold Mountain M. Co., near Amador City, Amador Co., Cal.; J. L. Goodman.

Liparite tufa, Calistoga, Napa Co., Cal. (Calustro rock) gold quartz, Duncan mine, Hornitos, Mariposa Co., Cal.; J. B. Brown.

Ferruginous concretions, with a rude carving, probably an Indian amulet, Taylor mountain, near Santa Rosa, Sonoma Co., Cal.; J. R. Stanley.

Slate, silicious, somewhat resembling novaculite, makes a good whetstone, Kings Island, Behring's Straits; F. Cotto.

Gold quartz showing free gold, Fred Lewis mine, Rich Gulch, Plumas Co., Cal.; S. S. Taylor.

Gold quartz showing free gold from an old placer mine near the Veragua river, Isthmus of Panama, worked before the discovery of this continent by Columbus, who entered this river on his fourth voyage in 1503, and visited these mines, it being from this event that he obtained his title of Duke of Veragua; W. P. Lyle.

To some of the above articles there attaches a special interest because of their intrinsic value, their rarity or their utility. The fragment of silicious slate brought from Behring's Straits, constitutes the first rock found on the west side of the continent suitable for making whetstones, or at least the first of which samples have been received at the Mining Bureau, this being especially well adapted for that purpose,

Importance of Gold Mining in California.

EDITORS PRESS:—Your article giving the estimated valuation of the annual products of the mines in California was so highly appreciated that it appeared in most of the papers in the county. But few were aware that the mining industry was still so valuable and extensively conducted or that so great a number were engaged in the business. The estimate conclusively shows that mining still contributes immensely to the revenue of the State and that it must be a remunerative and profitable pursuit. The fact is, this branch of industry and source of wealth is not receiving the attention and encouragement it so justly deserved.

Of late years the planting and cultivation of orange groves, orchards and vineyards has so completely absorbed the minds of the people and that of the press that the first chief cause of the State's prosperity is at present overlooked. In this county there should be hundreds, if not thousands, of good producing mines instead of the comparatively few we have, and there certainly would be if capitalists at home and abroad were suitably advised or could be induced to visit the gold-bearing districts and see for themselves what is being accomplished by the present methods of mining, its future prospects and possibilities.

It is believed that in this and adjoining counties where valuable mines are now being worked, there are extensive and rich gold-bearing regions, that remain undeveloped simply for the want of water or some other agency or device capable of working them.

A new system of mining, called the Freedman's "dry process," is being erected near Iowa Hill. The work will be completed some time next spring, when the "dry process" for extracting the gold from the gravel will be in full operation. Should it prove a success, large quantities of water will be no longer required, so that capital and labor need not be confined to any particular locality, but go wherever the precious metal can be found or is known to exist.

To-day there is probably no more important or valuable industry in the State than that of mining, if properly conducted. To be sure, there are some failures, as there are in other pursuits, but it is to be found generally attributable to the want of capital or experience to carry it successfully on. Hereabout, there is every indication that a renewal of interest in this industry will soon take place. N. S. T.

Auburn, Cal., Dec. 5th.

The Population of the United States.

Robert P. Porter, Superintendent of the Census of 1890, has issued a preliminary bulletin of census results from which we take the following table showing the population of the United States in 1890, as compared with 1880 and 1870, by States and Territories. The figures for 1890 in this table are not final, but are subject to revision:

STATES AND TERRITORIES	POPULATION 1890.	1880.	1870.
The United States	62,480,540	50,155,783	38,558,371
North Atlantic Division	17,364,429	14,507,497	12,298,730
Maine	660,261	648,936	626,915
New Hampshire	375,827	346,991	318,300
Vermont	332,205	332,286	330,551
Massachusetts	2,233,407	1,783,085	1,457,351
Rhode Island	345,343	276,531	217,353
Connecticut	745,861	622,700	537,454
New York	5,981,934	5,082,871	4,382,759
New Jersey	1,441,017	1,131 116	906,096
Pennsylvania	5,248,574	4,282,991	3,621,951

California	1,204,002	864,694	560,247

b The number of white persons in the Indian Territory is not included in this table, as the census of Indians and other persons on Indian reservations, which was made a subject of special investigation by law, has not yet been completed.

c Including 5337 persons in Greer county (in Indian Territory) claimed by Texas.

d The number of white persons in Alaska is not included in this table, as the census of Alaska, which was made a subject of special investigation by law, has not yet been completed.

EDWARDS' WORKS ON THE STEAM ENGINE.

The American Steam Engineer, Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the use of Engineers, Machinists, Boiler Makers, and Students. By Emory Edwards, M. E. Illustrated by 77 engravings. 12mo, 419 pages.....$2.50

Modern American Marine Engines, Boilers, and Screw Propellers. Their Design and Construction. Showing the Present Practice of the most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to.....$5.00

The Practical Steam Engineers' Guide in the Design, Construction and Management of American Stationary, Portable, and Steam Fire Engines, Steam Pumps, Boilers, Injectors, Governors, Indicators, Pistons and Rings, Safety Valves and Steam Gauges. For the use of Engineers, Firemen and Steam Users. Illustrated by 119 engravings. 420 pages, 12mo.....$2.50

A Catechism of the Marine Steam Engine. For the use of Engineers, Firemen, and Mechanics. A Practical Work for Practical Men. Illustrated by 63 engravings, including examples of the most modern engines. Fifth edition, thoroughly revised, with much new matter. 12mo, 414 pages.....$2.00

Modern American Locomotive Engines. Their Design, Construction and Management. Illustrated by 78 engravings. 12mo, 383 pages.....$2.00

☞ *The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.*

☞ *Illustrated circulars, showing full tables of contents of all of the above valuable books, will be sent free to any one in any part of the world who will send his address.*

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 84 pages, 8vo, as well as our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts sent free and free of postage to any one in any part of the world who will furnish his address.*

A NEW BOOK ON ASSAYING.

THE BEST IN THE ENGLISH LANGUAGE.

IT LEADS ALL OTHERS!

RECENTLY PUBLISHED.

THE ASSAYERS' MANUAL.

An Abridged Treatise on the Docimastic Examination of Ores, and Furnace and other Artificial Products. By BRUNO KERL, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent office, Berlin. Translated from the German by WILLIAM T. BRANNT, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. LYNWOOD GARRISON, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo. cloth, price $3.00. *By mail, free of postage, to any address in the world.*

Abstract of Contents: GENERAL DIVISION.—I, Mechanical Manipulations; II, Chemical Operations; III, Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth; XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium; XVI, Tungsten; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuel; Appendix; Index.

☞ *A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will apply.*

☞ *The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 86 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut burred and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

WM. H. CONLY,
Lands, Mining and Commission,
124 SANSOME STREET,
Rooms 21 and 22,
Telephone No. 5057. SAN FRANCISCO.

TUBBS CORDAGE CO.
(A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.

611 & 613 Front St., San Francisco, Cal.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

268 Market St., N. E. cor. Front (up stairs), San Francisco
Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

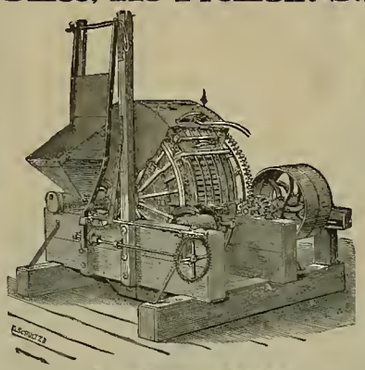
FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.

—MANUFACTURERS OF—



TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

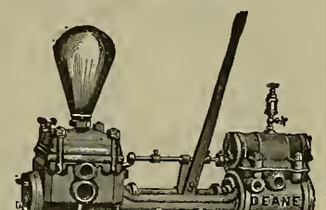
MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.



DEANE STEAM PUMP.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE, which contains **94 per cent of Nitro-Glycerine,** and **GELATINE-DYNAMITE, Stronger than Dynamite** and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Iron and Machine Works.

UNION IRON WORKS,
SACRAMENTO, CAL.
ROOT, NEILSON & CO.,
MANUFACTURERS OF
Steam Engines, Boilers,
AND ALL KINDS OF
MACHINERY FOR MINING PURPOSES.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Between Mission and Howard, SAN FRANCISCO.
GAS WORK A SPECIALTY.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHEOK SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

A. S. GRANT. S. B. CONNOR

CONNOR & GRANT,
Millwrights and Engineers
303 CALIFORNIA STREET,
Rooms 30 and 31, SAN FRANCISCO, CAL.

Designers and Constructors of Gold and Silver Mills Hoisting and Pumping Works, Tramways, and everything pertaining to the Mining and Reduction of Ores.

Bewick, Moreing & Hooper,
MINING ENGINEERS,
508 California Street, San Francisco, Ca
Suffolk House, Laurence, Pountney Hill,
LONDON, E. C.
Leake's Buildings, Johannesburg,
SOUTH AFRICA.
Report on mines and undertake management of mining properties.

RICHARD R. HAWKINS,
MINING ENGINEER.

LATE ASSISTANT GEOLOGIST U. S. GEOLOGICAL Survey. General Manager La Velera (Limitada), via Torres and La Barranca, Sonora, Mexico.

W. A. GOODYEAR,
Civil and Mining Engineer,
MINING EXPERT AND GEOLOGIST.
Address "Business Box A," office of this paper, San Francisco.

ROSS E. BROWNE,
Mining and Hydraulic Engineer,
No. 307 SANSOME ST., SAN FRANCISCO.

QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly (through oversight or other mishaps) do us the favor to write again.

AMALCAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrifugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Retorts, Gullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved White's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish Crushing and Finishing Rolls, Hartz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Slime Tables. Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❋ BOILERS HORIZONTAL, VERTICAL ... AND SECTIONAL. ...

IMPROVED STEAM STAMPS

Hoisting Engines, Safety Cages, Safety Hooks,

ORE CARS, WATER & ORE BUCKETS,

Air Compressors, Rock Drills, Etc.

GENERAL MILL AND MINING SUPPLIES, ETC.

Sectional Machinery FOR MULE-BACK TRANSPORTATION.

Pumping Engines and Cornish Pumping Machinery,

IMPROVED WATER JACKET

Blast Furnaces for Galena & Copper Ores,

SLAG CARS AND POTS,

Roots & Baker Pressure Blowers,

SUSPENDED TRAMWAYS.

General Offices and Works: FULTON AND UNION STS., CHICAGO, ILL.

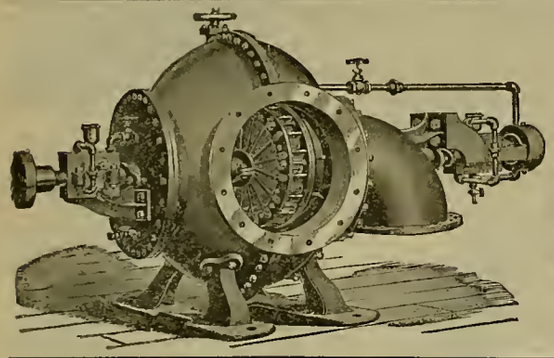
HELENA, MONTANA, Room 28, Merchants' National Bank Building, No. North Main St.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO.,
Springfield, Ohio, or 110 Liberty St., New York

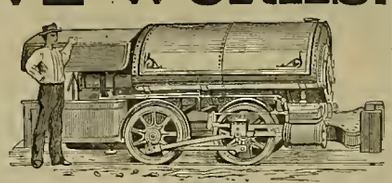
FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 800. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!



Adapted to every variety of service, and built accurately in standard gauges and templates. Like parts of different engines of same class perfectly interchangeable.

Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

BURNHAM, PARRY, WILLIAMS & CO., PROPRIETORS, PHILADELPHIA, PA.

CLAYTON AIR COMPRESSORS

For Working Rock Drills, Coal Cutters, Hoisting Engines and Water Pumps in Mines and Tunnels, Sinking Caissons, Etc., Etc.

SEND FOR CATALOGUE No. 6.

Clayton Air Compressor Works,
43 DEY ST., NEW YORK.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH MF'G CO., 9 Nassau Street, Rockford, Illinois.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

The Best Mining District
On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is THE TIDINGS.

Daily and Weekly edition. Gives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, $6.00 a year; WEEKLY, $2.50, *in advance*.
H. S. SPAULDING, Publisher.
T. C. HOCKING, Editor.

DEWEY & CO., PATENT AGENTS, 220 Market St., San Francisco. Elevator, 12 Front St.

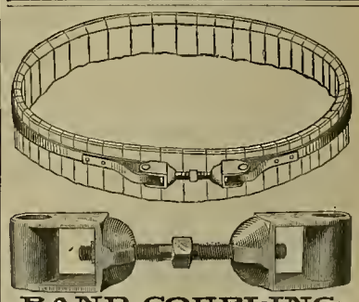
(Formerly Huhn & Luckhardt,
Mining Engineers and Metallurgists



BAND COUPLING.
Malleable Iron. All Sizes.

These Couplings are the best in the world, most powerful and cheapest. They have a ball and socket joint, right and left screw and work freely. We use them extensively in our Tank Building Department.

WELLS, RUSSELL & CO.,
Mechanics' Mills, Cor. Mission & Fremont Sts., S. F.

WINCHESTER HOUSE,
44 Third Street, - San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT AND COLD BATHS FREE.

Terms, Board and Room, $1.00 per Day
And Upward.

Rooms with or without Board,
Free Coach to the House,
J. POOLEY.

Postmasters are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap), do us the favor to write again.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 11, 1890.

General trade is quiet, with no improvement looked for until after the turn of the year. The local money market, while reported close, is not working with as much friction as it did in December of last year. The stringent money market at the East is not having as much influence on ours as would naturally be supposed when the close business relations are considered. From the best information obtainable, we unhesitatingly affirm that the disbursements of funds in this city next month will be the largest on record; and as the money goes into circulation, more general ease will result. Leading Eastern financial papers are of one accord in stating that the disbursements at the East will be very heavy, and that the gold now hoarded to meet the payments will be circulated soon after January 1st. Besides this, it is quite likely that public opinion will force Congress to stop partisan or political legislation and come to the relief of the country by passing a free-coinage silver bill.

The British steamer Gaelic, hence Dec. 6 for Hong Kong, took out the following treasure: Mexican dollars, 328,797; gold coin, $39,882; gold dust, $1070.

SILVER—Offerings, purchases and prices paid so far this month are as follows:

Date	Offered ounces.	Purchased ounces.	Price paid per ounce.
December 1....	891,000	566,000	$1 0075 to $1.0760
December 3....	1,301,000	321,000	1.0545 to 1.0595
December 5....	1,080,000	255,000	1 0400 to 1.0500
December 8....		685,000	1.0280 to 1.0350
December 10....	783,500	395,000	1.0300 to 1.0447
Total	2,222,000		

Adding purchases over the counter, it is altogether likely that a little more than half of the monthly requirements has been bought. Silver, after selling down below $1.03 an ounce, appears to be on the upgrade. The general impression that a free-coinage bill will be passed by this Congress has a favorable influence on the market, as has also the selling out of weak holders of silver. The production of silver in this country is not as large as many believe—the silver bill now in force did not prove as effective in reviving the mining industry as its authors had been led to look for. The silver men at the East, headed by Gen. Warner, Hon. F. G. Newlands, Edward Curtis and other staunch bimetallists, are leaving no stone unturned to bring about the passage of a free-coinage bill before Congress adjourns. It now looks as if they will be successful. In our next week's issue we will probably be better informed on the situation and can write more correctly on the outlook.

London cables report silver selling at 48d, against 47¾d yesterday.

MEXICAN DOLLARS—Trading has been fair. The belief that Congress will legislate still further in the interest of silver is causing more buying. The market is quoted at 82½@83c.

QUICKSILVER—Receipts the past week aggregate 150 flasks. The market is quiet but steady.

LIME—Receipts the past week aggregate 4923 bbls. The demand continues exceptionally good for the time of the year. Exports by sea the past week aggregate 800 bbls. to Honolulu.

BORAX—Receipts the past week aggregate 210 ctls, and shipments by sea 373 ctls to New York. The market is quiet but firm.

LEAD—The market is still shading off. Those who bought some time ago, in expectation of higher prices after the McKinley bill went into effect, have lost money.

TIN—The local market is dull and heavy. It now looks as if Congress will reduce the tariff on plate and continue pig on the free list. The market for pig abroad has been shading off. The buying of plate for this city is about over.

CHROME ORE—Exports the past week aggregate 295 tons to New York. The market is steady.

COPPER—The exports by sea the past week aggregate 196¼ tons of matte to New York. The market has shaded off some both in New York and abroad. The decline is due more to outside holders selling owing to the stringency in the money market, than to any other cause. The visible supply is steadily decreasing, which, with all else being equal, should bring about higher prices.

IRON—The local market is steady. It is stated that the quantity on the way from England is very large, which causes buyers to be offish.

COAL—Imports the past week aggregate as follows: Nanaimo, 7465 tons; Seattle, 6921; Port Townsend, 1050; Kobe, 2150; Cardiff, 1698; Coos Bay, 700; Wellington, 1340; Tacoma, 8950; total, 30,274 tons. The quantity of coal on the way from England to this port is unusually large. Vessels loading coal in Australian ports for this city are receiving quick dispatch. A good deal of Japan coal is on the way. With so much foreign coal on the way, coast collieries are disposed to send all the supplies to this city they can so as to take advantage of present high prices. Cold weather has increased the consumption. Australian coals on the way from Newcastle, N. S. W., can be bought at $8, while for shipment loaders' prices are named.

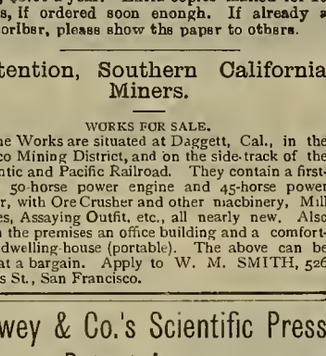
WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

Dewey & Co.'s Scientific Press Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 64 Main Street, Visalia.

A GOLD-MILL SUPERINTENDENT

Of long experience, assayer and practical chemist, desires an engagement, particularly in a mill where gold and amalgam is wasted. The best of references given. Address E. W., 1278 Tenth Avenue, East Oakland.

WANTED. A MAN WITH SOME KNOWLedge of practical and analytical chemistry wishes employment in a laboratory, metallurgical works, fertilizer factory, mine, or something of that character. Address B. C. H., 2133 Elm Street, Oakland.

Assessment Notices.

LEIGH GRAVEL MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of November, 1890, an assessment, No. 2, of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, 320 Sansome Street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 24th day of January, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. E. FALL, Secretary,
Office, 320 Sansome Street, Room 57, San Francisco, California.

DELINQUENT SALE NOTICE.

GRAY EAGLE MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 20) levied on the 20th day of October, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Buffington, J M, Trustee	528	2,000	$120 00
Barrows, A W, Trustee	547	1,000	60 00

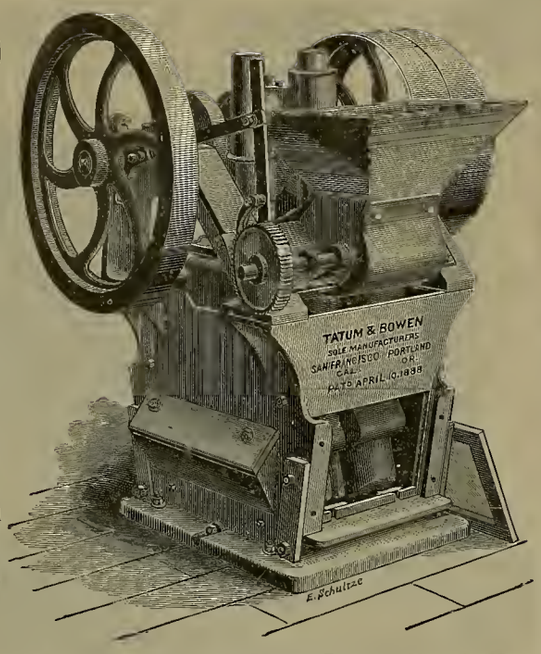
PERFECTED

DOUBLE

Economic

Quartz

Mill.



Attached to each Mill is an effective

Automatic Ore Feeder.

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly, [Signed] JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

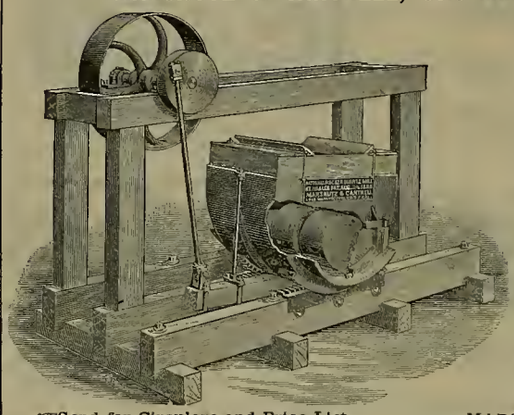
CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

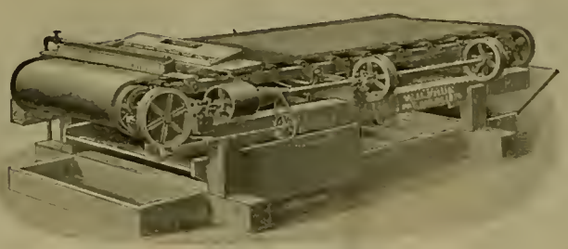
IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having donble the Capacity and doing its work as olose as the plain Belt machine, while its oonoentrations are olean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frnes are taking the Pnlp from 120 Stamps, crnshing 350 tons per day, and is giving entire eatisfaction as against 48 plain Belt Machines, taking the Pnlp from tho other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at offioe.



Protected hy Patents Decemher 22, 1874; Septemher 2, 1879; April 27, 1880; March 22, 1881; Fehrnary 20, 1883; Septemher 18, 1883; Jnly 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Trinmph" Ore Concentrators, the "Frne" Vanners and other forms of concentrating devioes, do not warrant the assertion that the "Frue' Vanner is the hest ore oonoentrator in the market. The fact that the "Frues" have improved (corrngated) helts does not militate against the snperiority of tho "Triumphs;" for, when desired, they (the "Trinmphs") can he mounted with a snperior helt known as the "Blasdel" Riffled.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical oper tion; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

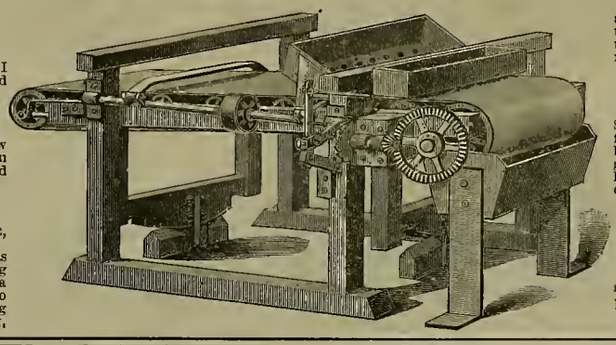
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented October 8, 1889, and December, 1890.

ANGELS, CALAVERAS COUNTY, NOV. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD, Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO, SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6th, 1890.
MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting, and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.



ANGELS, CALAVERAS CO., NOV. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours, T. M. LANE.
Supt. Madison Mine.

Price, $350, delivered at Factory, Angels, Calaveras Co., or at Milton railroad station free of charge. For further particulars, address

The Reports of Our State Mineralogist.

The Most of Them Scarce and All in Great Request.

It was stated in these columns not long since that we would undertake to obtain and forward to parties sending for them copies of our State Mineralogist's reports, we being then under the impression that these books could be procured from that official or elsewhere found without much trouble. This announcement having brought through the mails many applications for these reports, we find now that, with the exception of the last two issued, they are not to be had. This compels us to withdraw our promise, its fulfillment under the circumstances being impracticable. We will, however, keep it good so far as relates to the reports of 1888 and 1889, the most voluminous and important in the series.

The article on chlorination, prepared by Mr. Irelan, State Mineralogist, and which formed part of his report for the last half of the year of 1886, will be reproduced in the next issue of the PRESS. This is done because there is for that article a great demand, the book in which it originally appeared being now out of print and so scarce that it commands a very high price. That the price asked for it does not generally stand in the way of its purchase sufficiently illustrates the utility of these reports and the high estimate set upon them by the mining community. As helps to the entire guild—the metallurgist and the millman as well as the prospector and the practical miner, any one of this series of volumes is worth vastly more than the State has paid for the founding and support of the Mining Bureau, admittedly one of the most beneficent as well as the best conducted of all our public institutions.

MINING IN CHINA.—The Mo-ho gold mines in China now employ over 10,000 men, mostly natives of Shangtung. There are four mines. The Government takes four-tenths of the gold extracted, the remaining six-tenths going to the miner. Sometimes a man will get none out of a whole day's work; at other times several ounces will be obtained. The regulations are very strict, and any theft is severely punished. The machinery employed is not got from abroad, but made in a factory near the mines. It is thought that with European machinery the output would be much larger.

ALUMINUM bronze of ten per cent, it is claimed, has a breaking strength of 310,000 pounds, as against 80,000 pounds for steel; hence, when the time comes, which cannot be far distant, for building bridges of aluminum or its alloy, we shall have a structure about one-third the present weight and much stronger.

LAKE SUPERIOR IRON ORE to the amount of over 8,400,000 tons was mined this year in that region. This is said to be 1,000,000 tons more than the output of 1889. The Escanaba and Marquette mines produced 5,000,000 tons.

THE SURF AS A WEATHER INDICATOR.—The plan of the hydrographic office at Washington to study the action of the surf along the Atlantic Coast and use it as a basis of foretelling the weather at sea is proposed as a tentative attack on the mysteries of ocean meteorology. The work of the Signal Service Bureau in foretelling the weather ashore is dependent on observations from all over a continent of 3000 miles broad and stretching to even a greater distance in length; but on the sea there are no such aids to the observer. The experienced and fully competent men in charge of the hydrographic office would not have sanctioned this scheme unless they had good reasons to think there was something in it, and those who go down to the sea in ships will await the result of the experience with a very lively interest.

THE New York and New Jersey Bridge Commissioners have received a report from Mr. Thomas C. Clarke, the chief engineer. The report was not made public, especially as to location. Generally outlined, the plan proposes to bring all the railroads centering in New York into one great union station within the city. The bridge would have eight tracks, would cost "between $30,000,000 and $40,000,000," and the "bridge is to be centrally located." This is not the North River bridge, upon which Congress has taken action and which has engineers now at work on the surveys.

AN ELECTRIC FORGING MACHINE.—Electricity is about to be introduced into the iron-mills of Carnegie, Phipps & Co., in Pittsburg, Pa., in the manufacture of iron and steel. Two prominent officials of that firm recently received a patent for an electrical device, called an electric-forging machine, which is used for the purpose of "stoving" eyebolts for bridge structures. The machine up to the present time has only been used on an experimental basis, but as these experiments have been very successful, it will be generally introduced in the works very shortly. The inventors claim that by the use of this machine a greater amount of work can be performed, and there will also be a great economy in time and expense, as fuel will only be needed to furnish power for the dynamos.

SALT MINES AT WIELICZKA, AUSTRIA.

THE net earnings of 127 railways for the month of September, according to statistics collected by the *Financial Chronicle*, are $21,782,191, as compared with $20,843,425 for the corresponding month of last year, an increase of 4.5 per cent. Considering the roads by groups, it is found that only two of the groups show reduced net earnings, viz.: the Middle, Western and Northwestern. The Southern, Southwestern and and Pacific groups show increases of 4.35 per cent, 6.71 per cent and 2.9 per cent. This showing, while far inferior to that for the best months of the year, is a marked improvement over preceding months.

Salt.

One of the most indispensable necessities for humankind, and animals as well, is simple salt. It has been used by man as a condiment from the earliest periods of history. It is referred to in the "Odyssey," in which mention is also made of some parts of the interior of India and some remote islands where the article was unknown in the days of Homer. In those days salt was regarded as something sacred—as a gift of the gods. Even the land where it was found was counted as holy. The early nations and tribes of Europe often waged war for the possession of salt springs. In the days of early civilization, and even down to modern times, "bread and salt" went together in common phrase. In the early history of the Jews in the book of Numbers, mention is made of "a covenant of salt."

The first production of salt was from saline waters, and down to the present time that is the source of about one-half of the salt product of the world. It was not until mining was introduced that rock salt became a merchantable product. Mineral, or rock salt, as it is usually termed, occurs in almost every portion of the world. It is confined to no particular strata, as is the case with coal, but it is found in all geological ages and at all depths from the primary rocks to the latest sedimentary deposits. Much rock salt is obtained from deep deposits. In rainless countries it is often found upon and sometimes rising above the earth's surface. When it lies deep in the earth it is mined much like coal.

The accompanying illustration is from the interior of a mine at Wieliczka, in Austria. The underground operations, it will be observed, are precisely similar to those in use in coal mines. Two shafts may be noticed with the men descending and ascending. Galleries are cut out in the mass of salt; mules and tramways are there.

Rock salt is sometimes found sufficiently pure to be placed directly upon the table after being properly reduced by grinding. It is sometimes so much mixed with earthy matter that it has to be dissolved, drawn off and evaporated. New deposits of rock salt are continually being brought to light in various parts of the world, and particularly on this continent.

A HUGE BLAST.—No less than 22,000 pounds of powder were used in a successful blast recently at Port Crescent, on Puget Sound, in the State of Washington, for the purpose of displacing about 65,000 tons of rock, or 320,000 cubic yards of rock in a bluff that juts out at the western side of the harbor at that place. It was fired by electricity, and the result was entirely satisfactory.

THE Detroit Dry-Dock Company is to build at that city the largest dock on the lakes. It will be 400 feet long, 52 feet wide on the bottom, 94 feet wide at the water-line, and with 16 feet of water over the keel-blocks. The dock will be wood, with a caisson steel gate.

We admit, unindorsed, opinions of correspondents.—EDS.

Meadow Lake District.

New Methode for the Treatment of Its Ores.

EDITORS PRESS:—Since the discovery of this district nearly 30 years ago, persistent efforts have been made and methods innnmerable tried for accomplishing the successful reduction of its ores, bnt so far without satisfactory results. So little satisfactory, in fact, have these efforts proved that this district has been practically abandoned for many years, Meadow Lake having become the represantative of dead mining camps and the synonym of failure; hnt there have ever been those who believed in the valne of the ores and cherished a faith in the outcome of the district. That this faith has not been wholly groundless, coming events are likely to prove.

Though a great deal of money has been spent here in the endeavor to work these ores with profit, this has not been all in vain, there being little doubt hut this expenditure has acted as an incentive to still greater and more determined efforts, and that it will ultimately prove to have been the forerunner of success. "Give up" is not set down in the lexicon of the miner, and when one device fails, another is called into action, and so on till at last a seeming impossibility becomes a living fact. Such has been the history of Meadow Lake. At last, however, every assurance is given that the rich sulphuretic ores of this district can be treated successfully, and a plant is now being erected to accomplish this result. No one disputes that all attempts made to handle this ore by the chlorinization process have resulted in failnre, and a cognizance of this fact has led to carefnl experiments for the concentration of the rich hut rebellious atoms; and by thus reducing the great bulk of the ore, it can be handled at a profit. Frne concentrators will collect and precipitate every particle of metal contained in the rock, and these invalnable devices will he employed for that purpose. Even admitting that more than an ordinary percentage of loss does follow this treatment of the ores, it will not figure in the premises to any very great extent. A discrepancy of this nature can be well endured, owing to the remarkably high percentage of sulphurets contained in the rock.

One valuable lesson has been learned by those who have experimented on these ores—one that will contribute more to future successes here than all else combined. It is a well-known fact that there is a large amount of what is known as free gold contained in the rock—an amonnt that would pay handsomely nnder favorable circnmstances, and this is the *Ignis Fatuus* that has lured many mining men who have operated here on to ruin. They would persist in the fruitless endeavor to save this so-called free gold, and gave no thought, or at least hut little attention, to the rich though refractory ore that was being carried away. The trouble is that no ordinary process will save even the bright-looking gold that is caught in such seductive qnantities in the horn or pan. There seems to he a coating of some description on the gold that renders it foreign to the subtle influence of qnicksilver, and it cannot he reached hy it. The man who invests his money here in an endeavor to catch this luring wealth hy any free-milling process will lose it every time. It is something that cannot he done at present, and extremely doubtful if snch a thing will ever be accomplished. The proper, and in reality the only, way to handle these ores successfully is to pay no attention whatever to free milling, use no plates, depend upon nothing hnt concentrators and chlorinize the residue. The Frne machine, as stated before, can accomplish the much-desired end. Samples innnmerable taken from this district have hsen tested all over the world with the most flattering results, and the wonderful percentage of sulphurets contained has in every instance been indeed surprising. In this State, mining properties base in their nature, carrying only a very small amount of free gold, are being operated profitably, yet the percentage of hase metals under a most searching system of concentration only ranges from two to four per cent per ton gross. In comparison we will place the ore taken from the Hercules Mining Company's properties in Nevada county. These ores give a return of from 8 to 22 per cent of gold and silver bearing hase metals, the assay value of the same being about $60 per ton. There is now in this city at the metallurgical works of C. A. Luckhardt & Co., on Stevenson street, a ton of this ore that is open to inspection, and any one so inclined can test it to his satisfaction. It is not selected hy any means, hut is a fair, impartial sample of the character and grade of ore to he found in the Meadow Lake country. The property owned hy this company comprises two locations 600 feet in width by 1500 feet in length each, thereby giving them a strip of territory 3000 feet in length. The ledge is large and well defined, ranging in width from 8 to 50 feet, running about east and west, with a slight trend or dip to the south. The rock is highly mineralized in every portion of the ledge, and for cheap and rapid development it could not be more advantageously located. A never-failing stream of pure, clear, mountain water sufficient in volume to rnn a dozen mills and insnring a pressure of 300 feet, rnns directly over the location, and all machinery placed on the property will he moved hy this power. Timber for mining and hnilding purposes is abundant, and indeed every natural facility for the successful working of the property is immediately at hand. Meadow Lake district is situated in the most picturesqus portion of the Sierra Nevada, and is reached hy a fine mountain highway running from the town of Truckee, on the C. P. R. R. This is the route over which all supplies are transported, the grade being easy and the roadbed firm.

The Hercules Company will commence operations early in the spring, and will prosecute work vigorously nntil the property is fully equipped and in running order. This company will pay no heed whatever to a free treatment of the ore, hut proposes to concentrate exclusively and operate chlorination works. There are many valuable properties in this extensive mineral helt, prominent among the number being the Excelsior, Bodie, Mohawk, Grant, Johanna, Belcher and others, all of which have a promising futnre. The Excelsior has been operated under a bond, and it is stated that a strong syndicate will take hold of it and commence vigorous operations in the spring. In this event, it is proposed that concentration he exclnsively adopted and the most scientific methods employed to rednce the concentrates.

There will nnquestionably he a great amount of work done in this district next season, and if success follows, and it surely will with proper care, the Meadow Lake country will fairly hnm with prosperity. Those owning properties here will not relinquish them, hut are determined to keep np their assessment work, feeling confident that another year will bring about results that will he permanent in their nature and that the old and struggling camp will yet come to the front as a large gold producer.

The topography of the country is such that a railroad can he constructed connecting this mineral belt with the overland road, and though this idea may be ridiculed hy skeptics, it is nevertheless one of the probabilities of the near fnture. R. C. G.

Rich Placer Prospects in Idaho.

EDITORS PRESS:—In these later days of placer mining, 50 cents to the pan in the grass roots and $5 to the pan on bedrock, will to many sound big; yet such is the quality of dirt found in the pay streak of a claim recently opened six miles east of this place, on the north side of Kirtley creek.

The ground was discovered last spring hy the present owners, Messrs. Chompton & Dougherty, two old-time placer miners. While drifting in the side of the main creek, making about $2 per day, noticing a coarse color sticking in the black loam above their gravel streak, they tried a pan of the dirt and got such a flattering prospect that they quit their drift and sunk prospect-holes in the surface; which done they soon traced this gold to its source in the adjacent foothills.

Proceeding to work this newly discovered deposit in a regular way, it has since yielded at the rate of about $1.50 per sack on the bedrock, enabling these men to make large daily wages since. The gold obtained is of good quality, being worth about $19 per ounce. While its well-worn appearance indicates that it had traveled a long way from its original source, the fact of it occurring in the surface soil shows that it did not travel far the last move it made.

Should this deposit prove to be extensive, a considerable immigration to this locality may be looked for in the spring.

Copper Prospects.

About four miles north of this place in the main Rockies, is situated the Shylock group of lode claims, located last July. The ore here, consisting of copper and gold, runs high in both metals, the lode ranging from 20 to 200 feet in width, and cropping boldly for 3150 feet, the whole length of the claim.

The widest stratum which lies next to the hanging-wall, is from 5 to 15 feet wide. It is a brittle, black quartz, containing spots and stringers of black oxide, with occasional kidneys of copper glance and seams of pure cuprite, the latter carrying 74 per cent metallic copper with a little gold and silver.

But little exploratory work has as yet been done on this deposit—an incline shaft put down 15 feet on the hanging-wall, comprising about all that has yet been accomplished. Good facilities exist in the vicinity for opening the mine and reducing the ore, timber being abundant with enough water running in the gulch near hy to furnish a 500-horse power.

In the Birch Creek district are other copper-bearing veins, some of which have been located and partially opened hy residents of Salmon City, and all of which make a fair showing of values. What promise to be valuable deposits of a good lignite with some streaks of a bituminous coal have also been discovered near this place. These deposits are now being thoroughly prospected. Should the result prove satisfactory, it is expected that a branch railroad will ultimately he extended into this region of country. R. B.

Salmon City, Idaho, Dec. 10, '90.

THERE are not enough engineers in the navy to man the new ships.

MONTANA men demand eight hours without a reduction of wages.

The Gold Belt of California.

NUMBER V.

The Ancient Placers and Their Relation to Wall Rocks.

[Written for the MINING AND SCIENTIFIC PRESS by STEPHEN BARTON, Kernville, Cal.]

In order to reach a just conclusion as to the remaining wealth of the ancient river beds and their source of supply of the precious metals, it is necessary to know the conditions under which the deposit was made. Prof. Hanks looks to glacial action. In a previous series I have pointed to evidences of climatic conditions such as do not accompany the movement of glaciers. But when we contemplate the excessive supply of water and the long distance which the gravel in some of these channels had evidently traveled, the question arises, may not glaciers farther to the north have contributed much of the water?

Before deciding such a question, the geologist must master all the other sciences. He must look to astronomy for causes of climatic change; to statics and dynamics for means of estimating the volume of flow; to botany and paleontology for estimating the age and nature of the deposit.

It is quite unnecessary to explain to the student of nature that there was a time when an ice continent capped the pole, covered the highest mountains of New England, sent a glacial drift into Northern New Jersey, and spread a broad terminal moraine over the prairies of Central Iowa. Nor is it necessary to explain that this ice afterward melted away. Let the reader recall, then, that it would take the present Mississippi a number of years to fill a cube of ten miles, and that this ice capping must have represented a depth of ten miles on the shores of Hudson's bay. It is very evident to the geologist that during the melting of that ice a stream as large as the present Mississippi flowed from Lake Michigan through the channel of the present Illinois river, that a similar stream came down the Wabash, and that Lake Ontario outlsted through Lakes Champlain and George into the Hudson at Troy. While this was going on, probably an amount of water equal to the whole drainage of the American continent of to-day was passing through the State of Nevada to the Gulf of California. What is called the Japan current then, probably, struck the coast lower down and gave to this country, under other conditions, a climate similar to what it now has.

Scientific men have not done, however, with inquiring the cause of this changed condition of climate, and before returning to the main subject of inquiry, I will make a few observations in relation thereto. Whoever has been so fortunate as to he able to visit the modern schoolroom, has seen suspended on one of the walls a chart or diagram of the continental and oceanic hemispheres. The one striking fact, at once observed, is that these hemispheres stand diagonal to the poles. Let us now enter the school yard. We find the boy spitting on one side of his top and weighting the wetted side with sand, doubtless for the very purpose of noting the staggering movement this diagonal weighting of polar regions will produce. While spinning very fast, the top staggers hut slightly and very slowly; hut as diurnal rotation diminishes, the staggering increases in extent and rapidity. A change in the amount of diagonal weighting increases or diminishes the precessional movement. Now it is conceded that the whole Mississippi valley was filled to an unknown depth hy sediment brought down from a lofty mountain range which once stood on the shores of Hudson's bay. When this mountain was then in all its pristine grandeur, it intensified the diagonal weighting of the northern pole. The attraction of the sun and moon upon the higher regions of the equator were not sufficient to overcome this vibrating tendency, and the earth's poles were inclined 55 degrees from the perpendicular to the plane of the ecliptic. During a portion of the year the rays of the sun fell quite as directly upon the pole as upon the equator; besides, at the pole, it did not set for six months. This gave to each of the polar regions such a vegetable growth as is hardly met with now under the equator, and was the parent of the vast coal-fields of high latitudes. As this diagonal weighting wore away, by the bending forces everywhere at work, the poles of the earth started to right themselves to a position more nearly at right angles with the plane of the ecliptic, hut a movement once begun did not stop at the point of a true mean, but like the pendulum continued as far the other way, and came to within say 5 degrees of the perpendicular. The equinoctial and the ecliptic now nearly coincided, and the sun moved hut 5 degrees from the equator. Polar regions were enveloped in ice. While ice was shoving great blocks of granite upon the prairies of Iowa, the valley of the Parana was invaded at the south and glacial silt was finding its way even to the valley of the Amazon. Ocean currents were more pronounced than now, and did much to maintain the dominion of the sea. But on the land this diagonal weighting was again taking place, ice being substituted for granite. Like the return of the pendulum, the poles of the earth were only ready to return again in the direction of the point of mean inclination when it felt the additional impulse of this extravagant weight of ice. As the sun rose to a higher elevation in the polar regions, every summer, the ice of ten thousand winters began to disappear, and one half of the contents of the ocean no longer remained locked in a solid form. To assume that these vibrations have not been repeated—repeated as often as the swinging of the pendulum—is to assume that the earth had a beginning, and no scientist is ready to declare, as a known and scientific truth, that it ever did grow any faster than as we see it growing to-day, hy the falling of meteoric matter from the regions of space. There probably have been times in which one of these ice continents outgrew the other, in consequence of these two facts: First, the earth's orbit is elliptical and in its yearly circuit it is three days longer in making 180° on the long than on the shorter side; second, this extra amount of sunshine is given first to one pole and then to the other, every 26,000 years, in consequence of the swinging of the poles, which swinging gives the precessional movement of the points when the equinoctial crosses the plane of the ecliptic. Hence for a period of 12,000 years there are three days more of sunshine per annum upon one pole than on the other, and then the extra sunshine passes the equator in the direction of the other pole. The building of an ice continent on one pole in excess of that on the other would change the center of gravity of the whole earth to the extent of balancing the matter thus transported, and this increase of the solids would draw the fluid ocean after it and raise coast lines in that hemisphere.

Thus we see that the ancient channels may have met the sea in the region of the placer mines. If this was the true condition, then the coast line must have been elevated farther north and the ancient channels must have had a lower grade than that now indicated. This was undoubtedly the case. The great caverns in the line at Columbia which were filled to a depth of 50 feet or more in some instances, were undoubtedly filled hy the sobbing and circling of the cross currents of a mighty stream running over a rough formation at a low grade. Every placer miner knows that when a current plunges into a pot-hole it will leave no gold there; hnt here the gravel had been deposited hy a circling current against all the walls of the "sink," as these deposits were called, the sheet of gravel standing nearly vertical against all the walls.

It remains to he noticed the chemical effect which ice and rain-water have npon formations containing lime, whereby every fissure is eaten into a cavern in addition to the eroding power of a powerful current. Such forces, in many cases, tore down the incasing walls of the lode and subjected the matrix to decomposition. In the older granites, the bottoms of the lodes were reached, and the evidence of their location obliterated. In other cases, the entangled current, struggling with a broken bed, had its transporting power reduced, and deposited gold and gravel near the native matrix. Thus I conclude that the large lumps found near Columbia were born of that region.

I did not start in to write a geology of California, nor did I, like some of our most eminent geologists, aim merely at the harmonizing of theological creeds. I have aimed to present an honest and impartial view of the facts presented to me during years of mining life and the conclusions which I deem justly deducible therefrom. I am aware that the conclusions I have arrived at are at war with those of many eminent writers, hnt must plead in extenuation that none of them claim to he able to explain all the observed facts. If some one of the old mines in Mexico, of which the Padres have handed down a record, should he reopened to great depth and he found to he fabulously rich, as reported, in the bottom, after hundreds of disappointing results in similar searches, I should probably do like other writers on geology—eliminate what I have said about mines and try a new theory. I have aimed to keep in harmony with all known laws, while I have refused to take the dictum of a great name against the evidence of my senses. And now I believe I will close, perhaps forever, my discussion of the geology of the placer mines.

The Pan-American Railroad.

The Intercontinental Railway Commission, composed of representatives of the United States and other American republics, has been called to order in Washington by Secretary Blaine. The Commission is called to promote the survey for a line to connect the railway systems of North America with those of South America. At present the American and Mexican systems extend 183 miles south of the City of Mexico. To carry them to the northern boundary of South America will require about 1700 miles of line through Central America, of which about 300 miles are already constructed and in operation, and about 800 miles are being surveyed and constructed, leaving 600 miles yet to be located.

In the southern part of South America the Argentine, Chilean, Brazilian and Uruguayan railways are in connection and extend northward within 120 miles of the Bolivian frontier and are being rapidly pushed farther. Concessions have been granted for a line to connect them with the Bolivian and Peruvian systems, which will afford connection with Cuzco, Peru. Between that point and the northern boundary of South America little has been done, although lines are now projected from Cartagena to Bogota in Columbia. From Cuzco to railway connection in Costa Rica is about 2200 miles. Here is where the bulk of the work is to be

done and the ronte is yet to be decided. This is one of the problems that will come before the convention. The Pan-American Conference favored uniting the chief cities along the route as far as possible, hnt where that would be inconvenient to connect them with the trunk line by branches. The line on the western flank of the Andes taps the richest agricultural country, hut there is a choice between that and lines along either the Andean plateau or the western slope. The greatest difficulties along the line are believed to be in crossing the mountains in Colombia.

The Sources of Nickel Supply.

Since the discovery of the value of nickel-steel plates, large calculations of profit are indulged in by owners of nickel properties and others interested in smelting works. The future demands for armor plating are put down at large figures, and if accounts are entitled to credence, there is something like a scramble by manufacturers in the United States and Europe to secure themselves from the greed of mine monopolists. The sources of supply, therefore, are inquired into with unwonted interest. Hitherto the demand for nickel has been on a comparatively limited scale. So it happened some years ago, when mines were opened in Noumea and two full cargoes were shipped for consumption, that the market at once became overstocked, prices dropped to a nominal figure, bankruptcy became imminent, and the mines which had been exploited with so much enthusiasm were incontinently closed. The situation at present is radically changed, for in addition to the wide demand for nickel in the arts, chiefly on account of its anti-corrosive qualities, the metal is discovered to possess a peculiar ductility, which admits of its use as an alloy with special advantages. For example, a new French rifle cartridge has been brought out in which nickel forms an essential part; but it was not until the superiority of nickel steel for certain purposes was announced that the nickel-boomers got fairly to work.

The nickel mines in New Caledonia were the richest known up to a recent date, and were the principal dependence. Considerable quantities of nickel have come from mines in Norway, owned and worked by Sir Hussey Vivian, Bart., M. P. The United States Mint derived its supply from mines in Lancaster county, Pa., owned by Joseph Wharton. The discovery of nickel at Sudbury, in Canada, is of recent date, so that the development as yet is very imperfect; but indications point to the existence of the ore in large quantities. These mines are said to be owned jointly by a Cleveland syndicate, the Canadian Copper Co. and Sir Hussey Vivian, the latter represented by Emerson Foote of New York. The matte from Sudbury carries 30 per cent of copper and 15 per cent of nickel, and in this form is sent largely to Swansea, where the pure nickel is extracted.

We are informed that quite an extraordinary discovery of nickel has been made quite recently in Nevada. Among those best informed it is spoken of as "a wonderful development," and this representation is supported by the exhibit in this city of masses of ore. It is claimed that the nickel is found in deposits almost limitless and of such richness that even what is termed the lowest grade yields 8 to 12 per cent of pure metal. Quantities aggregating hundreds of tons are in sight, which give by analysis from 20 to 35.4 per cent of ingot metal.

The consumption of pure nickel in the United States has been estimated at 800,000 pounds per annum, but in this country and elsewhere there will be increased demands, partly as a result of the recent discovery of malleable nickel used as a veneer for iron, which is made a more acceptable material for household utensils. Private London advices received in New York, and said to be wholly authentic, are to the effect that the British Government has recently been unable to place nickel-steel orders because the nickel could not be obtained. This small supply is attributed mainly to reduced receipts from New Caledonia. The present price in New York is 80 cents per pound for delivery during the ensuing year. From the foregoing it would appear that the Sudbury mines form the main reliance, although it is by no means certain if entire dependence can be placed on the latest advices, that Nevada will not in due time be ranked equal, or even of more importance. Developments at these two points will be watched with unusual expectancy, especially if it is true that the New Caledonia mines are less productive than formerly.

THE wonderful extension of the railway system of this country and the great number of large streams, has led up to an enormous amount of bridge-building. Among present projects is the North River bridge, with a span of 3000 feet; Hudson Bridge, below Albany, 1600-feet span; New Orleans bridge, three spans of 866 feet; Philadelphia bridge, over the Delaware river, with a span of 4440 feet; this is a suspension scheme and seems incredible; Louisville and Jeffersonville bridge, over the Ohio river, total length, 8505 feet; Ohio river, at Bruno's island, near Pittsburg, span 523 feet; Needles bridge, Colorado river, span 660 feet; Memphis, Tenn., bridge over the Mississippi at that city, and at least a dozen more. Nearly all these bridges are for railway purposes.

THE English labor world is still in a state of disquiet.

Death Valley.

A Government Expedition to Visit it Shortly.

"Valley of Death."

Long before a white man ever looked upon the dreadful spot, the Indians of California and Nevada knew it by that name.

Imagine a narrow strip of arid plain, shut in between two mighty mountain walls, the peaks stretching up 10,000 feet into the burning sky. So precipitous are these rocky barriers that in a journey of 14 miles you pass from an eminence of two miles above sea level to the plain 175 feet below the ocean tide mark. The surface of this plain is composed of salt and alkali and it is impossible to go over it on horseback, because it is a mere crust through which the animal you ride breaks up to its knees into a thick alkali paste which eats both hair and hide. There are paths by which one may make one's way across if one knows where to find water on the opposite side.

There is something unearthly about the whole appearance of things in the valley, the two ranges of gigantic peaks that hem it in between them looking like the backbones of a couple of monstrous beasts, and a gray haze that never lifts, making everything indistinct to the view. No vegetation is to be seen save a very scanty sagebrush, with leaves that are not green but gray, with here and there a tall cactus, which looks in the night like a dead man standing erect with arms extended. But the supreme horror of the place is the heat, which is unspeakable. There is a breeze which, instead of being cool, is so scorching hot as to blister your face. Into this natural furnace the sun pours its rays with never a cloud interrupting from one year's end to another. When the famous geologist, Professor Gilbert, succeeded in crossing the valley, nearly 20 years ago, barely escaping death from thirst, the thermometer inside his saddle-bag went up to 130 degrees and then burst.

A suggestive feature of the Death valley landscape is the color of the mountain rocks, which are actually sunburnt to an iron brown hue. Chip off a little flake and you find the stone of its natural lighter hue underneath. Streams flow from mountain springs down toward the valley, but never reach it because the heat dries them up on the way. Once in a great while there is a tremendous storm in the Amargosa desert to the eastward, and a river a mile in width flows from the desert around the south end of the Amargosa range and northward through the valley. Does it flow out again at the other end? Not much. It is dried up and lost before it gets that far.

Such is the Valley of Death—itself simply the most horrible spot in that great region of despair. The object of the Government in exploring it is simply to learn what kinds of animale live there. This enterprise is part of a great work which the Department of Agriculture has been for some time carrying on, the purpose of which is to map out the whole United States into what are called "faunal areas." For example, suppose it is determined what are precisely the limits of the area occupied by the jackass rabbit. When that much is known, it must necessarily be true that any plant which thrives in one part of that area will do well in any other part. There is such an intimate relation between animal life and plant life in this world that, having found out the various areas inhabited by different birds and mammals, you have learned just where each form of vegetable growth can be produced to advantage. When the Government has completed this important task, the farmers of the country will have placed before them maps outlining with the closest accuracy the regions within which each kind of vegetable or fruit is susceptible of profitable cultivation. Thus the agriculturist, wherever he may be located, will know with certainty what he ought to plant.

At the beginning, the expedition will be divided into two parties. One of these is now at Owens lake in California, on the point of starting out. It is under the command of Vernon Bayley, and will begin work at the foot of the Inyo range, to the west of which Owens lake is. Bayley will not go far, however, until joined by Professor T. S. Palmer with the other party.

The first thing done will be to locate all the places where water is to be found. Hundreds of people have lost their lives in Death valley through starting off in the morning without knowing where they were going to find water at night. There will be no such foolishness as that indulged in by the expedition. With every precaution, a sufficient amount of suffering will of necessity have to be undergone. Water is the great desideratum in that horrible place, where the air is much drier than that of the Sahara, and the heat so great as to put the body through a sort of evaporating process such as that to which a dried apple is artificially subjected. So rapid is this evaporation of the bodily moisture that three gallons of water a day are absolutely necessary for each individual, instead of the three pints one ordinarily consumes. If one were to sit down in the desert all day long and do nothing but drink water, he would still feel thirsty. Even with a supply of three gallons a day the blood of the traveler across the waste becomes thickened, the features grow thin and peaked, dreadful constipation sets in and fever threatens madness. In crossing the valley one cannot very well carry with him more than enough water for one day's supply. The only way to do is to hurry over and try to reach the other side—only about 15 miles distant—before one succumbs for want of drink. If you know precisely in which of the gorges of the mountains springs are to be found, it is well enough, but if you are not certain on this point, you are likely to become so exhausted after travelling up to the heads of one or two gorges fruitlessly as to find nothing better to do than to lie down and die the most horrible of deaths. You will not need burial, for your body will not decay, but will simply be shriveled up to a mummy and lie there in the Valley of Death to all eternity, imperishable, staring up at the burning sky. Here and there all over the awful plain of salt and alkali are scattered the dried bodies of men and animals, preserved for all ages to come. During the mining fever in that neighborhood, from 1872 to 1878, hundreds of people were lost in trying to get across. You may have heard of an "alkali sink." That is what Death Valley is. As has been said, the plain of the valley is below the level of the sea, and the alkaline river flowing into it at certain seasons from the Amargosa desert deposits its alkali in the crust, through which the foot in stepping breaks into the abominable paste beneath.

It will be the work of the expedition to kill and capture every sort of living creature that can be found in Death Valley and its surrounding region. Every specimen of animal life to be discovered there will be represented by from a dozen to a score of specimens in the collection which will be brought back to Washington. Mammals, birds, reptiles and batrachians will all be grist to the mill of the naturalists. It is expected that many new species will be secured, such as are not at present known to science. The birds will be shot and the mammals will be trapped at night. All of the gentlemen engaged in this exploration are most expert trappers and they will carry with them many dozens of small steel-wire contrivances of a sort that are found most effective in the capture of all kinds of little quadrupeds. It is not anticipated that the valley itself will afford many examples of animal life, save for reptiles and insects, but in the mountains and around about the oase will be different. As for the reptiles, they will be caught with the hand or by throwing something over them. Doubtless a valuable assortment will be secured of lizards of different colors, and of the peculiar rattlesnakes with horns over their eyes which belong in that country. There are no frogs there, it is supposed, but there are some queer desert toads that live in "washes" where there is water for part of each year. When the water dries up, the creatures bore their way down into the mud deeper and deeper, and when it hardens over them like so much brick, they simply stay there buried until the water comes a few months later to release them from their baked prisons. The entomologist of the expedition will devote his attention to gathering the desert beetles, ants, scorpions, centipedes, and the like.

Very particular attention will be paid to the birds, which, as soon as shot, will be carefully measured in the flesh, skinned and stuffed on the spot. After being stuffed, they will be packed in chests of drawers, which are very hard to carry on muleback, until they are dry. Then they will be put into small boxes with cotton wool and sent to Washington whenever a chance offers. Necessarily communication will have to be constantly kept up with civilization, inasmuch as enough provisions cannot be carried along at a load in the wagons to last for the entire season. The town called Keeler, at Owens lake, will be the intermediate point utilized between the expedition and the world. All the mammals captured will be treated just like the birds. The reptiles will be put at once into alcohol. Greatest interest will be felt in discovering what forms of life are able to exist in so mad a country. Such vegetable life as is found there will afford the botanist material for his collection. Incidentally, the mountains will be explored and covered by the operations of the parties.

The first white man who ever visited Death valley was Capt. Bendire, who told your correspondent yesterday that on the occasion referred to, in 1869, he did not attempt to cross the valley, but simply skirted around its edge, as he expressed it, "like a cat on the edge of a plate of hot mush." Captain Bendire, while doing the act of the cat on the plate of hot mush, came across only three dried mummies of men in Death valley.

Investigation will be made by the expedition of the strange fishes that inhabit certain springs at the south end of Death valley. These are deep pools, and in them are found fish unknown elsewhere in the world, which have no eyes. The whole country thereabout is certainly a most extraordinary one. Seventy miles south of the valley is so-called "Devils' Playground"—a dreadful desert, across which a wind like a furnace-blast continually blows, the black lava and hot sand of its great plain radiating back the sun's heat so that the whole landscape is tremulous to the eye. Southeast of Death valley 100 miles, is "Dead mountain," on the side of which thermometers have registered 140 degrees in the shade. On the east side, the precipitous rocks are much broken up and the sun shining on their white points and angles makes the mountain look from a distance as if whole conventions of ghosts were assembled upon it. The Indians believe, on this account, that the mountain is the abode of their dead warriors. Hence the name.—*Examiner.*

Shop Suggestions by a Cotemporary.

The Boston *Journal of Commerce* gives, among many others, the following reliable shop suggestions:

A bending action in shafts is always a sign of weakness, yet if there is to be any bending allowed it is better to have it distributed about than to concentrate it all at one place. Take a shaft, for instance, that is an inch in diameter, and compare it to one that is twice as large, but having a spot turned off in the center sufficient to leave it no larger than the first shaft in its weakest place; in theory there should be no difference between them.

In building inside cranks all the spring will come in the crank-pin unless the arms have been proportioned to take a share; and in overhang cranks it has been known to have put a stop to the crank-pins breaking by easing them off a trifle in the center, where they are to fit in the crank-arm, so that they will get all the grasping strain in each side, where it belongs, and allow them a chance to give, before a fracture occurs in the only place that it would otherwise have a chance to.

Some one has been making sport in relating his experience with an upright shaft of a turbine water-wheel. One of the boxes showed signs of wearing out for the want of rehabbiting. A temporary one was rigged up out of hardwood just for the occasion, when smoke soon began to make its appearance and all hands were kept busy carrying water from the mill-pond to keep the wheel-house from taking fire. Although wooden bearings are poor things, yet we think that we can show one made from the same kind of wood which has taken the place of babbit for nearly ten years.

A shop hand who has every tool that he can get hold of lying about where they were used last, requires about one-third of his time looking for them when wanted for use, and frequently is obliged to fix up something to take the place of a lost tool to help him out on a job. Where one hand in a shop is bothered in this way there must be something the matter with them all, and no shop can run long with such an extravagant pay-roll. Who could they have here for a boss?

It is one of the best points in a foreman to be able to find out what every shop hand is good for and work him in where he will be to the best advantage, and not let a tool-maker do all the polishing, or a natural-born painter fit up tools for a living. The times are getting around now where everything tells in a machine shop.

Steam should not be required to travel faster than 200 feet per second in entering a cylinder. To find the area in square inches of steam port, multiply the area of cylinder in inches by the speed of piston in feet per minute, and divide product by 12,000.

An overseer having a repair hand under his care who was inclined to be a little forgetful once in awhile, especially whenever any of the shop tools were being inquired for, decided at last to supply his friend with a note-book, to jot down everything that was taken out of the room and what they were last used for. Now, instead of hunting for a lathe dog for half a day, the note-book is first examined to see if it is on an old valve stem out in the boiler-room or laid up overhead on a beam somewhere.

There is a lot of work done at a disadvantage on the upper step of a step-ladder that should be performed from the floor where it belongs. Boring holes in the ceiling and screwing in eye-bolts and screw-eyes is dangerous work, especially where one has to reach out as far as he can to one side, from a light over a machine that is in motion. It takes but little fixing up to rig an extension rod to bore all such holes from the floor, and to catch screw-eyes in a clamp that will let go when needed.

Just as we are feeling pleased with electric lights, telephones and electric buttons, we find that a wire is to be led to the engine lathe to assist in turning tapers and irregular outline work that must be turned from a pattern. Two friction-wheels are attached to the cross feed that revolve continually in opposite directions and are thrown into gear by electro-magnets. A pointer reaches from the tool post to the gauge line that is given to work from, the electro-magnets taking great care to keep the lathe tool in a position where the pointer just reaches the gauge line, regardless how irregular it may be.

Another lathe man has a battery of his own make set up behind his lathe, which he claims assists his eyesight wonderfully. When he wishes to see if he has clamped his work on true, he sets a tool in the lathe that has a wire attached, and a bell rings the instant it touches the highest point of revolution. Sometimes a wheel is wanted to be set true with the bore. Then a tool similar to a boring bar is used, only it is made of brass where it comes in contact with the wheel, so as not to mar the surface, and at the same time to give the current a good chance to step across to indicate that a contact is made.

THE TIRED SENSATION of the optic nerve experienced by those using the electric light is said to be due to the fact that the luminous waves are of great intensity, and not to a preponderance of violet chemical rays.

THE World's Fair Committee at Chicago has stopped fighting, and now there is a chance for some work.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CON.—*Ledger*, Dec. 13: Supt. Jones reports no change in No. 2 main tunnel. The vein in the tunnel running south from crosscut No. 2 is about the same thickness, 10 or 12 inches. The rock is very rich. One can see gold in almost every piece. A telegram sent on the 10th ult. says the vein is two feet thick and looks well. For the week ending Nov. 22 the drift in crosscut advanced 20 feet. The vein has narrowed down again and is now only 10 inches wide. The ore is high grade but not quite as rich as it was. If we do not find better prospects in running south in the next 10 days, I shall advise making an upraise on the vein. We might find it larger above us.

NEW MILL.—The 10-stamp mill which is being erected by V. P. Yelmini in Pioneer district, near Mace's mill, is about completed. A pile of about 300 tons of rock from the Greisback claim is waiting to be crushed at this mill.

SUTTER CREEK.—The mining interests in this section continue to look up. The prospects in the North Star are as flattering as ever, and, if anything, give better promise of permanency. Stockholders are already feeling confident that the assessment money put in the ground has not been spent for naught. Stock has been sold for 50 cents per share in the past few days. The total assessments aggregate 45 cents per share. At the Rose mine a large body of ore has been struck, but only a small portion is of a paying character. The pay rock is in the form of numerous small stringers and the hope is indulged that these will eventually all come together and form a fair-sized body of pay rock. The new mill at the Wildman is running in good shape, and everything about the premises is prosperous.

Calaveras.

MEXICAN.—*Chronicle*, Dec. 13: The Mexican shaft, adjoining the Utica, is again opened up under the superintendency of Thomas Lane. Rock has been found in the mine that went as high as $1200 to the ton.

BENSON.—The mill of the Benson mine on Central Hill is running on good gravel and a new force of men will be put to work.

ANGELS ITEMS.—The Angels mine has closed down and the company intend, so it is reported, to build a 40-stamp mill before starting up in the spring. The Gold Cliff mine is running night and day and the 20-stamp mill is kept humming steadily. A better quality of rock is now being taken out than has ever been seen in the mine before. The sulphuret is prospecting well.

THE TOWN OF COPPEROPOLIS is gradually forging ahead and is destined to be one of the leading towns of the county at no distant day. Work on the ninth level in the copper mine has just commenced, which has given employment to a number of new hands. Several new families have taken up their residence in the town. New houses are being built rapidly. A new livery stable, hotel, and a number of other business houses have been erected lately.

El Dorado.

DEVELOP THE MINES.—Georgetown *Gazette*, Dec. 11: If our people will only wake up and catch on and interest themselves in encouraging mining enterprises, it is within their power to bring about a substantial revival in our mining industry, which will add thousands to the money now in circulation in this community where there are now only hundreds. We have slumbering mines of wealth only awaiting the spirit of encouragement to have them equipped and made producers. Besides these mines of quartz and ancient gravel beds, we have numerous flattering prospects of both quartz and gravel, well worth the judicious expenditure of capital and energy. In quartz alone, observe what a great benefit the operating of the Taylor mine has been to the community! See what an improvement is being felt even from the recent and small beginning of starting up the Van mine! If the mill-test soon to be made proves satisfactory, at least 50 men will be employed on the Van mine next spring. There are other propositions equally inviting in this mining district which ought to be taken hold of by practical California mining operators. The returns from our pocket, seam and placer mines are good so far as they go, but their output barely enables the town to hold its own. What the town wants is more public-spirited citizens who will take an active interest in aiding and encouraging various mining propositions; but the magnetic hand of enterprise in this place is apparently paralyzed. The community at large partakes of the Silurian nature of the average business man.

GRAVEL CLAIM.—A new gravel mine has been discovered and a company organized, under the name of Rocky Gorge Mining Co., west of the Josephine mine at Volcanoville. L. Evans is superintendent and general manager, J. Sheen secretary, and Courtney Fouch acting manager. Supt. Evans departed for San Francisco, Tuesday, to secure material for equipping the mine. The gravel is a dark-colored material, and prospects pay in every pan. They have located 6000 feet along the hill.

ABOUT PLACERVILLE.—The new machinery for the Pacific has nearly all arrived and been put in place, now being in working order. The new air-compressor of 80-horse power was expected this week. When that is in place, the mine will be in complete trim for heavy work, which will be pushed vigorously. A large amount of mining material has during the past week been hauled to the Toll House mine, Smith's Flat, where work is being pushed rapidly.

Inyo.

FROM THE MINES.—*Independent*, Dec. 12: The reports that come in from the various mining camps throughout the county are of a generally encouraging kind. Mr. Brooks, chief of the party which has made a survey for a big canal from Owens river to Salt Wells valley, went to San Francisco last week. It is understood that it will not be anything near so difficult to make as was expected, and it will not cost to exceed one-half of the first estimate.

Modoc.

COAL DISCOVERY.—Adin *Argus*, Dec. 11: John Thomas came over from Cedarville Tuesday last, and reports the discovery of coal in Steamboat canyon, five miles below Cedarville. Messrs. Neasham & Phillips are sinking a shaft, and report the prospect growing better all the time. We hope the ledge will prove to be genuine and the supply abundant. It would be worth thousands of dollars to Modoc county and another incentive to railroad building.

Placer.

MAYFLOWER CLEANUP.—*Republican*, Dec. 9: The Mayflower drift mine of Placer county cleaned up $16,000 last month and $9500 during the first six days of this month.

San Diego.

THE MANUFACTURE OF IRON.—*Union*, Dec. 4: Several months ago we announced that a project was on foot, backed by perfectly responsible parties, to establish blast furnaces either at Coronado or some convenient point on this side of the bay, for the manufacture of pig iron from the ore of the Tepustete mine below Ensenada, Lower California. The enterprise is so gigantic that it has been received with some incredulity. It should be borne in mind that a business of this character necessarily involves vast sums of money and a multitude of details, and that time is essential to perfect all plans before even a beginning can be made. Those who are financially interested in this matter have been diligent and their plans are now fast maturing. Quantities of ore have been taken from the mine and subjected to analysis in various Eastern cities. Eastern experts have pronounced the iron of an extraordinarily fine quality. Iron manufacturers have without exception expressed the keenest appreciation of the superior value of this ore. During the past week a ton of it arrived here, and some of the chunks were placed on exhibition at the California Bank and the cable company's office, specimens being also forwarded to Cleveland and Pittsburg. "You can state," said L. B. Howard and Gen. Webb to a representative of the *Union*, "that our plans are almost matured, and that the blast furnaces which the people have been hoping would be built, will be in operation within six months, positively. This great industry will under no circumstances be allowed to leave San Diego. Within six months we will have a plant with a capacity of 100 tons of pig iron per day. There is positively no doubt about it. As to whether it will be located at Coronado or on this side, we are not yet certain. Soon after the furnace is in operation a rolling-mill and other manufactories will follow. The plant will involve an expenditure of at least $500,000 and many hundreds of men will be employed. There has really never been any doubt about San Diego getting this, but you must bear in mind that it takes lots of time to arrange for so large an undertaking. The ore exists in inexhaustible quantities, very near the coast, and can be mined with great facility."

Shasta.

COAL DEPOSITS.—*Free Press*, Dec. 13: Upward of a month ago a special expert from the coal mines of Pennsylvania arrived at the Palace Hotel and proceeded into the interior of the State in search of coal deposits. He came to the coast in the interest of a syndicate of Pittsburg capitalists. Yesterday news was received here that the expert had made some remarkable discoveries in Shasta county: A few miles from Millville he found a rich deposit of coal equal to the best product of the Pennsylvania mines. Specimens of the coal will be shipped to Pittsburg at once and in all probability capital will be brought here from Pennsylvania to develop the mines.

JUSTICE PREVAILS AT LAST.—*Democrat*, Dec. 10: It appears that Mark Zellerbach has at last won the suit with Allenberg and others that has been in the courts for many years, over the possession of the Altonna quicksilver mine in Trinity county. Zellerbach will as soon as possible next year build two retorts on the mine and go to work producing quicksilver. This is a great and valuable property and resumption of work on it will give a decided impetus to business in Northern Trinity. The result of this suit gives general satisfaction, both because it is considered just and because it will benefit not only the neighborhood where the mine is located, but also the consumers of quicksilver, a metal that is not being produced in anything like the ratio that our gold and silver mines are being developed. As the Altoona carries a very high grade of ore and all the other conditions are favorable, a large and profitable production of quicksilver could be made here with a moderate expenditure. It is a pity this splendid property should have lain idle so long.

Sierra.

TROUBLE WITH THE CABLE.—*Tribune*, Dec. 10: A representative of the New Jersey company which recently put in the wire cable at the Mountain mine to transport ore from the mine up on the mountainside down to the mill near Sierra City, the contract price for which job was $27,000, has arrived at the mine and will endeavor to reconstruct the plant, the failure of which to work, by reason of the parting of the connections in the line, recently put a summary stop to the mine's operations. The distance between the mill and the mine is 6000 feet and there is one tower built midway to relieve the strain on the cable as the buckets loaded with ore are sent down. The gentleman from New Jersey now believes, after viewing the situation, that two more towers, so as to have one every 1500 feet, will be necessary, although on level ground but one is found necessary in a distance of 6000 feet. The change will at once be made. The milling machinery is reported to be working all right and the mine looks well. The miners who were laid off a fortnight ago when the cable refused to work have been put on again.

Siskiyou.

LOCATING ACTIVE.—Yreka *Union*, Dec. 11: Great numbers of notices have been put up and recorded in the various mining districts of this county claiming placer ground, quartz ledges, water-rights, mill-sites, etc.; many of the placer locations consisting of ancient river deposits situated in the high benches along the modern streams.

RICH DRIFT LEAD.—Yreka *Journal*, Dec. 10: The claim of Lee, Lash, Perlin & Co. at Greenhorn creek, about a mile south of Yreka, is paying about $25 a day to the man. The company has uncovered about 40 feet of the pay gravel, which is five feet thick at bedrock, some 80 feet below the surface of the creek bed. The prospects indicate a large extent of this gravel, as the bedrock is pitching toward the hill a long distance off and can be drained very easily with the Westinghouse steam engine and pump now in use. The men at work are drifting along the bedrock as a cheaper method than making an open cut at such great depth, with the advantage of a stratum of tough cement above the gravel to form a safe roof, although it will be timbered to make sure against any danger of caving. Wm. Huntley Hampton of Portland, a chemist and mining engineer, sent to this county by Oregon capitalists, visited this claim last Friday, and says the blue gravel taken out is exactly like the blue gravel found in Siskiyou foothills on Cottonwood creek, and many experts in mining believe it can be traced under the sandstone formations on the east side of Yreka creek as well as on the west side, from Shasta river to the head of Greenborn, as well as other tributaries and gulches draining into Yreka creek. As considerable gold has also been found lately on Willow creek, about midway between Yreka and Siskiyou mountain, great faith is entertained in the opinion that the famous blue lead extends all the way through Shasta valley from Siskiyou mountain in a direct continuation to the mining fields of the Humbug and Salmon mountains on the west side of Yreka basin and Scott Valley.

QUARTZ MINING.—Judge Spencer has secured the Magill quartz ledge in Humbug gulch, west of Yreka, and will open it on a more extensive scale. Boyle & Co. had their big sled hauled over to Humbug creek last week for hauling quartz from the mine to the mill, as the road is now covered with 14 inches of snow for a considerable distance below the ledge. The quartz is taken to McCook's mill at the forks, owing to scarcity and freezing of water supply at Boyle's steam-mill. The sled is used for transportation of the quartz to the edge of the snow-line and thence by wagon to McCook's mill. As soon as we have rain or warm weather, there will be an abundance of water for Boyle to start his mill. Myron Carrick and Archie Nichols have commenced work again for the winter in their rich quartz ledge at Spring gulch on Yreka Flats, northwest of town, from which they pounded out about $1100 last season in a band mortar, saving the average paying quartz to be taken to mill, with more to be taken out this winter. This ledge varies from two inches to a foot in thickness near the surface, but the owners anticipate it will widen out more permanently as they get farther into the mine. We have been shown some of the specimens taken out, several of which comprise more gold than quartz, plainly visible to the naked eye. The Allen Bros. at Quartz Valley have realized about $14,000 from their quartz mine during the past summer, crushing the quartz in the slow-going process of the old-fashioned Spanish arastra. Their ledge averages from 13 to 14 inches in width, and yields from about $40 to $45 per ton.

Trinity.

WELCOME RAIN.—*Journal*, Dec. 6: Last Tuesday morning a rain set in that kept up until Thursday morning, 2.92 inches of rain falling. Snow fell low down on the hills, and all around us the mountains are snow-capped. The miners are enabled to do a little work, but it is not likely that the water will hold out long enough to do much good unless more rain follows.

NEVADA.

Washoe District.

ON THE COMSTOCK. — *Territorial Enterprise*, Dec. 13: The Gold Hill Pumping Association is meeting with many obstacles in the drainage of the Gold Hill mines to the 2000 level. The incline from the Sutro tunnel level to the point of destination, so far as experienced, has to be timbered almost anew the entire distance, and the work, consuming the greatest portion of time, is not really in actual pumping, but in paving the way for the operations of the pump. The interest displayed on the street in Potosi is unflagging. It is not known whether the last strike of ore was made in a crosscut that entirely crosses and goes beyond the influence of the formation followed by the winze workings or whether it is part and parcel of the same. This reporter has not been in the mine since the new development, and, of course, he cannot tell whether the east crosscut 50 feet north of the winze on the 1130 level passed through the hanging clay wall, through porphyry and through a clay footwall into ore, or whether it has been in clay, quartz and porphyry since it started. If there is a clean separation of clay walls, with an intervening space of porphyry carrying no more metal than country rock carries, then the crosscut is in a new find, and its possibilities must be most interesting to this mining community. If the sides of the crosscut reveal the same amount of clay, quartz and porphyry that has been followed from the 930 level to its present workings, it would require a most enthusiastic Micawber to expect anything different. The winze workings and exploitations are in a most interesting formation, and connected therewith there must exist some extensive precipitation of metal, but in the opinion of the *Enterprise* such precipitation took place in chambers connected with the common debouch of the thermal spring that fed the vein, and not in the walls proper of such opening. As will be observed by the reports from the Crown Point group of mines, winter has set in and much work of exploitation has been discontinued during the past week. The reports from the Yellow Jacket group and the Hale & Norcross and Savage, and also from Chollar and Potosi, indicate a fair season's work. The Douglass mill will shut down as soon as a clean-up is made, and probably not start up again until next spring. The Ophir mill and Little Bonanza have shut down and will probably not start up until next March. Wet tailings the cause. The main shaft of the Rock Point mill broke Tuesday night. It was sent to Carson to be repaired and the mill started up yesterday. The usual amount of exploratory work is being done along the Comstock ore belt and generally with satisfactory results.

THE MINERAL WEALTH OF NEVADA.—*Journal*, Dec. 12: The Pacific Salt and Borax Co. has declared a monthly dividend of $1 per share, payable Dec. 10th. More attention should be given to the great deposits of minerals that lie in the basins of the extinct lakes of Nevada than has heretofore been bestowed upon them. All are running after mines of gold and silver and the wealth in the basins of the old dead lakes is passed by. A deposit of salt, soda and borax that pays dividends is better than a gold mine that is constantly demanding the payment of assessments.

Candelaria District.

MINING NOTES.—Walker Lake *Bulletin*, Dec. 11: It is expected that work will be resumed on the Pamlico mine some time next month. Good work is being done at the old Columbus Con. mine near Candelaria. Eastern capitalists have placed a large amount of money in the property, and under the supervision of Mr. Chas. T. Warren, it is believed the mine will soon be a dividend-payer. The property is now called the Mountain Queen. Rich prospects are being found in the Gillis range on the eastern shore of the lake. Messrs. Hanchett & Trueman have organized a company to work the famous State Line gold mine at Gold mountain. Col. Ellis of Carson City has disposed of his interest in the above mine to the new company, who are now developing the property. It is proposed to work a few men this winter, and next spring put on a large force of men and work the mine on an extensive scale. Esmeralda county has more valuable mines lying idle than any other county in the State. Capital is the only thing lacking to develop them.

FROM CANDELARIA.—The Holmes Co. disbursed about $30,000 on the 8th inst.—payday. An assay of some ore from the first intermediate in the Fountain Queen mine is reported to have gone $564 to the ton in silver. The Holmes Co. shipped six bars of bullion (6014 ounces) on the 7th. For the month of November this company shipped nearly 39,000 ounces. The outlook for a handsome output this month is excellent, as the mines are producing good ore and the mill is running like a seven-day clock, grinding up 60 tons of ore per day.

Winnemucca District.

PLACER MINING.—*Silver State*, Dec. 11: J. B. Foltz, who is a man of means and experience in mining enterprises and who during the past few months has possessed himself and others connected with him of 22 placer claims in Indian Creek valley and Spring valley, came to town yesterday and left this morning for Truckee for the purpose of purchasing lumber to construct two miles of flume to conduct the water of Indian creek to Spring valley. Mr. Foltz intends to erect extensive hydraulic works. Operations will be commenced at the lower end of Spring Valley, with the intention of working thoroughly both old and new ground. Indian Creek valley will be carefully prospected in the future, and we apprehend that this gentleman will do much to revive placer mining in our county.

ARIZONA.

GLOBE DISTRICT.—*Silver Belt*, Dec. 5: The people of Globe had reason to celebrate Thanksgiving heartily this year. The season has certainly been one of growing prosperity for our district. Mining is being actively carried on with the most encouraging results. The weather continues fine, permitting the prosecution of all kinds of outdoor work. The supply of wood and coke for the mines and smelters is increasing, and prospecting and mine development proceed rapidly. New capital is seeking investment in our mines, and Globe is now the most prosperous mining camp in Arizona.

MINERAL PARK ITEMS.—Mohave *Miner*, Dec. 6: H. P. Ewing is leaching on the Tuckahoe. Delhantey is getting some good grade galena ore on the Schuykill. Noel & Canyas are taking out some fair-grade ore on the south end of the Tintic. Steve Smith is still getting some good galena ore on his claim under Surrum's Peak. Mearra & Waggoner are doing assessment work on the Illinois. Wm. Heimrod is doing assessment work on the Copper Trust, the first south extension of the Altata, and is getting some good copper-silver ore. Gilliland, Shippey & Sherrick have leased a block of ground on the Empire, the block formerly leased by Darden & Gilliland being nearly worked out. W. Brakeman has a contract from C. E. Sherman to drive in the lower tunnel of the Distaff mine. C. E. will do considerable work on the Distaff this winter. J. P. Finnegan has struck a six-inch streak of 280-oz. silver and three-oz. gold ore in a claim his little boy found 100 feet from the door of his residence. McKinnon and Koster are sinking a new shaft on the Altata. The shaft is on another and longer lead from the one that has produced so much good ore in the past.

BRITISH COLUMBIA.

WEST KOOTENAY.—Nelson *Miner*, Dec. 7: Considerable has been done in West Kootenay during the past summer in the way of prospecting for placer. Prospectors have searched nearly every creek in the southern portion of the district, meeting with enough good luck to make them anxious for the 1st day of June, the end of the lay-over season. Near Nelson, gold in paying quantities has been found in 49, Bird, and Rover creeks, and a find was made on Hall creek that promises to yield something like the finds made on Wild Horse and other creeks in East Kootenay in the early sixties. On the Lardeaux, a river that flows into Kootenay lake from the north, diggings have been found that pay, the finders, now out at Revelstoke, intending to return this winter to make preparations for a summer's work. While the yield of gold from all these creeks will not aggregate a six-figure total, it was large enough to indicate that next year's yield will reach figures that will surprise people on the coast who believe placer mining a lost art. Some 25 Chinese are still at work on 49 and Bird creeks, having laid in supplies for the winter. One of the number reports the diggings very good, some of the men taking out as high as $5 a day.

COLORADO.

THE MOLLIE GIBSON STRIKE.—Aspen *Times*, Dec. 10: An important discovery has been made in the Mollie Gibson. The ore found appears to be part of a chute and it is of very good grade. It has only just been opened and as yet it is impossible to determine how extensive the mineral may be. The discovery is important because of the fact that it has been made south of the incline. The fault problem is still unsolved. The fittings for the diamond drill have all arrived and this machine will soon be running with three shifts. The drill will move 30 feet a day and the facts regarding the formation will be very rapidly developed.

MINES AND MILLS.—Silverton *Standard*, Dec. 6: The Cliff mine, near the Summit, owned by Jim Sheridan, is showing up some very nice mineral and Jim says he has a sure bonanza. He is also working the Summit, another promising claim. Richard Lambert, Alexander Perrino and Baptista Giadietto have taken a lease upon the Mahel mine, and are preparing to work the property this winter. The new stamps for the Victoria mill were shipped from

Black Hawk on the 26th ult. and are expected daily. The timbers are all framed and ready to put up. It will take but a few days to have the stamps dropping after they arrive. The Polar Star is taking out from 200 to 250 sacks of ore per day. The trail is in good condition and the late snow has given packers a chance to run sleighs from Animas Forks to town and catch up with the work. The mules will be kept upon the trail to January 1 anyway and later if possible. This week ore was struck in two more of the stopes which assays $161 and $214 to the ton.

IDAHO.

STRIKE IN PROSPECT.—Bellevue *Herald*, Dec. 7: The prospects are good for another big mine near Broadford. On the 8th of November, in the Modoc Chief, the miners encountered the hanging-wall of the ledge and on cutting through it came to a seam of blue clay or talc 18 inches thick, the material from which assays 70 ounces in silver and 54 per cent lead. Inside of this clay lining a solid body of glistening ore was found, 22 inches thick. The lowest estimate placed upon this ore by experts is $125 in silver and 65 per cent lead. The tunnel was continued through the ledge, which was found to be nine feet wide between hanging and footwalls.

LOWER CALIFORNIA.

GENERAL MINING NEWS. — *Lower Californian*, Dec. 5: Fielding Myers, who is an old hand at mining, shows some very fine specimens from Alamo, from ledges denounced by him. He went north last week, and will visit Julian and perhaps Pine valley before his return. He said: "Alamo is too lively and promising a camp to leave, and it will be a much better camp three years from now." W. H. Smith & Co., merchants, report an increasing trade not only here but at Alamo, where they have a branch store. The camp seems rather to be increasing its activity as winter approaches. The Mexico brought down from San Francisco on her late trip a lot of mining machinery for the Aurora Co., consisting of pump hoist, ore bucket, self-feeder, etc., and also a set of castings for the Princesa Co. Thos. Peterson, a miner, came into town Sunday night from Valladares, 50 miles southeast of Colnett, where he has been prospecting for gold. He says that the mining outlook in the Valladares district and at Socorro is fairly good. Two men from Alamo are working in an old shaft, 45 feet deep, at Valladares, and are doing well although they meet with considerable interference from water. Mr. Mathieson, a partner of Jack Barnes, is working on the old ditch belonging to the company, and is preparing to start up an arastra. Mr. Peterson states that there are five Mexicans working on prospects with good results, and that at Socorro two men are making money by working small leads.

A NEW MILLING COMPANY.—Articles incorporating the Montezuma Milling Co. were filed in San Diego last Saturday. The incorporators are Thomas Fitch of San Francisco, and Jas. H. Hill, George Kennedy, Wm. H. Furmao and W. M. Colburn of San Diego. The purposes of the corporation are the purchase, erection and running of quartz-mills, furnaces and smelters for the reduction of ores containing gold and silver, in San Diego Co., California, and on the island of Cedros in Baja California. The capital stock of the company is $100,000, of which Thomas Fitch subscribes $99,800.

RAIN AT LAST.—It is seldom that the rainy season in Lower California does not set in before December, as it has this year. Usually there are rains in October, but almost always as soon as November. The copious rains of last night have long been waited for by the farmers to prepare their lands for plowing, and now that it has come there will be busy times on the ranches as well as in the mines.

MONTANA.

ABOUT DEER LODGE.—*New Northwest*, Dec. 10: The shaft is now down on the Forest City mine about 40 feet, and they expect to strike two leads before they reach the 125-foot mark. Their neighbor, the New State, has been working on a lead that is turning out a fine quality of mineral, and the prospect is good for its being a lasting supply. There was an order issued Tuesday night shutting down the Montana Consolidated, Green Mountain, Wake Up Jim and High Ore mines at Butte. They are properties of the Chambers syndicate, and the stopping of work struck consternation to the Butte and Anaconda citizens. Marcus Daly, the chief stockholder, has stated that the suspension is only temporary and work will be resumed Dec. 12. The Gold Creek mines, Deer Lodge county, are making a good showing. The quality of rock found in these mines is very fine. It ranges in value from $70 to $736 per ton in gold. The best feature of these mines is their size—from three to eight feet. They are developed by shafts varying in depth from 50 to 80 feet. Chinamen have taken possession of the placer workings along Silver Bow creek, near Butte, which were abandoned by white men after they had gone over the grounds, during 1864 and a few years later. The celestials, however, expect to glean profitable returns from their overhauling of the placers. Dr. Hoyer has several specimens from the American-Ruby mine, which he expects to have assayed. The rock is simply prospect, but appears to have a considerable amount of mineral in it. A carload of quartz shipped from the Monarch mine, at Elliston, returned about $79 per ton, which gave its owners the net profit of $38 per ton.

MEN WANTED. — Helena *Journal*, Dec. 1: Nearly all the mining camps in Montana will be in active operation during the winter, and the majority of prospectors will seek employment in these, but they will come far from filling the quota of what is needed. Mining men state that considering the activity of the various camps there is a remarkable scarcity of men, and there is hardly a camp in which more men are not needed. Several companies in various localities have laid out extensive work for the winter, but declare they cannot carry out what they have undertaken unless they can secure more men than they have thus far been able to employ. Said an experienced mining man: "If you know of any man who wants to earn $3.50 a day, just send him out to some mining camp. We are experiencing the greatest possible difficulty in securing as many men as we want." All this augurs the most encouraging results and is but another indication that more extensive operations will be carried on in Montana the coming season than ever before.

NEW MEXICO.

MINING NEWS.—Rio Grande *Republican*, Dec. 11: Favorable reports continue to come in from Cook's Peak district. It is to-day the heaviest producer in Grant county. It is estimated that the Surprise now has fully 3000 tons of ore in sight, and Teal & Poe's Grand Central group has equally as favorable a showing. On Tuesday last Wm. Brockman brought in from the Tres Hermanas a carload of ore corresponding in character with that which he shipped some time since and which yielded by actual smelter returns 49 per cent lead and 90 ounces in silver. Geo. Wesley, also of the Tres Hermanas, has out a carload of the same grade of ore. A new strike of ore running over three ounces in gold and seven ounces in silver was made just below the junction of the Kleptomania and the Aztec veins, on the Aztec M. Co.'s property in the Pinos Altos district, one day last week. The ore body is quite large.

OREGON.

MINING ITEMS. — Jacksonville *Times*, Dec. 12: Dr. J. M. Taylor, late of Asbland, who has been dealing in mines for some time past, has bonded the Dysert gravel mine in Josephine county for $15,000. John Huffer, assisted by John Jenson, succeeded in opening a way through the caved-in debris into the long-abandoned Holman tunnel No. 1, up Jackson creek, this week. In the mud on the inside of the tunnel were plainly visible the footprints of the last man who visited it some years ago, he having gained access to it through a side drift connecting with the second Holman tunnel. The black sulphurets, which have been attracting so much attention recently, are not as plentiful as anticipated in either tunnel; but a thorough investigation will be made with a view to further development of the ledges. In the main tunnel opened this week, after passing the debris, the timbers are as sound as the day they were put in. Messrs. Miller, Martin & Beswick of Ashland have been making a careful investigation of their mine near Merlin with the intention of putting in reduction machinery.

SOUTH DAKOTA.

MINE AND MILL.—Deadwood *Pioneer*, Dec. 9: The supt. of the Caledonia mine reports stopes nearly filled in, but it will still take some time for the caved matter to settle. In looking over the mine I have come to the conclusion that it is very advisable to discuss or consider the sinking of a new shaft on the mine. All the ore now developed in the mine is a very long distance from the present shaft—some 2000 feet. To develop a new level and get at the profitable ore in the mine would require the present shaft to be sunk 150 feet deeper and a drift of about 800 feet from that level to encounter the ore body. The present shaft is too small for the work required in the mine. The timbers are all rotten and it will have to be retimbered from top to bottom. The hoisting works operating the shaft are underground, are entirely too light for present purposes and have not the power to hoist from any greater depth than the present lowest level. They frequently break now. Larger hoisting works could not be placed at the shaft as at present situated. A new shaft will open up ways to run ore on all the levels of the mine, and though an expense to sink, will economize operations in the future and be of great benefit, in fact, it will have to be done sooner or later. It will most probably compel closing the works till it (the new shaft) is in condition to operate.

WASHINGTON.

RETURNS FROM IVANHOE ORE. — Okanogan *Outlook*, Dec. 5: Three weeks ago the *Outlook* made mention of the shipment of several tons of ore from the Ivanhoe mine on Palmer mountain. The ore was treated at the Ryan smelter, and the Tacoma *Ledger* of Nov. 27th contains the following statement of the results: Manager Rust of the Tacoma smelter yesterday figured up the results on 16,521 pounds of ore from the Ivanhoe silver mine in Okanogan county. Manager Rust had the ore smelted, and the 8¼ tons averaged 275½ ounces of silver to the ton and nearly one ounce of gold. The net value of the ore smelted, figuring the silver at $1.04 per ounce and the gold at $20 per ounce, was $2250. The Ivanhoe belongs to Cowherd & Westreo, and is located in the Wanicut lake district in Okanogan county. Mr. Cowberd, who brought the ore to the city, says that he and his partner have 500 tons of ore on the dump ready to be shipped as soon as there are transportation facilities. The people of that country are praying for railroad connections, so they can ship their ore here to be smelted.

A PROMISING GROUP.—The *Outlook* mining reporter paid a visit to a group of prospects this week which, although they have heretofore attracted but little, if any, attention, owing to recent developments, are entitled to more than a passing notice. The group includes the Blue Daisy, Eureka, Washington and Silver Bell, all of which are located on extensions of leads from the famous Lone Star mine. The Eureka, which is the south extension of the main lead of the Lone Star, is a fraction lying between the Golden Crown on the east and the Blue Daisy on the west. The Blue Daisy is a full claim and joins 200 feet on the west half of the south end of the Lone Star. It is bounded on the east by the Eureka. Frank Hinds and Geo. Cooper finished assessment work on the Brunswick claim, on Mineral bill, Tuesday, and are now at work on the Last Chance. They struck some fine-looking ore in the Brunswick last week.

WYOMING.

SILVER STRIKE.—*Tribune*, Dec. 13: Wyoming's first rich silver strike is reported from the mine of State Senator Chatterton near Saratoga. The manager sends word that at 350 feet in the tunnel they uncovered a six-foot vein of silver ore and that the assays gave not less than $600 to the ton. This mine is across the Platte river from Brush creek, where gold finds have been made, and the report apparently bears out the theory that the mountains of Southern Carbon county are rich in mineral, as the range continues into Colorado.

Mining Share Market.

Mining shares the past week were fairly active at declining prices, with the exception of Confidence and Savage. The strength in these two stocks is due to the work going on in the mines. The pool succeeded the past week in not only uncovering large lines of stocks but also secured considerable cash stock—stock thrown out by holders frightened into selling, owing to assessments levied and the fear of more to follow. The Comstock shares are better concentrated than at any time within the past 12 years, and it is not at all reasonable to suppose that those who have brought intend to unload at a loss. The panic in New York and close money market in this city worked in the pool's favor by causing heavy selling—forced and otherwise—by outside holders. The situation at the mines does not warrant the decline, but on the other hand it justifies much better prices. Take for example the Gold Hill mines, drifts have been and are being run for better ventilation and also to admit of several important levels being opened up to better advantage, not only for prospect work, but also for extracting the rich ore found in two or more of the mines. The pumping out of the Gold Hill mines admits of developing below the late water line the rich ore in Crown Point, Yellow Jacket, Seg. Belcher and Overman. The ore should work up to over $30 a ton in bullion, even after allowing a large percentage for mysterious disappearance. In the Middle mines, several levels are about ready for active prospect or developing work, and it is said with every encouragement of the best results. In the 1886 deal, when prices for stocks were advanced within a few months from cents up to as many dollars, the work being done in the mines was almost nothing. Since then active deadwork has been done in all, and very little now remains, except prospecting and developing work. Since 1886 there are better milling facilities and lower charges; besides which silver is higher and no a more substantial footing, with still higher prices not at all unlikely. The Sutro Tunnel litigation has been or will be settled soon. It is conceded by the ablest financiers that the money markets here and at the East will, after Jan. 1st, work into more general ease than for several years past. Cheap money inspires speculation.

In outside mining shares, trading has been quite active in the Tuscaroras under concentrating buying. The Quijotoas have ruled weak. In the Bodies, trading has been light at declining prices. Another bullion remittance has been received from Bodie. Reliable and trustworthy parties, who are in position to know, affirm that there is very little, if any, Bodie stock out, and that the work going on in the mines is of such a character as to warrant the assertion that a very pronounced upward move in the stocks is likely to set in very soon.

The milling and transportation charges on Crown Point are $5 a ton. This is another reduction.

Annual reports of the superintendent of the North End mines are of the most encouraging character, inspiring the belief that 1891 will witness more developing work than for many years past, or since the Sierra Nevada deal.

In 1884, 1885 and 1886 Hale & Norcross was the pivoty stock, but just before the deal of 1886 the price went quite low. This year Potosi is the pivoty stock. Well-informed miners and knowing stock operators have very little faith in it, but think that when the deal commences it will be in some other stock.

News from the Comstock mines has a better tone. It now looks as if the mine managements are getting ready to confirm within the next few months what the MINING AND SCIENTIFIC PRESS has heretofore made public regarding rich ore in some of the mines, particularly in the Gold Hill group. The work on the 300-foot level in Challenge and Confidence is calculated to run into rich ore. Official letters received yesterday from Hale and Norcross, Savage, Challenge, Confidence, Crown Point, Belcher and Seg. Belcher have a more encouraging tone than for several weeks past. They even go so far as to hold out the hope of finding considerable rich ore before the summer months. In Savage, on the 1300-foot level, they are sinking on $40 to $60 ore. Con. Virginia's battery assays are steadily increasing. From the outside mines there is nothing new to report. More prospecting work is reported in the Bodies, while favorable news comes from the Tuscaroras.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 18, 1890.

General trade the past week has been quiet. Money continues to be reported close, but the future holds out hopes of an easier market than for several years past. The disbursements in January will be unusually large.

MEXICAN DOLLARS—The market is quiet at 82@83c.

SILVER—Offerings, purchases and prices paid so far this month are as follows:

Date	Offered ounces	Purchased ounces.	Price paid per ounce.
December 1 ...	891,000	566,000	$1.0075 to $1.0750
December 3....	1,301,000	321,000	1 0545 to 1.0595
December 5....	1.080,000	255 000	1 0460 to 1 0500
December 8.....	...	685,000	1.0280 to 1 0350
December 10...	789,500	395,000	1 0300 to 1 0447
December 12...	1,166,000	760,000	1.0440 to 1 0500
December 15...	918,000	689 000	1 0500 to 1.0900
December 17...	657,000	210,000	1 0750 to 1.0815
Total.....		...3,881,000	

The above, together with the counter purchases, make 4,500,000 ounces. No further purchases will be made until Jan. 2, 1891.

The silver market, while in an unsettled condition, has elements of strength which causes many holders to look for better prices later on. The demand of the country for monetary relief has had its effect on Congress, and it now looks as if more favorable silver legislation will result. While it is hardly likely that a free-coinage bill will be passed, yet it is probable that the Treasury will be given authority to purchase the surplus silver in this country. This will afford relief to the silver market and naturally bring about better prices. Bimetallists, while disposed to accept this, are still in hope of securing better legislation by having a provision inserted giving free coinage after a certain length of time. English mail advices are more favorable to silver, with the current of opinion setting in favor of the Exchequer using more of that metal. Close money markets the world over are working favorably for silver.

London cables received to-day (Thursday) quote silver at 49⅛d.

QUICKSILVER—Receipts the past week aggregate 534 flasks, and exports by sea 140 flasks to Mexico. The market holds to steady prices, under a fair demand.

BORAX—Receipts the past week aggregate 210 ctls, and exports by sea 32,950 lbs to Chicago. The market is steady at current quotations. At the East the demand is reported slower. Shipments overland the last month aggregate 8544 ctls.

LIME—Receipts the past week aggregate 4042 bbls, and exports by sea 1150 bbls to Honolulu. The demand and prices are as heretofore reported.

COPPER—The market is virtually unchanged. Close money markets the world over and annual settlements at hand are against holders. The latter express confidence in the future, with better prices looked for in the spring months. The statistical position of the metal favors holders. In last month there was shipped overland 472 ctls of copper cement.

TIN—The market for pig is weak at lower prices. Plate for both spot and to arrive is firm at full prices.

LEAD—The market for pig is lower and other kinds have an easier tone. At the East the spot market is in buyers' favor, but for distant delivery higher prices obtain. It is claimed that before spring, supplies will be under control.

IRON—English advices report a feverish and generally weaker tone to the market. At the East the inquiry is said to show an improvement which is encouraging in view of the close money markets. Our market is reported quiet, with an easy tone for both spot and to arrive.

COKE—Imports the past week aggregate 252 tons from London. The market is reported firm.

COAL—Imports the past week agregate as follows: Seattle 882 tons, Tacoma 4000, Nanaimo 1300, Departure Bay 3956, Coos Bay 700; total, 10,438 tons. The market is barely steady for coast coals. Buyers do not appear disposed to anticipate their requirements to any extent, believing that toward the last of next month lower prices will obtain. Coast collieries are making hay while the sun shines. The Tacoma *Ledger* reports a big strike in one of the mines, and also says that last winter the collieries had difficulty in meeting the home wants, but this winter they have an oversupply. The Empire mine at Mt. Diablo has made a big strike of good coal. Other mines are being opened up.

Eastern Metal Markets.

By Telegraph.

NEW YORK, December 17.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	48	1 04	$15 25	$4 12½	$21 20
Friday	48½	1 05	15 25	4 12½	21 00
Saturday	48½	1 04	15 25	4 12½	21 00
Monday	49	1 08	16 25	4 15	21 15
Tuesday	49½	1 08	15 00	4 10	21 15
Wednesday	49½	1 07	15 00	4 10	20 80

Tin is easing off. Lead is barely steady; heavy stocks of imported are against holders. Copper is slow and quotations nominal. There is a move on foot to contract the leading Lake mines' output; price named is in the vicinity of 16 cents.

MECHANICAL PROGRESS

Machines—Human and Mechanical.

New Inventions Greatly Enlarge the Scope of Labor.

Much has been said of late in regard to the influence of labor-saving machinery on the scope of labor, and it has been stoutly held by many that the present condition and future prospects of mechanics in this country are far less satisfactory than they were in the earlier history of the country, before the recent great advance in the introduction of labor-saving machinery. But the most careful-thinking people, even among our best mechanics, hold to the contrary. In consideration of this question, we would refer our readers to the following, which we clip from the columns of the Holyoke (Mass.) *Manufacturer:*

As old people fondly look back on the days of their youth, and say that such days were fraught with more of sensible and pleasurable living than is experienced by the rising generation, so do many of our veteran mechanics delude themselves by thinking that when they learned their trade, under conditions far more narrow and crude than those belonging to the advancement and greater enlightenment of the present day, men who followed mechanical vocations were better off and had more promising opportunities than they now do.

No doubt there is a good deal to make such reasoning appear plausible. Thirty or 40 years ago small machine shops were scattered thickly throughout the country, and many a mechanic, on a contracted scale, conducted an independent business for himself. Every settlement in the country had one or more clever individuals who, with the few rude tools and appliances of the times, did the "tinkering" for their neighbors. There was a deal of mechanical work done by hand, and to the old stagers it seems as if men then obtained employment more generally than in these days, in which labor-saving machinery has such extensive usage. But if they stopped to think, they would perceive that as many, if not more, individuals in proportion to the number of inhabitants, are at the present time engaged in mechanical pursuits. There has been a concentration of labor, that is all. The small shops have disappeared, but large establishments, containing new and improved machinery of all kinds, requiring for its guidance many hands, have supplanted them, and surpassed them to an immense extent in amount of work performed. It may be said, to roughly illustrate, that men now work in gangs, and under a system of concentration, whereas formerly labor was more generally diffused among individuals who worked independently of each other.

What the Grumblers Say.

The grumblers say that the mechanic is not so much in demand, and not so much respected, socially, as he once was. At the time when steamboats, railroads, and labor-saving machines were beginning to be constructed, no doubt wages were good, and the services of the mechanic held in high value. Circumstances then were such that for a time an unusually lively impetus was given to that department of labor peculiar to his vocation. The field was wide and sparsely tilled, and with no great degree of effort yielded rich returns. But after all, the methods of the time, if enterprising and vigorous, were yet rude, and of a nature necessarily so transitory that they soon yielded before more disciplined efforts and more careful, exacting and intelligent requirements. So the hasty methods of the mechanics of former days, and the few rude appliances and tools they used, did good work in their time, but would not be suitable now.

With the Growth of the Country

Machinery has increased, and the mechanic has commensurably gained in intelligence. The result is natural enough, and desirable. Now we make more devices in a day than would have sufficed for a month 30 or 40 years ago, and modifications and improvements, one after another, crowd upon each other with astonishing rapidity. The mechanics of to-day are obliged to make themselves acquainted with the manner of operating multiform contrivances, and in such connection must continually make practical application of many of the principles of natural philosophy, the laws regulating steam, etc. Who doubts that many more well-educated and intelligent men are found among the ranks of craftsmen than formerly? If anything, the community awards the best and most worthy members of this class a higher social position than that possessed by their predecessors of a generation or more ago.

Beneficial Effect of New Inventions.

Many new inventions of utility greatly enlarge the scope of labor rather than contract it. By use of labor-saving machinery many more useful fabrics and articles are manufactured, and also many new things are made which soon create new wants among the people, whose consumption of any given manufacture, when times are good, keeps pace with the increased production. Since sewing machines were invented, the average housewife probably has two new calico gowns where formerly she had one. *Labor-saving machines do not decrease the amount of work performed by people in the world; they only bring about greater results in proportion to the strength laid out in their management than manual exertion without their aid can accomplish.* The law of things is such that men may vary, facilitate and advance their undertakings to vastly wider performance, but still the generality of them, albeit under easier and more favorable conditions, must work as much as did primitive Adam in the rough country outside of Eden.

During the past few years, mechanics, in common with all other classes, have suffered much from the evils of widespread business depression. Thickly multiplying inventions have doubtless tended to create a temporary disadvantage, for inventors did not cease to construct many fresh devices, as well as make numerous improvements in old machines, up to the stagnate period of business, when the demand for all kinds of manufactures was on a scale of contraction. Nevertheless as soon as makers and inventors find that they are overcrowding the market to such an extent as to be losing or wasting considerable money in so doing, they stop manufacturing until the surplus is disposed of and the demand and supply are equalized.

But until this happy result is realized the mechanic suffers severely from lack of sufficient employment, because purchasers of machinery cannot afford to buy new tools, or improve old ones, since the demand for the goods made by these machines has likewise dropped off. Let the business of the country be once fairly revived, however, and machines, old and new, will be in active demand, and the mechanic will have no reason to complain of their influence.

There Is a Bright Future

For the skilled laborer in this country, provided only he will steadily follow the path of progress, embrace all his opportunities for improvement and advancement, and obtain a thorough mastery, practical and theoretical, of his trade. He cannot be successful if he unambitiously plods like a day-laborer and does not consider his vocation an art in which to take pride and make continual improvement. He must not stop to complain, but must endeavor to keep pace with the enlightenment of the times, must educate himself by all means in his power, and obtain superior intelligence. Indeed, it would seem advisable for mechanics in each manufacturing community to club together and establish schools in which, were they not more than an hour or two during two evenings of the week, they might acquire some geometry, the elements of mechanics, the theory of steam, magnetism, electricity, etc.

The workmen who may thus strive to obtain education and make effort to completely master all details pertaining in any way to their calling, will soon find intelligent exertions rewarded by the attainment of a good living, and an honorable position in society as well.

MAKING FISH-HOOKS.—There is a little machine which turns out fish-hooks in six strokes. Stroke number one bites off a morsel of steel wire; number two makes the loop where you fasten your line; number three hacks the other end; number four flattens and bends back the barb; number five makes the point; number six bends the wire; and your fish-hook drops into a little bucket, ready to be finished. Then it is either japanned—these are the common black fish-hooks—or they are tempered to the delicate blue that you sometimes see in cutlery. For this finish they are heated red-hot and then cooled in oil.

ROLLING TUBES FROM FLUID METAL.—We recently made a somewhat full notice of rolling rails direct from molten metal. The same principle is now about to be applied to rolling tubes and other shapes by the same general system. It is claimed for this process that by it pipes may be made by continuous action of any desired length and without seams or welds of any description. Pipes may thus be made much cheaper than by any other method and of much superior quality, as the metal must be homogeneous throughout.

ENGLISH OPINION OF AMERICAN GUNS.—Col. W. Hope of the British army, who has been investigating American naval ordnance, has returned to England. Just before leaving he said that he should advise his Government to raise the standard of its gun-making. He declared that it would be inviting national disaster to pit the present British navy gun against the ordnance now being introduced into the American navy. He closed by remarking: "The American navy guns are absolutely perfect of their kind."

IN PHOTOGRAPHING PROJECTILES in motion, no results of any importance are obtained till the velocity of the shot exceeds that of sound. But at higher speeds a wave of compression is found preceding the bullet in its flight. The shape of this wave is hyperboloid in revolution, with the apex some distance in front of the shot. Behind the projectile there is a conical wave formed, the angle of which is less, the greater the velocity.

PUTTING IN WINDOW GLASS WITHOUT PUTTY. David Crosser of Cardonia, Ind., has secured a patent on his invention of a self-locking window-sash, by which the panes of glass are easily and instantly adjusted in the sash from the inside, dispensing with the use of putty and other usual appliances for holding the glass in position.

SCIENTIFIC PROGRESS.

Glaciers—Their Formation and their March.

In high valleys, among the mountains whose tops are covered with perpetual snow, are often found seas of ice called "glaciers." They are formed thus: Snow that falls upon lofty mountains melts very little even in summer. So in valleys high up among the mountains it gathers to a great depth, and from the weight of snow lying above, the lower layers become icy, as a snowball does when squeezed. The upper crust melts a little during the heat of the day, and the water sinks down through the snow and then freezes at night. From this melting and freezing, the mass of snow is soon changed into a sea of ice.

In traveling down valleys, those ancient glaciers leave traces of their journey. Over all the places where the ice seas have passed, the rocks are rounded and highly polished. A field of these rounded rocks, when seen from a distance, looks like a field filled with sheep crouching on the ground, and Swiss geologists have called them *roches moutonnees*—"sheep-like rocks." In a valley along the summit of the Rocky mountains, near the "Mountain of the Holy Cross," there is a beautiful display of these polished, rounded rocks.

As the glaciers move down the valleys, great rocks, frozen fast in the ice on the sides and at the bottom, scratch and mark other rocks as they pass by and over them. Sometimes these scorings are very broad and deep, for the immense rocks the glaciers carry are like strong, powerful tools in the grasp of a mighty engine.

Sometimes the lines are as fine as those of a steel engraving. They usually run all one way, and by looking at the direction in which the lines run, one can tell the direction in which the glacier moved. In the sandstone west of New Haven, Conn., and in the granite of Middleboro, Mass., the deep, broad scorings can be plainly seen, running toward the southeast. The hight at which these scratches occur tells us something of the depth of the ice. Markings in the White mountains indicate that the ice was more than a mile deep over the region now known as Northern New England.

Wherever the glaciers melted, they left an immense amount of "drift," that is, sand, gravel and stones of all sorts, which had been frozen in the ice when the glaciers were forming. The stones of this drift are of all sizes. Some are as small as pebbles; others as large as small houses. There is one at Bradford, Mass., which measures 30 feet each way and weighs 4,500,000 pounds. There is another on a ledge in Vermont which is even larger than that, and which must have been carried by the ice across a valley lying 500 feet below where the stone now is, showing that the ice was 500 feet thick. Great bowlders of trap rock extend through Connecticut on a line running to Long Island Sound; and as some of the same kind are found in Long Island, the glacier is believed to have crossed the Sound, carrying these rocks with it. An immense statue of Peter the Great, in St. Petersburg, stands on one of these glacier bowlders of solid granite, which weighs 150 tons. One of the largest bowlders in America is in the Indian village of Mohegan, near Montville, Conn. The Indians call the rock "Shehegan." Its top, which is flat and as large as the floor of a good-sized room, is reached by a ladder.

Sometimes these bowlders are found perched upon bare ledges of rock, so nicely balanced that, though of great weight, they may be rocked by the hand. They are called "rocking-stones." Near the little Connecticut village of Noank, on Long Island Sound, there is an immense bowlder called by the people there "Jemimy's Pulpit." It was formerly a rocking stone, but the rock has worn away below it and it can no longer be moved.—*Teresa C. Crafton in St. Nicholas.*

Ozone and Epidemics.

Ever since the discovery of ozone, fifty years ago, by Schoenbein, and the advanced knowledge of its great oxidizing properties, chemists have struggled to solve the problem of producing ozone in large quantities. These efforts date back as far as 1857, when Werner von Siemens, the head of the now world-famed electrical firm of Siemens, of Berlin and London, constructed the first ozone tube, which has since become the basis of all similar devices where ozone is generated by electricity. As in nature, when the lightning during a thunderstorm converts the air into O_3, ozone can be produced artificially by electrical discharge on the same principle.

As the air after a thunder-storm has been found to be free from micro-organisms, this fact being due to the large amount of ozone created by the violent electrical discharges, a theory has been established by Frericha, Falh and many others that the possibility of the spread of epidemics may be due to the absence of ozone in the atmosphere. Especially after the cholera epidemic of 1871, the absence of ozone was generally observed throughout Europe, and Prof. Frerichs, in one of his lectures, said at the time that "epidemics are in some degree due to the absence of ozone in the air, or that whatever amount of ozone had been in the air had been consumed in destroying microbes. If it be only possible," continues the professor, "to produce ozone in large quantities and cheaply, every one during epidemics should drink ozone water."

With the progress of electrical science, this problem has been solved. In New York a firm has established a large plant at 86 Walker street, under the name of the Ozone Manufacturing Company, whose object is to introduce this late discovery of Siemens, both into therapeutics and the arts. A large electrical plant, producing a tension up to 14,000 volts, imitating in its process the lightning striking through the atmosphere, converts air or oxygen, passing through tubes, into ozone, and it is claimed with such results that unlimited quantities of ozone can now be cheaply produced. Ozone is used in various industries for bleaching, refining, deodorizing and disinfecting.

In medicine, strong oxidizers, such as peroxide of hydrogen, have of late been prescribed; but the specially beneficial effects of ozone seem to make it doubly valuable in prescriptions, since it is possible to have it in staple form in aqueous and oil solutions. As an antipyretic it seems to be of great promise. for Prof. Liebreich and Dr. Gottstein, of the University of Berlin, have recently discovered that ozone destroys the bacteria of cholera and typhoid fever in water. It has also been stated, by Dr. Arthur Ransome of London, that in cases of pulmonary character attended by cough, the most notable improvement, during the use of ozone preparations, consisted in the steady gain in weight of the patients treated.

Ozone water is placed upon the market in Europe under the name of electrozone, which contains about 3 per cent of ozone; and ozonol—that is, oil charged with ozone—contains about 6 per cent of ozone. In Germany, ozonol has, as a base, oil of almonds; and preozonol, a veterinary preparation, has oil of tar as a base. Both have been found to be great healing agents and antiseptics, at all times alleviating pain almost immediately.

THE SCIENTIFIC INVESTIGATION which the Government has ordered in regard to the conditions which exist in "Death Valley" is a matter of much interest to Californians in particular and to the scientific world in general. This desolate region, on the borders of California and Nevada, is only a strip of arid plain shut in between two mighty mountain walls, the peaks stretching up 10,000 feet into the burning sky. The surface of the plain is a deposit of salt and alkali. The expedition will be in charge of Dr. C. Hart Merriam, Chief of the Division of Mammalogy in the Department of Agriculture, and with him will be Dr. Vernon Bayley, one of the best collectors of mammals in the world, Prof. T. S. Palmer, the eminent naturalist, and others whose names are familiar to scientists. Many unfortunates have lost their lives by thirst in this desolate region, which owes its name to the melancholy fate of a party of emigrants who were trying to reach this State in 1852. The objects of this exploration are to locate places where water may be found; to collect specimens of animal, insect and reptile life which may be found within the valley and adjacent mountain-sides, and to collect, in general, every class of information which can be of any practical or scientific utility.

WHY LEAVES CHANGE COLOR.—The green matter in the tissue of the leaf is composed of two colors—red and blue. When the sap ceases to flow in autumn, and the natural growth of the tree is stopped, oxidation of the tissues takes place. Under certain conditions the green of the leaf changes to red; under different conditions it takes on a yellow or brown tint. The difference in color is due to the difference in combinations of the original constituents of the tissue and to the varying conditions of climate, exposure and soil. There are several things about leaves that even men of science cannot explain; for instance, why one of two trees of the same species growing side by side in the same soil should take on a bright red color in the fall and the other a pale yellow, or why one branch of a tree will turn a beautiful crimson, and the one just above or below it turn a dull brown.

EXPLOSIBILITY OF PETROLEUM.—In order to diminish the explosibility of petroleum, Korting Bros., Hanover, have devised a method which appears to be both simple and practicable. The explosiveness of petrolenm depends mainly on the degree in which the volatile carbureted hydrogen gas is mixed with the air. This carbureted hydrogen is, however, not given off by the crude oil, but only after rectification. Korting Bros. consequently endeavor to remove or neutralize it, and this they accomplish by blowing fine streams of a mixture of air, carbonic acid and steam through and through the petroleum until it is ultimately combined with it. By this treatment it is said that oil which otherwise would explode at 122° Fahr. is safe at 212°.

INFLUENCE OF LIGHT.—Italian physiologists have shown that change of tissue in animal organism is promoted by light. It is further found that the change is so slow in darkness that the ordinary reserve of nutriment stored in the body is sufficient to preserve one from starvation for a very long time.

TRACING STORMS.—Much progress has been made of late in studying the course, character and origin of storms on the Pacific Coast, and facts are being gathered and collated which will no doubt soon prove of much practical value.

GOOD HEALTH.

Medical Ethics in San Francisco and Berlin.

There seems to be a most decided contrast between the medical fraternity of Berlin and that of San Francisco. The telegraph, a few days ago, announced that a new remedy for diphtheria had been discovered by a German peasant, named Riegar, living near Berlin. Common report attached so much significance to it by reason of the great success which the poor, unlearned peasant met with in its application, that the story reached the ears of the now celebrated Dr. Koch, and friendly relations were at once established between the learned doctor and the poor peasant; and now we hear that the peasant's son has been called to Berlin and requested to experiment with the new remedy under the immediate supervision of Dr. Koch himself. The humane doctor is going to investigate and learn whether there may not be something of value to humanity in this accidental discovery alleged to have been made by a poor peasant.

What would our San Francisco surgeons and physicians have done under similar circumstances? Following the line of policy marked out and practiced by them, they would have refused all recognition of such "nonsensical quackery." They would have said to any one of their number who might have been anxious to investigate—"Hands off! Our code of ethics enforced by our Hippocratic oath forbids us to countenance any such quackery. We must stand by and let the children die of diphtheria until some one learned in medical lore shall have discovered and announced the discovery of some remedy better than any we now have."

In proof that such is the policy and practice of the medical profession of this city, we have only to call attention to the well-known fact that patients which our best reputed physicians and surgeons pronounce, beyond all doubt, afflicted with that most dreaded of all diseases, cancer, are constantly going to a well-known practitioner in this city, but one not of the dominant school, and are there being *cured* by constitutional treatment. Many of these patients, before leaving the regular faculty, submit to the cruel manipulation of the knife, and often *twice* without any beneficial effect. These facts are perfectly well known to every prominent physician in this city.

Do they follow the example of the German doctor? Not at all. They denounce in the strongest terms the practitioner—deny the cures, and when their own patients come back to them to prove what has been done, they refuse to talk with them and shut their doors in their faces!

The writer has often been asked why this is so. Why do our medical men refuse to look into this matter, so apparently important to the community? The most frequent answer is because the remedy is a secret and the profession will not experiment with a secret remedy. Herein lies the difference in practice between San Francisco and Berlin; for Dr. Koch keeps *his* remedy a secret to this day, and yet thousands of European physicians are experimenting with it.

Another equally common reason given is because the practitioner here is not in standing with the dominant school. To this we would answer, neither is the poor German peasant; yet as great and learned a man as Dr. Koch is ready and anxious to investigate as to what purports to be of benefit to the sick and suffering. The San Francisco physician is the proud pharisee who passes by on the other side, while Dr. Koch is the good Samaritan.

Then again, it is claimed, and correctly, that our friend is desirous of some remuneration for the discovery, which is contrary to medical ethics. There is nothing in the known world but medical ethics which makes such a demand. Common law, common custom and common sense say that the inventor or discoverer is worthy of a reasonable reward, especially when the discovery has been attained by many long years of investigation at great expense of money, time and health, to say nothing of the fierce opposition and obloquy which has been thrown at the effort by those who should have encouraged it, and who now demand the knowledge for the mere asking.

Further, we would reply that Dr. Koch keeps *his* remedy a secret and has already received a most princely reward in money, in addition to which honors without stint have been heaped upon him. Of course the doctor will make his remedy known to the world at the proper time. So will our San Francisco remedy be made known at the proper time and under proper conditions. There are philanthropists without number who stand ready to make good the compensation as soon as a proper medical investigation shall pronounce the cure a genuine one. Of course, time alone will prove its genuineness, but then, in the mean time, thousands are suffering and dying, while those who should investigate are doing nothing but putting hindrances in the way of investigation. That is not the way they do in Berlin.

Do they say there are no grounds for investigation? In reply, we would say that there is every day in the week waiting in a front parlor in this city, a large number of persons who have the authority of the most eminent physicians and surgeons of this city that they are afflicted with cancer. Some of these persons have been operated on in private offices and in public hospitals, and have subsequently been assured of the positive recurrence of the malady, with the assurance that the knife must again be used. These persons have afterward gone to the location referred to for treatment.

At that locality not less than twelve or fifteen has been the average number under treatment for the last five or six years—nine-tenths of which patients have been discharged as perfectly cured—*and not one single case of a return of the malady has been reported;* while when the knife is used, the books tell us that fully nineteen in twenty return within six or twenty-four months.

It has been intimated by some that these cases of cure were not cancer, but simply benign tumors. If such is the fact, what are we to say of the diagnosis of our leading physicians? Don't they know a cancer when they see it, and especially after they have cut it out, held it in their hands and put it under a microscope? Many and many cases have occurred and been successfully treated where the malady has returned after once and twice being cut out, and in one case after the third removal.

The only reasonable conclusion to which an honest-thinking man can arrive, after taking in the evidence, which is within the reach of all, is that either we have a remedy for cancer in this city or our leading physicians should be debarred by statute from practicing any longer in that specialty.

We desire that this statement should be received by our readers and the public as a most carefully considered utterance made after four years of most patient investigation, aided much of the time by medical gentlemen of undoubted standing in their profession, but whose names cannot be used in public because of the fearful professional pressure which is immediately brought to bear upon any medical person who presumes to make any inquiry into this matter of such vital interest to all. One of our medical advisers and assistants who was convinced that the discovery was a genuine one, and who attempted to bring the matter before the Medical Association of this city at one of its regular monthly meetings, was immediately put down, metaphorically stamped upon and the next day received a note that his assistance was no longer needed as a lecturer before the Cooper Medical College of this city. Others who have shown a desire to investigate have been threatened by word and by letter. The writer of these lines was present at the meeting referred to by invitation of a member of the association and was unceremoniously requested to leave the room, which he did after vainly endeavoring to make his excuse for being there. His voice was so completely drowned by the pandemonium of noise which accompanied his exit that he could not be heard ten feet from his person. We make this statement *now*, after four years of silence, as an evidence of the unseemly and unreasonable opposition of the medical fraternity of this city to allow any of their members to inquire into the truth or falsity of a medical discovery which we hold to be a better-proven reality than the alleged consumptive cure in Berlin and of fully equal value to mankind.

There are quite a number of gentlemen of standing, and several ladies also, not physicians, who have become sufficiently interested in this matter to join us in this inquiry, all of whom fully indorse the position we have taken in the matter and unqualifiedly condemn the course which our supposed health conservators are taking in regard to it.

In view of the importance of this inquiry, and the determined opposition thereto by those who should be foremost in aiding it, we appeal to the press to aid us in this work of humanity. All we ask for is an honest medical investigation. Let the State or City Board of Health or any other body of physicians select two or three cases such as they will pronounce cancer and proper subjects for the knife. Let those persons be placed under the treatment of Dr. Cook, and this vexed question will soon be practically settled. The doctor has for years been anxious for such a test. In common with all who have made inquiries into this alleged cure, we hold that the evidence fully warrants a demand for some such action, and we trust the press, not only of this city, but of the State generally, will unite with us in asking for a medical investigation.

But we have already quite overrun the space which we had allotted to this subject and will close with the remark that the name Koch is the German for the English name Cook, which latter is the name of the person who has discovered a cancer cure in this city—Cook of Berlin for consumption, Cook of San Francisco for cancer.

W. B. E.

USEFUL INFORMATION.

Taking Care of Ropes.

An article in a recent issue of the Chicago *Journal of Commerce* gives some interesting and valuable information regarding ropes, from which the following extracts are made: It is stated that the reason why it is necessary to take out the "tarns" in a new rope, and that it is untwisted when first put to work, is that in making ropes, the fibers are first spun into yarn, this yarn being twisted in a direction called right hand. From 20 to 100 of these yarns are then put together and twisted in an opposite direction, or left handed.

This forms a single strand or rope; from three to four of these strands are again twisted together, and it will be noticed that as this twisting is again in the right-hand direction, it untwists the strands and again twists up the yarn. When a weight is placed upon one end of the rope, its tendency is to untwist and become longer, and the untwisting will continue until the strain of the untwisted strand just equals the strain of the yarn being twisted together.

If it were possible, in making a rope, to put in just enough twist so that these strains should balance each other, then there would be no necessity for taking out the turns when a new rope is put to work. The greater the twist, the harder the rope, and to the contrary, a rope with little twist is much softer and stronger. The reason for this is easily seen, as in a tightly twisted rope the strain does not come as near in the direction of the length of the rope; that is, the fibers lie at a greater angle to the axis of the rope, and weight upon the rope forms a breaking instead of a stretching strain.

Ropes sometimes wear out internally while apparently sound outside. This is caused by bending the rope over a sheave. In doing this the fibers slide a small distance upon each other and eventually wear out. In the best ropes this wearing out is prevented by lubricating the strand with plumbago, mixed with a small quantity of tallow, just sufficient to hold it in place.

In designing pulleys, they should not be made less than 40 diameters of the rope; this is the limit of economical wear and they may be made as much larger as practicable. The speed of ropes may vary from 2500 to 5000 feet per minute. If five feet be taken as a minimum diameter of a pulley for a rope 1½ inches in diameter and running 2500 feet per minute, the pulley should increase one foot in diameter for each 1000 added revolutions per minute.

NEEDED INVENTIONS.—There is great need of improvements in insulating material. An insulation for wires is needed that will be cheap, light, flexible and durable; one that dampness will not decay, nor the heat of an electric arc dissolve or burn. A fire-extinguishing liquid is also to be desired which will be a non-conductor of electricity. When these have been obtained, and not until then, can the large telegraph offices be absolutely assured of protection from fire. Machines for sewing on buttons are greatly needed, but they seem to be just a little beyond our reach so far. When they come, if they do the work properly, rapidly and cheaply, they should be a pecuniary success.

TO SECURE VENEER TO ITS BASE.—A new method of securing veneer to its base consists in spreading glue or other adhesive matter between the veneer and the base, passing the two parts under a heated roller to melt the glue and cause it to enter the pores of the wood, then passing the connected base and the veneer under chilled rollers to harden and set the glue and prevent the warping or shrinking of the veneer consequent upon the gradual drying of the glue. This, it is said, will effectually secure the most obstinate piece of veneer in its place.

PROGRESSIVE KNOWLEDGE.—Some one says: At ten years of age a boy thinks his father knows a great deal; at fifteen he knows as much as his father; at twenty he knows twice as much; at thirty he is willing to take his advice; at forty he begins to think his father knows something, after all; at fifty he begins to seek his advice; and at sixty—after his father is dead—he thinks his father was the smartest man that ever lived.

THE DISCOVERER AND INVENTOR.—Mr. Edison, in a recent interview, draws this sharp distinction between a discoverer and an inventor: "I never try to discover anything—because I am an inventor. There is a big difference between a discovery and an invention. Discovery is an accident and an invention is a creation. Mr. Bell discovered the telephone; he did not invent it. I invented the talking part."

A PROCESS OF MAKING ARTIFICIAL CORK is by thoroughly incorporating 63 parts of ground or powdered cork chips with 180 parts of boiling starch paste. The resulting plastic mass is pressed in forms and then dried in hot rooms.

COLOR OF PURE WATER.—It has been quite fully demonstrated that pure, distilled water has a bluish color, independent of its surroundings.

TREES do not suffer from electric lights, as has been supposed. The electric light really aids vegetation.

SHOP NOTES.

HOW IRON WORKERS CAN STAND HEAT.—How the men employed in iron foundries and other places where big fires and blast-furnaces are in constant operation manage to stand the heat, is a mystery to all but the initiated. In the melting-room at the United States Mint the thermometer showed 106 degrees, at the gas works fire-room at Twenty-third and Market streets the mercury climbed to 118 degrees, and in front of the blast furnaces at the Baldwin Locomotive Works 115 degrees were registered. In all these places the men wore barely enough clothing to cover their nakedness. A man employed at the last-named place told a reporter that he did not feel the heat any more than did those who were walking about the streets, but he could not explain why this was the case. A subsequent interview with the weather man threw some light on the matter. "The whole point is," said he, "that these men are not reached by the humidity. They are working in places where the artificial heat is so intense as to drive out the humidity, and 118 degrees of heat in a pure, dry air is not felt so much as a mixture of 90 degrees of heat and 80 per cent of humidity that tells on people and sorely tries their vitality. The humidity is the moisture in the air. When it is very intense, it prevents the perspiration from passing out through the pores, and its pressure on the flesh is very exhausting, and the confinement of the perspiration exceedingly unhealthy. Although most people do not know it, they would be cooler while sitting beside a red-hot stove than they would be in the street on any of our warmest days."—*Philadelphia Record.*

TO PREVENT SLIPPING OF BELTS.—Edwin A. Kimball, instructor in the shops at the University of Illinois, says on this subject: "I do not know that washing soda may not be as good as castor oil, for I never used the former; but I do know that castor oil is effective and safe in the hands of a competent person. There is no occasion to soak a belt in any sort of oil. A little applied to the surface is sufficient. There is nothing that I have ever tried that is so effective as castor oil, especially for woodworking machinery belts. The way to apply it is to let it run from a bottle in a small stream on the belt while this is in motion, commencing at one edge of the belt, moving the stream over a little at every full travel of the belt, until the whole width of the belt has received its portion. I know of belts that have been treated in this way for years, and they are whole yet, and doing their work without a murmur."

KEEPING MACHINERY FROM RUST.—A mechanic says that in order to keep machinery from rusting he takes one ounce of camphor and dissolves it in a pound of melted lard, taking off the scum, and mixing in as much fine black lead as will give it color. The machinery is then oleaned and smeared with this mixture. After 24 hours, the machinery is rubbed clean with soft linen cloth, and it will keep clean for months. The same artisan gives the following method of hardening tools: Forge the tools into shape, then melt in a dish sufficient Babbitt metal to cover the end of the tool as far as it is wished to harden it. Thrust the tool into the metal and let it cool. This method makes the tool much harder than cooling in oil or tempering by any other process.

A CLEAN BLACKSMITH SHOP.—It would be worth the while of any one who always associates the idea of a blacksmith shop with smoke, soot, dirt and disorder, to inspect the blacksmith shop to be seen here. It is as free from these features as is any other part of the establishment, the walls being white, and the windows clean, everything in its place, and a general air of neatness pervading the whole shop. The entire absence of smoke is attributable mainly to the fact that the uptakes from the forges and furnaces lead into the main stack, in which there is sufficient draught to take care of it, and convey it outdoors, where it belongs.

A CORRESPONDENT of the *American Artisan* gives the tinsmiths a rule to find circumferences as follows: "This rule is of interest to those who do not know what we call the five magic figures to get the circumference of a pipe without a tapeline or a square. Take the figures following: 3, 16, 63, and multiply by 8, which means 8 inches in diameter; the correct size of the pipe without the edges will be 25 inches and 30 100 parts of an inch. Always use 31, 936. If one of the tinmen knows a better way, I will be pleased to hear it. This is intended for an 8-inch stack."

THE old-time watchmaker has gone to join the old-time shoemaker. Who gets the benefit of inventive genius there? The silver watch which retailed in 1880 at $20 now retails at $12. The set of knives and forks sold in 1883 at $6 now retails at $3. Everything in the store has suffered a reduction of from 33⅓ to 50 per cent. No gobbling up of all the benefits of improved methods there.

IF a shop hand could see how much rapping a pattern gets at a foundry he would leave out all idea of giving draught to iron gear teeth, and leave the spaces large enough so that the cast gears would not need such a cleaning-up to make them run free.

TABLE OF CONTENTS.

EDITORIALS.—The Reports of Our State Mineralogist; Salt, 393; Passing Events; Growing Popularity of Free Coinage; That's What's the Matter, 400.
ILLUSTRATIONS.—The Salt Mines of Wieliczka; Austria; 393; Scene on the River San Juan, 400
CORRESPONDENCE.—Meadow Lake District; Rich Placer Prospects in Idaho, 394.
MISCELLANEOUS.—The Gold Belt of California; The Pan-American Railroad, 394; The Sources of Nickel Supply; Death Valley; Shop Suggestions by a Cotemporary, 395.
MECHANICAL PROGRESS.—Machines, Human and Mechanical; Making Fish-Hooks; Rolling Tubes from Fluid Metal; English Opinions of American Guns; Photographing Projectiles; Putting in Window Glass without Putty, 398.
SCIENTIFIC PROGRESS.—Glaciers—Their Formation and their March; Ozone and Epidemics; A Scientific Investigation; Why Leaves Change Color; Explosibility of Petroleum; Influence of Light; Tracing Storms 398.
GOOD HEALTH.—Medical Ethics in San Francisco and Berlin, 399.
USEFUL INFORMATION.—Taking Care of Ropes; Needed Inventions; To Secure Veneer to Its Base; Progressive Knowledge; The Discoverer and Inventor; Miscellaneous, 399.
SHOP NOTES.—How Iron Workers Can Stand Heat; To Prevent Slipping of Belts; Keeping Machinery from Rust; A Clean Blacksmith Shop; Miscellaneous, 399.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 395-396.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 404.
MARKET REPORTS.—Local Markets, Eastern Metal Markets, etc., 404.

Passing Events.

Not much of special interest has occurred in mining circles during the week over which we cast a retrospective glance. While the great industry has been prospered in all its branches, there has not happened much of a startling or otherwise unusual character in any. As we have no great strikes to chronicle, so have we no painful accidents to record. All is serene and satisfactory. What ruffles the temper of the politicians and deeply agitates the commercial world creates not a ripple on the surface of the deep, steady current of mining events.

Even as we write, the clouds begin to distill from their alembic the latter rains, every drop of which the parched earth drinks up with avidity. Indications warrant us in hoping for a protracted storm. Mindful of the manner in which the first rainfall of the season failed us, ceasing before we had yet a sufficiency, our gratitude for this additional favor has not yet taken on a gushing form.

The threatened Indian outbreak seems to be in a fair way to be settled. A number of the redskins, including the wily Sitting Bull, were effectually settled in a fight that occurred between them and the Indian police a few days ago. The cold weather and the presence of the Blue Coats are likely to have a restraining effect on these malcontents.

Latest accounts from Ireland indicate a reaction in favor of Parnell, though there seems little hope that the contending factions will ever become wholly reconciled. In America public sympathy is with the great leader, who, if stricken down, will carry with him here the cause of Home Rule.

Growing Popularity of Free Coinage.

The enactment of a free silver-coinage law at the present session of Congress may now be considered certain. President Harrison, naturally conservative, and who has heretofore been a little wavering on this point, seems to have been about won over to the cause of free coinage. That he would not veto an Act providing for such measure were it to pass Congress, may be counted upon. The popularity of such movement throughout the West may be inferred from the fact that scarcely any of the members of the House who strongly opposed the free-coinage bill at the last session of Congress have since been returned to that body, their constituents having adopted this method of manifesting their disapproval of such course.

The masses of the people well understand that the money supply has not kept pace with the progress of the country in wealth, business and population; nothing can be clearer than this. It tells the whole story. The nation has grown, but the volume of the currency has stood still. These elements are out of all proportion to each other. In this prosperous and progressive republic the amount of money per capita is less than in any other highly civilized country. With us this sum amounts to only about $15; one-third and one-half as much as in France and England, respectively. We ought to increase the volume of our circulating medium at the rate of $200,000,000 per annum for several years to come, toward which we should coin our entire silver product into standard silver dollars.

The fear at one time entertained that the adoption of this policy would attract to the United States large quantities of silver from countries abroad, is shown by our experience since the passage of the silver-purchase bill to be without foundation. During the half year that has elapsed since that event our imports of the white metal have been $8,000,000; exports, $7,000,000. All this apprehended dumping of silver into the United States has amounted to, since the passage of that law, barely one million dollars, and this notwithstanding the effects of that law were largely discounted by foreign speculators in silver. What does this million dollars amount to? It is but a drop in the bucket in the finances of a country that has a money circulation of $1,200,000,000, and that produces every year over $55,000,000 of this same metal.

The truth is, this much-talked-of *dumping* process is all a delusion. These foreign nations have need of all their white metal at home, nor are they hoarding it up as is by some asserted. This is another fallacy. What silver they have is mostly in circulation. They require it for the ordinary transaction of business, more especially for effecting small change, just as we do here. They could not get along without it. The idea that silver is in any part of the world being stored in bank vaults, put away in old stockings or buried in the ground is sheer nonsense. In individual cases and to a small extent, silver, like gold, is hoarded everywhere, but in no country is this practiced in a large way, as why should it be when these metals can be loaned on good security and made to earn profits?

As the white metal has not by the passage of the Silver bill been attracted to this country in undue quantities, so has the yellow metal not been driven out of it by reason of the recent more free coinage of silver, aggregating more than three hundred million dollars, and their addition to the currency. On the contrary, gold has been coming to us and been in like manner added to the circulating medium.

With a view to removing every pretext for these simulated fears of the monometallists, the National Silver Committee has just recommended levying a coinage charge on all foreign silver that may be offered at any of the United States Mints, this being equivalent to a tariff on any such silver offered for coinage. This measure has been recommended by the committee not because they apprehend that any hurtful influx of the white metal is likely to occur, but simply for the reason above stated.

Latest advices from the East denote a general awakening on this question of enlarged silver coinage, not only in Washington but also in New York and the other great centers of finance and commerce. Not recently on any other subject has such a deep and widespread interest been excited in that quarter. At a meeting of the Republican Senatorial Committee held during the present week, Secretary Windom expressed himself as favoring the purchase and coinage of the entire surplus of silver bullion now in the country. This view having met with the approval of the committee, Senator Sherman has been instructed to draft a bill to be introduced in the Senate, the leading feature of which will be the purchase of $12,000,000 surplus silver within one year, not to exceed $3,000,000 in any one month. This will be in addition to the 4,500,000 ounces per month which the Secretary of the Treasury is now required to purchase and convert into coin. From all this it will be seen that a bill providing for the free coinage of the white metal is very likely to be enacted during the present session of Congress.

Christmas Thoughts.

Again the merry Christmas season is at hand. Again the city streets are thronged with people speeding to and from the marts which have spread new and tempting wares in the service of Santa Claus. Again the country hillsides are made to yield their annual tribute of green and scarlet, that the homes may express in evergreen foliage and bright-red fruit the ever-living Christmas idea and the ever-warm Christmas emotion.

The condition of our people and our industries favor the free outflow of holiday spirit. Peace and prosperity rule in our blessed land, while turmoil and suffering are unfortunately too prevalent elsewhere. Though we have issues which stir and excite the public mind, their settlement no longer calls for conflict and bloodshed. We have had our evil hour; let it suffice for a thousand years or until war becomes a lost art in the history of mankind. It is fitting, then, that we should make merry and be glad. It is fitting that the gentle spirit of Him whose birth we commemorate should pervade the people, and that peace, good-will and earnest thanksgiving should everywhere prevail throughout our land.

But the Christmas spirit is not one of selfish joy or self-gratification. On the contrary, it is happiness through the rich rewards of self-denial; it is reaping peerless pleasure while sowing happiness for others; it is the blissful emotion of giving—greater than that of receiving. He who gathers the most precious blessings is he who gives to those whose need is greatest, and to those who can but bestow in return only the homage of thankful hearts. Thus Christ gave and thus in a finite degree may we give also.

Thus the day becomes one to be observed thoughtfully and inquiringly. Blessed is he who provides for his own, but it is Christ-like to give gifts to those whose lives are darkened by want and whose claims upon the giver are but the angelic warrant—good-will to all men. It is our wish to emphasize this idea, which is the main spring of Christmas joy and the secret of true beneficence.

Handling Auriferous Black Sand.

EDITORS PRESS:—Will you please, if it is not too much trouble, inform me as to the best method or process for saving gold from seashore black sand that you know of and oblige an old miner.

JOHN COBURN.

P. O. Box 215, Tacoma, Wash.

In answer to the above, we may say we know of no better machine or method for saving the gold found in the seashore black sand than the common sluice with its usual accompaniments such as sacks, blankets, quicksilver, copper-silvered plates, riffles, etc. Many other machines and processes have been invented and brought into use for the purpose named, but on trial the most of them have proved so far failures, that the old-fashioned sluice and the rocker where but little material requires to be handled, still hold their place in practice.

THE annual consumption of crude iron in Germany has increased in ten years from 2,170,000 to 4,674,000 tons.

"That's What's the Matter!"

We live in an age of enlightenment and in a country notably rich in every form of natural wealth. We enjoy the advantages of liberal institutions and a free Government. Churches and schools abound, newspapers and other means for the cheap dissemination of knowledge being within the reach of all. And yet there are heard complaints among every class and on every hand. Look where we will and we see the evidence of much poverty, suffering and widespread unrest! The tillers of the soil and the toilers in the factories, the wage-payer and the wage-earner, the producer and the consumer, all are dissatisfied and clamoring for a change. Everybody is crying out for reform, an end that everybody hopes to reach by different means.

The grain-growers of the North and the cotton-planters of the South are anxious that the General Government should advance them money, at low rates of interest, on their lands and the products thereof; this done, these honest people fancy they would be prosperous and happy. As a cure for all the ills that flesh is heir to, the Nationalists would have the Government possess itself of all the telegraphs, the railroads and other means of transportation and operate the same in the interests of the people; this accomplished, the Nationalistic heart would be gladdened, and the whole world and the rest of mankind be relieved from the severer burdens of life. Intoxicants, say the Prohibitionists, are the cause of all our multitudinous woes. Stop then their sale and save the race. Give us greenbacks, say the advocates of that species of currency, and we will be all right. Adopt the free coinage of silver, exclaim the friends of the white metal, and the country is safe; gold or ruin, say their opponents. Single tax, shriek the landless disciples of Henry George, to which a great army of cranks respond, co-operation forever, community of interests or equal distribution of property being the panacea of the socialist and other proletarian bands.

Wherefore this clamor? Why this all-pervading discontent? Whence comes it and what does it mean? Let us look a little below the surface and see if we cannot detect other causes for most of these troubles than those ascribed by this vast concourse of malcontents. What about our growth in luxury and extravagance? Our costly amusements and pastimes? What about the time and the money expended in these? Looking back, is it not perceived how great has been the spread of these pernicious and costly practices of late years? How fearfully during this time has been the growth of the alcoholic, the nicotine and the morphine habit! How have the drinking saloons and the opium dens been multiplied among us, the simple beverages and healthful recreations of the olden day having been forgotten or converted into mere money-making devices.

It is now little else than a constant round of horse races, prize fights, rowing or wrestling matches, baseball or billiards, with a score of other pastimes and pleasures equally pernicious and expensive. How can a people hope to prosper whose intoxicants cost more than their clothes and their tobacco half as much as their bread? How can they hope to make money when, through the observance of holidays, holydays, fast days and Sundays, they lose fully ten per cent of their time? How can they expect to get ahead when they spend the bulk of their earnings in the indulgence of pleasure or in the purchase of articles wholly unnecessary if not absolutely hurtful? It cannot be done, and the sooner these suffering and complaining thousands come to realize this fact and act accordingly, the better for them and all others concerned. Let these deluded people emancipate themselves from their evil habits, economize their time and save their money, and there will speedily come an end of hard times. This is the true panacea, compared with which all these other reforms, even if practicable, would count as nothing. It is the case, indeed, that the inhabitants of these United States will have to largely amend their ways in the several particulars mentioned, or it will matter little to them whether these other reforms carry or not. A people who have surrendered themselves to mere pleasure-seeking and sensuality are already lost, or so near it that any effort made in the hope of saving them would be labor thrown away.

The Nicaragua Canal.

The accompanying illustration is a scene on the San Juan river, about half-way from its month at Greytown to the eastern border of Lake Nicaragua. This river flows through a beautiful country, and is at times broad and deep. The view given herewith is from a photograph taken from the deck of a river steamer. The portion of the river here shown will form a section of the inter-oceanic canal, now in process of construction. At the point of view it has widened out into quite an expanse of comparatively still water. A little beyond, it passes between two approaching hills, and is soon lost to view behind the bill on the left.

The State of Nicaragua is without doubt destined to become, at an early day, a most important field for American enterprise. All that is needed is a general and continued condition of peace between the little States which occupy this interesting and important portion of Central America. It is to be hoped that the recent unpleasantness, which appears now to have blown over, will be the last occurrence of the kind for at least one decade. With the construction of the Nicaragua canal and the consequent opening up of the country to American enterprise, it will not require a longer term than ten years to establish business relations which will act as a powerful lever in preventing war.

Nothing can exceed the beauty of Nicaraguan scenery. There is in it all the luxuriance of a tropical forest as seen on the Panama isthmus, without the deadly, fever-laden air. It would be difficult to find a more healthy or really salubrious country on the globe than the hills and valleys around Lake Nicaragua.

Since the decadence of the Panama canal enterprise and the commencement of active work on the Nicaragua canal, a very great change has been manifested in the principal Nicaraguan towns, especially those along the line of the proposed canal. Street cars have been introduced into Greytown, together with the electric light and other modern improvements. San Carlos, at the junction of the Rio San Juan with Lake Nicaragua, is rapidly assuming the proportions of a big town. Corinto, the Pacific seaport, is also growing rapidly.

A SHIP CANAL from Brussels to the sea is an old project revived by a new Brussels syndicate.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 9, 1890.

442,471.—MACHINE FOR TURNING PILES, ETC.—A. Ames, Berkeley, Cal.

442,411.—RAILWAY CROSSING—W. M. Axtell, Fruitvale, Cal.

442,419.—WATER-CLOSET VALVE—Jos. Budde, S. F.

442,184.—TREE-TRANSPLANTER—A. Harpold, Colton, Cal.

442,486.—DRESSING TOOL—S. T. Harrison, Skipanon, Or.

442,186.—MINERS' CANDLESTICK—D. B. James, S. F.

442,441.—APPARATUS FOR REDUCING BITUMINOUS ROCK, ETC.—J. B. Jardine, S. F.

442,484.—CAN BODY MAKING MACHINE—M. Jensen, Astoria, Or.

442,444.—DOOR OPENER AND CLOSER—W. H. Leavens, S. F.

442,590.—WINDOW CURTAIN ADJUSTER—D. F. McDonald, Berkeley, Cal.

442,449.—HOISTING MECHANISM—W. F. Murray, S. F.

442,244.—FEEDWATER HEATER—David Stark, S. F.

442,468.—SHELF SUPPORT—O. F. Wegener, Seattle, Wash.

442,160.—CAR COUPLING—G. H. Williams, Albany, Or.

The following brief list by telegraph, for Dec. 16, will appear more complete on receipt of mail advices:

California—Mora M. Barrett and J. F. Daly, San Francisco, governor for gas engines; Edwin Bartsch, San Francisco, syringe; John Beermaker, Santa Barbara, sea and wave power; Elswood Chaffee, Santa Monica, assignor of one-half to B. H. Fairchild, Claremont, car brake; John H. Eichler, San Francisco, rotary gas engine; Samuel C. Lewis, San Francisco, machine for making rock-drill bits; Lanthus E. Marshall, Martinez, assignor of one-third to P. Tormey, Pinole, car coupling; William Meakin, San Francisco, machine for reducing bituminous rock; Roscoe B. Paige, Oakland, wheel for road engine; Presley B. Smith, Alameda, assignor to M. Morganstern and J. A. Behr, San Francisco, fountain pen; John C. E. Stut, San Francisco, engine; William Wainwright, San Francisco, vaporizing spray nozzle; Henry B. Ward, San Diego, pipe coupling; George C. Watris and L. Heymann, San Francisco, construction of roadbeds for street railway; Frank White and F. J. Murphy, Pomona, animal trap.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RAILWAY CROSSING.—Walter M. Axtell, Fruitvale, Cal. No. 442,411. Dated Dec. 9, 1890. This crossing provides a solid foundation and connection for the different joints or sections of the broken or crossing track, and also bridges the otherwise open joints of said crossing track by making a continuous track without interfering with the use of the tracks crossed. The essential feature of the crossing is a connecting shoe or plate between the ends of the crossing rails and passing under the crossed rails, and in connection with this construction a fixed inclined plane on the crossing rail on the outside and a movable inclined plane of the crossing rail on the inside of the crossed rails, and guards which normally keep the joints closed but yield before the flange of the wheel traveling on the crossed rails. The crossing is applicable to any form of rail track.

PORTABLE HOISTING MECHANISM.—William F. Murray, S. F. No. 442,449. Dated Dec. 9, 1890. This device, which is a readily portable one, consists of a frame or base having a boiler and reversible engines mounted thereon, gipsies or winding-drums secured to a shaft journaled upon the frame, intermediate gearing whereby power is transmitted from the engine to the gipsey shaft to rotate it in either direction, racks fixed transversely upon one end of the frame, rings or links adjustable from side to side upon the teeth of the racks, and guide pulleys attached to and movable with said links to serve as leaders between the load and the gipsey, and to wind the rope fairly upon the leader.

APPARATUS FOR REDUCING, LAYING AND ROLLING BITUMINOUS ROCK, ASPHALT, ETC.—Joseph B. Jardine, S. F. No. 442,441. Dated Dec. 9, 1890. The object of this apparatus is fully expressed in the title. Its essential parts are a wheeled frame having a heavy roller at one end; the frame carries a boiler and steam engine; a series of hollow crushing rolls are mounted in a hopper and are heated by steam furnished from the boiler; a rotating conveyer is driven by the engine and said conveyer receives the material from the rolls of the hopper and discharges it at the end of the machine. The conveyer has a hollow shaft for a center and its screw blades are also hollow, both shaft and blades being furnished with steam from the boiler, whereby they are kept hot, and the casing in which the conveyer operates is also steam-jacketed. The whole apparatus is a complete and effective one for reducing the material, discharging it upon the road and rolling it.

HOMESTEADERS TO DOUBLE THEIR AREA.—It is announced by telegraph from Washington that the Senate Committee on Public Lands has authorized Senator Dolph to report favorably the bill introduced by Senator Mitchell to permit a person who has taken up 80 acres of surveyed lands under the homestead laws to extend the claim over 80 adjoining acres of unsurveyed land. An amendment was inserted to include settlers who have taken up land under the pre-emption law. Settlers may therefore look about them to see in which direction they can best extend their fences.

IT is reported that a number of wealthy Arabians purpose forming a fruit-growing and silk-raising syndicate in this country which will give employment to all immigrants from Arabia arriving in the United States.

A Most Useful and Valuable Book.

We have received a copy of a large and handsome volume, entitled the "Metallurgy of Silver, Gold and Quicksilver in the United States," being indebted to the publishers, John Wiley & Sons of New York, for the same. This book, prepared by Thomas Egleston, LL. D., Professor of Mineralogy and Metallurgy in Columbia College, is the second volume in a series of three, the last having not yet been completed by the author.

To say that this work equals any other ever published on the subject of which it treats would be faint praise. It is in our judgment the best book of the kind extant; nor can we see how it could well have been improved.

The text, clear in its statements and voluminous beyond precedent, is illustrated by numerous diagrams and cuts, an addition that tends greatly to enhance the value of the work; while sufficiently technical to meet the tastes and the views of the professional expert, the style is still so simple and the language employed so plain that everything said can be readily comprehended by the unskilled reader. Though evidently gotten up at great cost, this work is sold at the comparatively low price of $7.50. In San Francisco it can be had of the Bancrofts.

A New and Important Book on Metallic Alloys, Solders, Etc.

RECENTLY PUBLISHED.

THE METALLIC ALLOYS

A Practical Guide for the Manufacture of all Kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties and their application in the Arts and the Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by Wm. T. Brannt, one of the editors of "The Techno-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price..$2.50

☞ *By mail, free of postage, to any address in the world.*

☞ *A descriptive circular giving the full contents of the above book, together with a list of Important Books on Electro-Metallurgy, Moulding, Founding, Pattern Making, and Metal Working, sent free to any one who will apply.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 86 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

A NEW BOOK ON ASSAYING.

THE BEST IN THE ENGLISH LANGUAGE.

IT LEADS ALL OTHERS!

RECENTLY PUBLISHED.

THE ASSAYERS' MANUAL.

An Abridged Treatise on the Docimastic Examination of Ores, and Furnace and other Artificial Products. By BRUNO KERL, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent office, Berlin. Translated from the German by WILLIAM T. BRANNT, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. LYNWOOD GARRISON, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo, cloth, price $3.00. *By mail, free of postage, to any address in the world.*

Abstract of Contents: GENERAL DIVISION.—I. Mechanical Manipulations; II. Chemical Operations; III. Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth; XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium; XVI. Tungsten; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuel; Appendix; Index

☞ *A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will apply.*

☞ *The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.*

☞ *Our new and revised Catalogue of Practical and Scientific Books, 86 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

GREAT REDUCTION!

BATTERY SCREENS.

Best and Cheapest in America.

PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass. Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot Cut hurred and Slot Punched Screens.

Mining Screens a specialty, from No. I to I5 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,
21 & 223 First St., San Francisco, Cal.
JOHN W. QUICK, Proprietor.

WINCHESTER HOUSE,

44 Third Street, - San Francisco, Cal,

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families.

HOT AND COLD BATHS FREE.

Terms, Board and Room, $1.00 per Day
And Upward.
Rooms with or without Board.
Free Coach to the House.
J. POOLEY.

THE AIR BRUSH

Applies liquid pigment by a jet of air. Highest awards Franklin and American Institutes as a legitimate art tool. Successfully used by large numbers of the best crayon, ink and water-color portrait artists, and by technical draughtsmen. Saves 75 per cent of time in shading. Descriptive pamphlet sent free. It points out one way to earn a living. Address AIR BRUSH M'F'G CO., 9 Nassau Street, Rockford, Illinois.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

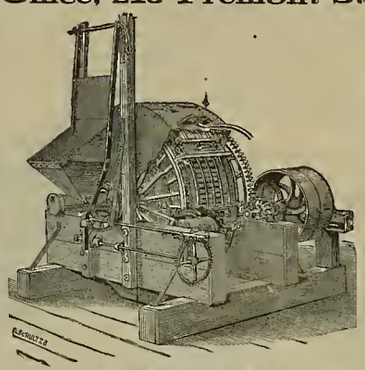
FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.

—MANUFACTURERS OF—



TUSTIN'S PULVERIZER.

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

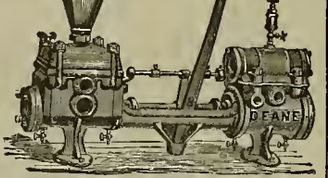
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.



DEANE STEAM PUMP.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

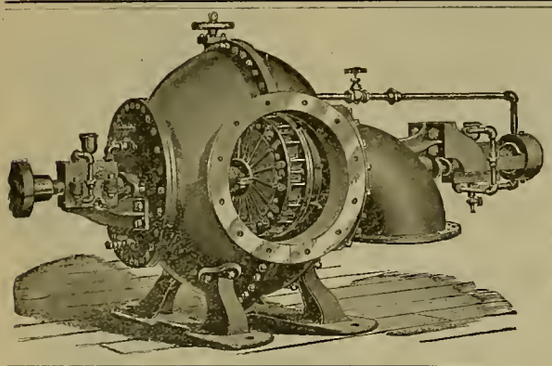
HELENA, MONTANA, Room 28, Merchants' National Bank Building, No. North Main St,

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted to capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

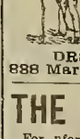
The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

COLTON DENTAL ASSOCIATION,
Gas Specialists,

Phelan Building, Parlors 6, 7, 8, 9 and 10. Entrance, 806 Market Street.

The only office in this city that makes and gives the celebrated "COLTON GAS," which has a world-wide reputation for its purity and efficacy in the painless extraction of teeth. The large quantity daily used insures the Gas to be always fresh and pure. Over 35,000 references. Recommended and indorsed by all the leading physicians, surgeons and dentists on the coast.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to disprove the igneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. O. WARD, General Agent, 64 Main Street, Visalia.



RUPTURE AND PILES.

We POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. Terms: **No Cure, no Pay; and no Pay until Cured.** If afflicted, come and see us or send stamp for pamphlet. Address:

DRS. PORTERFIELD & LOSEY,
888 Market Street, - - San Francisco

THE RUSSELL PROCESS.

For information concerning this process for the reduction of Ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

WANTED—TO BUY A SECOND-HAND TEN-STAMP Quartz Mill. Address, with price, terms, condition of Mill, L. H. MONTANYE, Secretary Golden City Mining Co., Albany, Oregon. December 15, 1890.

Assessment Notices.

LEIGH GRAVEL MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Eho Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22d day of November, 1890, an assessment, No. 2, of five cents (5c) per share was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, 320 Sansome Street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 24th day of January, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. E. FALL, Secretary,
Office, 320 Sansome Street, Room 57, San Francisco, California.

INYO MARBLE COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Keeler, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 16th day of December, 1890, an assessment (No. 11), of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, 132 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of January, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 20th day of February, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

G. W. LUCE, Secretary.
Office, 132 California Street, San Francisco, California.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages ae a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the enbjects of inventions in our own commnnity, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

— ADDRESS —

RISDON IRON & LOCOMOTIVE WORKS,

SAN FRANCISCO, CAL.

The Pittsburgh Boiler Scale Resolvent.

☞This Resolvent IS NOT AN EXPERIMENT but a FAOT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have teeted nearly all Compounde presented to us, and this one is **the only good thing we have ever used.** Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as **sulphate of lime, carbonate of lime, mud, and everything that is bad.** Very truly youre, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Mouongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Centra Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

WESTINGHOUSE AUTOMATIC ENGINES.

SALES DURING LAST FOUR MONTHS:

COMPOUND, 44 ENGINES, 5215 HORSE POWER. STANDARD, 99 ENGINES, 4500 HORSE POWER. JUNIOR, 166 ENGINES, 4260 HORSE POWER.

Grand Total, 309 Engines, Aggregating 13,975 Horse Power.

21 and 23 Fremont St., San Francisco, Cal. 189 Clarence St., Sydney, N. S. W.

CALIFORNIA WIRE WORKS

ESTABLISHED 1852. INCORPORATED 1882

MANUFACTURERS OF

Steel Wire Rope,

OF ALL KINDS FOR

CABLE RAILWAYS,
ROPEWAYS and TRAMWAYS,
Mining, Shipping & General Purposes.

WIRE,
BARBED WIRE,
WIRE NAILS,
WIRE CLOTH.

Full Assortment Always in Stock.

OFFICE:
9 Fremont Street, San Francisco.
Send for Illustrated Catalogue.

TRANSPORTATION OF ORE BY HALLIDIE'S PATENT WIRE ROPEWAY.

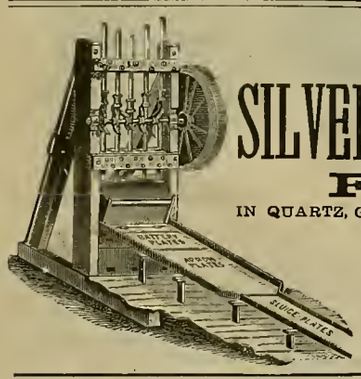
HALLIDIE'S
PATENT WIRE ROPEWAY,

For the Economical and Rapid Transportation of Ore and other material.

Erected by Us During the Past Fourteen Years in Spans of
200 TO 2,000 FEET.

Simple, Economical and Durable.

HAVE BEEN THOROUGHLY TESTED
In all Parts of the Country.



NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,
68, 70 & 72 First St., San Francisco, Cal.

SEND FOR CIRCULARS.

JUSTINIAN CAIRE, Agent,
521 & 523 Market St., San Francisco

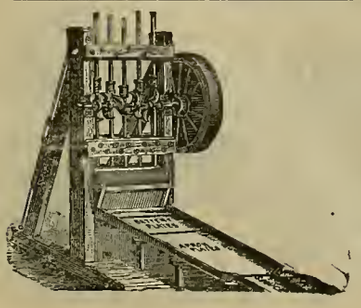
DEALER IN

Assayers' and Mining Material

MANUFACTURER OF

BATTERY SCREENS AND WIRE CLOTH

Agent for HOSKINS'
HYDRO-CARBON ASSAY FURNACES



IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated, Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

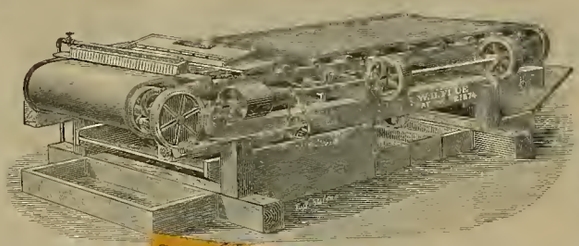
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

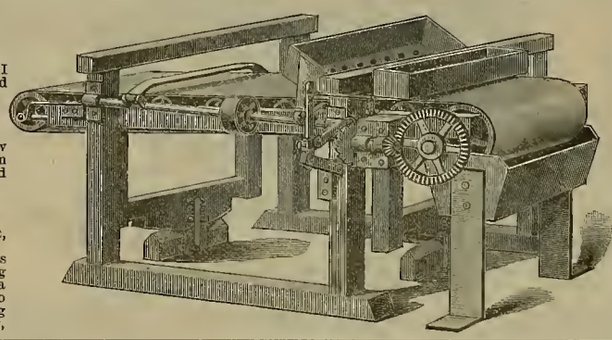
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented October 8, 1889, and December, 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD, Supt. Gold Cliff Mine.

HELENA & IDAHO GOLD MINING CO., SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6th, 1890.
MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting,



and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., Nov. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours, T. M. LANE,
Supt. Madison Mine.

Price, $350, delivered at Factory, Angels, Calaveras Co., or at Milton railroad station free of charge. For further particulars, address

JAMES TULLOCK, Angels, Cal.

AN IRRIGATING CANAL IN KERN COUNTY.

The Ennobling of Silver.

We had an interesting talk the other day with Mr. Albert Montpellier, Manager of the Grangers' Bank, on the financial situation. He called our attention to the significance of the incidents of the recent monetary crisis in England, which was averted by the shipping of $15,000,000 in gold from the Bank of France to the Bank of England. A letter from Paris, describing the incident, says:

This is the third or fourth time that the Bank of France has gone to the help of the Bank of England during the present century, and the explanation of it is very simple. The Bank of England has only one kind of metal in its safes and can only pay in gold, but the Bank of France can pay its way in silver, and so it does not have to go around borrowing gold when short of that metal. If the Bank of France is richer than its brother institution in London, it is because its vaults are filled with both gold and silver.

This chapter of French experience seems to have especial significance for us. Our growth as a country and the vastly increased volume of our commercial transactions call for an increased circulating medium. Plainly, we need more money to do business with, but we need also good money, not something which appears to be money but is not. This end could be accomplished by the remonetization of silver, that we could have both gold and silver to meet our needs, as has France.

The End of the Volume and the Year.

Having with our present issue reached the end of another year and another volume of the PRESS, we find in this concurrence of events suitable occasion for saying a few words about our labors in the past and our purposes in the future. Looking back over the year just closed, we find that it has brought with it much good fortune for this paper. Its circulation has been extended and its advertising columns well patronized, our friends having not only stayed with us, but many new ones having been gained. It is a satisfaction that carries with it something of a compliment, to know that after so many years there seems not to be need or even room for another purely mining paper in California, or indeed anywhere west of the Rocky mountains.

Construing this into an endorsement of our efforts to make and maintain a standard mining journal, we assure our friends that nothing shall be relaxed of our endeavors in that direction. Such generous recognition of our past labors brings with it not only large satisfaction but some recompense, the approval of our patrons and readers being worth to us not a little.

Finding in these expressions of confidence and good-will an incentive to still more strenuous effort, the course of the PRESS will hereafter be upward and onward, and whatever in the future may be its shortcomings, this much may be depended upon: its columns will not be lent to the promotion of any mere speculative enterprise or its influence prostituted in any shape or manner whatever. This paper, like many others, may sometimes be misled or imposed upon, but never will its proprietors knowingly permit it to be made the vehicle of misleading or imposing upon others.

Irrigating Canals.

The cut here given presents a view common in the great agricultural valleys of this State. We see here a large mountain stream which, having just debouched upon the plains, flowing between embowered banks, placid and pellucid, "glides on its soft winding way to the sea." Centrally, in the background, appear the foothills, so far off that they seem dim and shadowy, the mountains still farther back in which this river has its sources, being themselves so distant that they may not be shown in the picture. This omission the fertile imagination of the California beholder will readily supply.

The tortuous structure that comes in on the left is a flume that, having received the water from a ditch higher up, takes it down and across the river on the farming lands, where it is used for irrigation. Farther up in the foothills and mountains many of these flumes can be seen, their use there being to introduce water for driving machinery and for other mining purposes.

Chlorination.

[By WM. IRELAN, JR., State Mineralogist.]

This method of extracting gold from the auriferous sulphurets is recognized in the metallurgical circles of the Old World as the Plattner process, and is so called in honor of the inventor. The honor of its introduction and successful adaptation to the working of our sulphureted residues is due to the well-known mining engineer and metallurgist Mr. G. F. Deetken, by whom it was first brought into this country.

Owing to the expense of manipulation, cost of material, and other obstacles, Mr. Deetken had much to contend with; but his well-known skill and scientific ability enabled him to reach a successful issue and to become a metallurgical benefactor.

Since the demonstration of its successful workings on our concentrated sulphurets, a general knowledge of the manner of its application has been distributed by means of our scientific and other papers; also, books have been written by two of our well-known metallurgists, in which the whole process is explicitly dealt with.

The first of the above-mentioned works on the subject was issued by the late G. Kustel, in the year 1868, new edition 1880; and the latest exhaustive description is from the pen of Charles Howard Aaron, in 1881. Both authors were at the time of writing practically engaged in working the sulphurets of the State by this method.

The subject is inexhaustible, and of vital interest to the mining industry of our gold-bearing sections.

This article is not intended to give the detailed manipulations of the process, as the works above cited were written especially as working descriptions, and can be purchased of any of the booksellers.

The Roast.

This is the most important of any part of the process, and upon its completeness depends the success of the operation; therefore too much care cannot be exercised in this branch of the operation.

In roasting, the point to be attained is the complete oxidation of the baser metals whose soluble salts would become precipitants for gold in the leaching vat. If the concentrated sulphurets have become limpy, it will be necessary to recrush them, that the roast may secure complete oxidation.

It frequently happens that too much material is put into the furnace at one time. Mr. Aaron advises, for the reverberatory, from 10 to 12 pounds for every square foot of hearth as the correct charge. The furnace should be fired up several hours before being charged with the dry sulphurets, and the heat should be of a degree just sufficient to ignite the sulphur after the material has been evenly spread over the hearth. Too great a heat will matte the easily fusible sulphides, thereby necessitating a withdrawal of the charge from the furnace and a repulverization. The presence of galena requires a low temperature and continual stirring. Mr. Deetken discovered that the presence of lime and magnesia, owing to their affinity for chlorine, was a detriment to the chlorination of the roasted ore; but he overcame this difficulty by an addition of salt to the charge in the furnace toward the completion of the roast. The roasting in all cases should be done at a gentle heat until the sulphur ceases to burn, which point is indicated by the disappearance of the characteristic blue flame and the absence of scintillation on being raked. The heat is now increased and held at a high temperature until a thorough oxidation of the baser metals takes place. This can be ascertained by agitating, in a glass, a small quantity of the roast with water, allowing to settle, and adding to the clear decantation a few drops of the solution of ferrocyanide of potassium. If a dark-blue precipitate is given, sulphate of iron is present; if brownish-red, it indicates the presence of the corresponding copper salt; if both copper and iron are present, as soluble salts, the two colors will unite, forming a dirty greenish-blue mass. In either case the oxidation is incomplete, and the roasting must be continued until a further test does not give any of the described reactions.

Many operators continue the roasting to the oxidation of the iron only, but although it takes a longer time and a greater heat, it is advisable to also destroy the copper sulphate, as soluble metallic salts in the leaching vat react upon the iron oxide, which in turn precipitates the gold.

If the concentrated sulphurets contain silver, the Patera and Plattner processes should be combined. The silver is chloridized in the furnace by the addition of salt during the roasting. After the gold is washed from the ore, the silver chloride is leached out by a solution of hyposulphite of soda.

On the completion of the roast, the ore is drawn from the furnace to the cooling hearth, and after a time is sprinkled with water until moist enough to adhere when pressed in the hand.

The Leaching Vat.

In Europe the leaching is done in earthen or porcelain jars or tubs, wooden vats being condemned on account of their absorbing power. Mr. Deetken overcame this difficulty by coating the vats on the inside with pitch and tar. The vat is circular, and has a perforated false wooden bottom, which is raised about an inch from the real bottom. This false bottom is covered, first, with a layer of coarse, barren quartz; then a layer of smaller pieces; and lastly, a covering of clean quartz sand. Sometimes the sand is covered with gunnysacks or perforated boards. The damp roasted pulp is sifted into the vat and spread evenly and loosely until within about three inches of the top. The chlorine gas is now introduced through an opening in the bottom of the tank until it rises to the surface of the ore, which will be known by dense white fumes of chloride of ammonium being given off when a rod or stopper moistened with ammonia is held close to and above the charge. At this point the cover is put in place and carefully luted with some suitable tenacious substance that will not crack in drying. The chlorine is continued until the space above the ore is filled with the dense yellowish-green vapor; then the plug-hole in the cover is stopped and the vat and contents are left at rest for from one to two days, at the expiration of which time the gold should be converted into a soluble chloride. Before leaching, the plug in the cover should be removed and the ammonia test applied. If there are no resulting white fumes, the ore must be again subjected to the chlorine, and so continued until the ammonia reaction is given.

The chlorine is generated in a leaden vessel from a mixture of common salt, peroxide of manganese, sulphuric acid and water. The reaction chemically given is: $2\ (Na\ Cl) + 2\ (H_2\ SO_4) + Mn\ O_2 = Na_2\ SO_4 + Mn\ So_4 + (H_2\ O)_2 + 2\ Cl$.

Care must be taken in using the chlorine gas that no muriatic acid enters the leaching vat, for, besides attacking the oxides of the metals, should there be an imperfect roast, the sulphides would be attacked, eliminating sulphureted hydrogen gas, which would precipitate the gold from the chloride solution. The chlorine is deprived of the muriatic acid after leaving the generator on its course to the vat, by passing the gas through water.

Lixiviation and Precipitation of the Gold.

The ore being thoroughly chlorinated, the cover is removed and water run into the vat until it rises above the surface of the mass. After a few minutes, when the water has had sufficient time to permeate all the ore, and still covers the surface, the plug at the bottom of the vat is removed and the liquor conducted to the settling tank into which has been put the precipitant for gold—a solution of sulphate of iron. A continuous flow of water must be admitted into the leaching vat, and at no time during the operation, which lasts several hours, should the water be permitted to fall below the surface of the ore. At intervals a glass full of the liquor, after having left the leaching vat, should be taken and thereto a little of the sulphate of iron solution added; if gold were present a bluish black precipitate would be given. In the event of any precipitate resulting from the unity of the two solutions the washing is not finished but must be continued until the precipitant added to a freshly taken portion of the liquor does not give any reaction, or at the most only a faint coloration.

After a thorough stirring of the contents in the settling tank, the precipitate is allowed to subside, and a glass full of the clear liquid taken, to which is added a little of the sulphate of iron solution; if a dark coloration is given, more sulphate of iron must be added to the liquor in the tank; or, if on the addition of a few drops of gold solution to a little of the clear liquid from the tank, no reaction is given, it is a confirmation of the former test that there is a deficiency of sulphate of iron.

Should the roasted ore contain chloride of silver, it is leached with a solution of hyposulphite of soda, after extraction of the gold by water. The liquor is run into a tank set aside for this especial purpose, in which the silver is thrown down by a solution of calcium sulphide, as sulphide of silver. The outflow of the silver solution should be conducted slowly, by the closing at intervals of the discharge pipe, as the silver salt is not so readily extracted by its solvent as is the gold.

The presence of silver in the hyposulphite is known by the sweet taste of the liquid; but when it can be no longer detected in this wise, a little of the outflow is caught in a glass and a few drops of the calcium-sulphide solution added; if a dark precipitate is given, it is reasonable to suppose that the silver has not been entirely extracted, although other metallic salts, giving similar reactions, are also washed out by the same solvent. The only recourse at this point is to apply the confirming tests for such soluble compounds, as it is almost impossible to decide by the coloration which metals may be present. After the silver precipitate in the settling vat has subsided, a little of the calcium sulphide is added to the clear solution, and if a dark coloration is the result, it is evident that more of the precipitant must be added.

After the tests have shown a thorough precipitation of the gold and silver, the tanks are left undisturbed until the suspended precipitates have settled.

Silver.

The silver precipitate will settle in a few hours, when the clear solution may be drawn off, the silver sulphide collected, conveyed to a filter, washed thoroughly with hot water, pressed, dried and then roasted in a furnace—first, at a heat just sufficient to drive off the greater part of the sulphur; at this point the temperature should be increased to a dull red, and so continued for several hours, or until the greater part of the silver becomes metallic.

The partly metallized substance is placed with borax and iron scraps in a black-lead crucible and fired until thoroughly melted; enough iron should be added that it does not all disappear in the operation. If an iron rod immersed in the molten mass, and allowed to remain a few minutes, shows no signs on removal of having reduced in size, the iron scraps should be removed, the matte and slag skimmed off, and the metal poured.

Gold.

The contents in this tank should remain at rest for at least 40 hours, for under that time a complete precipitation and settling of the gold cannot be insured. When the gold has all settled at the bottom of the tank the clear liquid is drawn off, the gold collected, filtered, washed several times with hot dilute hydrochloric acid, and lastly, with hot water, until all traces of acidity are removed. The gold is now dried, melted in a black-lead crucible with borax, skimmed, base metals in a measure removed by the addition of niter, a little at a time, reskimmed and poured.

The importance of saving sulphurets and working them by this process is shown in the annual statement of the Sierra Buttes mine. From 1872 to 1885 the sulphurets were collected by the Hendy concentrator, and after exposure to atmospheric oxidation, were worked in the combination Stephenson-Patton pan. In 1885 the company erected chlorination works at a cost of $5000, by which they have added a yearly profit of $60,000 to the yield of the mine.

The ore of the Zalle mine is crushed with special reference to saving the sulphurets; the crushings being sized to pass through a No. 4 slot screen, as finer particles would be more difficult of concentration.

Exploring the Canyons of Colorado.

Colonel Holabird of Los Angeles has just returned to California from an exploring expedition in the canyons of Colorado. He penetrated districts never before explored, it is said, and found in an almost inaccessible canyon 100 miles north of Williams, and near the Grand Canyon of the Colorado, the Yava Supai tribe of Indians, who had never seen any white man except John D. Lee, the Mormon, who was shot for the Mountain Meadows massacre. Colonel Holabird, in relating his experience to a New York *Tribune* correspondent, said:

"These Indians are of the Apache family, but of ancient origin. The men are magnificent specimens. The valley in which the tribe has lived for many years in seclusion has only two ways of approach. It contains 2000 acres and is inclosed by almost perpendicular walls 4000 feet high. We traveled over 15 miles along a canyon over a lifeless country. Suddenly we came to two boiling springs under cottonwood trees. From these springs a river starts, which winds its way through a luxuriant valley. The water in the river is as clear as crystal and so strongly impregnated with lime that it petrifies everything it touches. There are three immense cataracts in the canyon. These look as if centuries ago a huge cottonwood tree had fallen across the stream and lodged. Mosses, ferns and creepers had formed a barrier; all these turned to limestone. The grass caused the deposit to increase until the barricade extends across the canyon making a fall of 250 feet. Along the front of these high cataracts limestone ridges have formed 20 to 50 feet one above the other. Over all these the water falls like a sheet of glass. Underneath, between the ridges, thousands of plants with flowers in full bloom are seen, while millions of humming birds dart in and out. The chief of the strange tribe is an old man of 60, 'Captain Tom.' The name was given him by John D. Lee. I found these Indians in a starving condition, subsisting on berries and grass seed. I appealed to the Government for them, but the Indian Department said it couldn't help wandering people." General Miles, who says he has heard of these Indians, but could never get a guide to their canyon, will investigate their condition.

SOME instructive and at the same time interesting statistics of the war are to be found in the Fox history. Out of 2,000,000 soldiers three-fourths were Americans. Of the 500,000 of foreign birth, Germany furnished 175,000, Ireland 150,000, England 50,000, and other countries 75,000. The average hight of the American soldiers was 5 feet 8½ inches. The men from Maine, Indiana, Iowa, Missouri and Kentucky were slightly above this figure. West Virginia's soldiers averaged 5 feet 9 inches. The average would have been greater had boys from 17 to 20 years not been included. Out of the 1,000,000 recorded hights, there were 3613 men over 6 feet 3 inches tall, and among them were some over 7 feet. Regiments and brigades could have been formed that would have surpassed the famous giant guards of Frederick the Great. The average weight of the soldiers was 143½ pounds. The tallest man in the service was Capt. Van Buskirk of the 77th Indiana, for whose stature the testimony is complete that he stood 82½ inches in his stocking feet. The shortest man in the army was one in the 192d Ohio regiment. He was 24 years old and was 40 inches in hight. The colonel of the regiment says he could endure exposure and fatigue with the best.

Mountain Sheep.

Nearly all the lofty mountain chains of the globe are inhabited by wild sheep, that rank the highest among animal mountaineers. Possessed of the keenest of sight and scent, with strong limbs, they live, says the St. Louis *Globe-Democrat*, secure amid the loftiest peaks, leaping unhesitatingly from one crag to another or jumping unscathed down the side of bold precipices. Although exposed to the wildest storms and most rigorous weather, they show no evidence of suffering, but apparently enjoy the best of health. Naturalists classify these wild sheep under five distinct species. There is the American bighorn, or Rocky mountain sheep; the argali, found in the principal ranges of Asia; the burrhal of the upper Himalayas; the Corsican mouflon, and the African wild sheep. To the American bighorn species belong the wild sheep of the Sierra Nevada. They are found in the Upper Missouri and Yellowstone regions to the Rocky mountains, south as far as the Rio Grande and in the ranges of Washington and Oregon. All the many mountain summits within these limits, rising thousands of feet above the sea-level, are more or less inhabited by them. Compared with the best-known domestic breeds, the wild sheep are more than twice as large, with the wool covered by smooth, soft, thick hair. The color is brownish-gray, with the under parts and haunches white and the tail black, bordered with yellow. The wool is always white, and grows in beautiful spirals down out of sight among the straight, shining hair, like delicate climbing vines among stalks of corn.

The horns of the male are of immense size, measuring in their greater diameter from five to six and one-half inches, and from two and one-half to three feet in length around the curve. They are yellowish-white in color, and ridged transversely, like those of the domestic ram. Their cross-section near the base is somewhat triangular in outline and flattened over toward the tip. In rising from the head they curve gently backward and outward, then forward and outward, until about three-fourths of a circle is described, and until the flattened, blunt tips are about two feet apart. Those of the female are flattened throughout their entire length, less curved than those of the male, and much smaller, measuring less than a foot along the curve. The average weight of a full-grown male is 344 pounds.

Another difference from the tame sheep is that the wild is bold, daring and graceful, with every bit of the body and feet as smooth and clean as the grass of the mountain pastures. In the writings of many of the earliest travelers in America, reference is made to the "big-horns." A Catholic missionary to California in 1797 tells of a wild deer with a head like a sheep, that has flesh tender and delicious to eat. Where they have long been hunted, as in the neighborhood of the passes in the California Alps, they become very shy, but in the retired wild canyons and about the almost inaccessible peaks, they are no more timid than the sheep in a farmer's field. In the months of November and December, and probably during a considerable portion of midwinter, they all flock together, male and female, old and young.

In spring and summer the full-grown rams form separate bands of from 3 to 20, and are usually found feeding along the edges of glacier meadows or resting among the castle-like crags of the high summits; and whether quietly feeding or scaling the wild cliffs for pleasure, their noble forms and the power and beauty of their movements never fail to strike the beholder with living admiration.

Their resting-place seems to be chosen with reference to sunshine and a wide outlook, and most of all to safety from the attacks of wolves. Their feeding-grounds are among the most beautiful of the wild gardens, bright with daisies and gentians and mats of purple bayanthus, lying hidden away on rocky headlands and canyon-sides, where sunshine is abundant, or down in shady glacier valleys, along the banks of the streams and lakes where the plushy sod is greenest. Here they feast all summer.

When winter storms set in, loading their highland pastures with snow, then, like the birds, they gather and go to warmer climates, usually descending the eastern flank of the range to the rough, volcanic tablelands and treeless ranges of the Great Basin adjacent to the Sierra. They never make haste, however, and seem to have no dread of storms, many of the strongest only going down leisurely to bare, wind-swept ridges to feed on bushes and dry bunchgrass, and then returning up into the snow.

In the months of May and June they bring forth their young in the most solitary and inaccessible crags, far above the nesting-rocks of the eagle. I have frequently come upon the beds of the ewes and the lambs at an elevation of from 12,000 to 13,000 feet above sea level. These beds are simply oval-shaped hollows, pawed out among loose, disintegrating rock-chips and sand upon some sunny spot commanding a good outlook, and partially sheltered from the winds that sweep those lofty peaks almost without intermission.

Like the Ibex of Europe, the Rocky Mountain sheep do not hesitate to plunge headlong down the face of a precipice and alight on their horns. The horns are so large at the base that they cover all the upper portion of the head down nearly to a level with the eyes, and

the skull is exceedingly strong; hut more often, when making a hig jump, the sheep will alight on their feet. Not only are their legs strongly muscled, hut on the hottom of the feet are hniging pade. Theee serve to hreak the shock of a jump and enahle the sheep aleo to keep their feet nn an incline.

The only animal that may fairly be regarded as a companion of the sheep is the Rooky Mountain goat, which is more antelope than goat. He, too, is a hrave and hardy climher, fearlessly accompanying the sheep on the wildest summits and hraving with him the severeet storms, hut emaller and much lese dignified in demeanor. His jet-hlack horne are only five or six inches in length, and the long white hair with which he is covered most ohscures the expression of his limhs. In some portions of the Rocky and Cascade mountains it occurs in flocks of conciderahle size, where it is eagerly pursued hy the Indians, who make uee of its ekin in various waye ae clothing, that of the head with the horne attached heing eometimee worn ae a cap.

A Model Crematory.

We have received from George Sineahaugh, Secretary of the Cremation Society of Southern Calilornia, the following deecription of the cremation furnace hullt hy that eociety, together with a etatement of the rulee and regulations by which they are governed in their dealinge with the puhlic and in the performance of the crematory rite. This etructure is undouhtedly one of the most complete and well appointed of its kind, having heen patterned after the heet modele extant.

EDITORS PRESS:—The Cremation Society of Southern California has had an exietence of ahont three yeare. A numher of citizene of Loe Angeles, realizing the importance of a more intelligent method of treating the hodies of the dead, decided to form a eociety, acquire land, incorporate, leeue etock and huild a crematory, which they have done in the Roeedale cemetery, located on the National houlevard, heing the extenelon of Washington atreet, on the western houndary of the city of Loe Angelee.

Our hullding conciete of a neat chapel conneoting with the furnace-room hy a large eliding-door. The main object of the society has been to furnieh a quick and powerful heat without allowing the flames to come in contact with the hody. No direct currents of air pass over it; the heat is still and of a temperature of ahout 2000°, doing its work in less than an hour, and permitting none of the eesential particles to escape.

The retort and furnace have heen modeled after the plan adopted hy Dr. F. J. LeMoyne of Washington, Pa., which was the first crematory hullt on the continent.

Onra was hnilt hy John L. Dye, the same person who hullt the one at Washington, with improvemente of hie own devising, which make it, perhaps, anperior to any other in the conntry, and it does its work more effectively than orematoriee ahroad that have heen hullt at ten times the cost of oure. No other crematory exiete west of the city of St. Louis. We have had ahont 40 cremations, all of which in every instance have heen highly satisfactory in their methods and results. Caskets have heen sent from along our entire coast from Seattle to San Diego, and from varlous intermediate pointe.

To those who may eend caekete from a dietance and who cannot themselves be present, we may say that all care is taken in handling hy soher, reliahle and competent men, no other helng allowed on the premieee. Many write to ne for particnlars of cost, etc., to which we give anewer as follows: The cost of cremation is eeventy-five dollare; of transportation hy hearee from depot to crematory, five dollare; of metallic hox or nrn to contain the ashes, from two dollare to a greater cost, according to the wishes of thoee interested. Bodies sent from a dietance ehould he emhalmed.

Caskets need he need only for traneportation and may he of an inexpeneive kind, and must he removed lrom the crematory within fifteen daya from delivery, or if not so removed, will then he deetroyed. In view of this determination of the aeeociation, partiee will please give notice, at the time of sending the hody, what dieposition they wieh made of the caeket.

Upon due notice heing given, the remains will he met hy the superintendent and taken at once to the chapel. Notice for heating should he given at leaet thirty-six hours in advance of the time for cremation. The ashes will he properly cared for, and eent hy expreee, ehould partiee not deeire to he preeent to take charge of them, or retained hy the company.

GEORGE SINSABAUGH.

601 Broadway, Los Angeles, Cal., Nov. 1, '90.

The Fall of Babylon.

The origin of Bahylon ie wrapped in ohecurity and its exact site was a matter of controversy nntil recent explorations nncovered the ruins of the city and disclosed material which verifies many of the etatements of the ancient historians.

According to Herodotns the city of Bahylon stood on both sides of the river Enphratee, in the form of a square, of which the sides were 15 miles each. The walls inclosed rather popnlous districts than citiee, eo that the whole population might find shelter within the space inclosed. Though the area of the city was thus large, its chief hnildings were adjacent, and it was at this part of the city that the artist chose to deplct the wonders of the city and the entrance of the invadere. It will he remembered that Cyrns the elder diverted the river Enphrates from its channel, while Belshazzar was feasting and thus prepared the way for the entrance of his men through the old river-hed which paseed heneath the walls of Bahylon. Thus the great city fell into the hands of the invader in the year 538 B. C.

THE INVASION OF BABYLON BY CYRUS THE ELDER, B. C. 538.

It was during this crowning disaster to the greatest city of the East that the artist times his portrayal. In the nncovered hed of the stream the troops of Cyrus are seen advancing, while the grounded ships are hnrned to light their pathway. On each side of the river are seen the two great palaces, while on the farther side are the temple of Bslus and, heyond, the unfinished tower of Bahel. Fire is attacking the proud structurce on all sides. In the foreground, lighted hy the conflagration, are seen the guests of the feast of Belshazzar coming forth from feasting to carnage. Upon the right is a scene in the "hanging garden;" the flight of the inmates from the hurning palace.

This "hanging garden," which is always suggested when the name of Bahylon is spoken, the Greeks regarded as one of the Seven Wonders of the World. This singular structure, which is ascribed to Nehnchadnezzar, was a square, each side of which measured 400 Greek feet. It was supported on several tiers of open arches, hullt one over the other and sustaining at each stage or story a solid platform, from which the piers of the next tier of arches rose. The top of the building, which was ahout 75 feet high, was covered with a large mass of earth, on which grew flowers and shrubs.

Lumber Business of the Northwest.

"The lumher husiness in this country," said a prominent millman, "is not what it is generally thought to he. Money invested in the husiness in Minnesota, Wisconsin, Michigan and Pennsylvania gives much greater returns than in this country.

"I have heen in the husiness in this State now for several years, and formerly was so engaged in the Eastern States, and when I make the above assertion I know what I am talking ahout. True, there are a great many companies that have hecome immensely wealthy hy manufacturing and handling Washington lumher, but again there are many who have lost, and even were compelled to withdraw from the husiness. The reason is not hecause of the scarcity of timher or hecause of its quality, hut for the want of a market. All of the mills cannot find a local market. The few centers of population do not consume sufficient to keep them all going, and as a result competition in the local market has made the husiness unprofitahle. Some few of the exporting firms are making money, while others are not. Lumher sent ahroad is suhject to foreign prices, and at times the consignments may result in large profits, while at other times they result in a loss. The marine tonnage at present is insufficient, and no increase in the export trade can he made, and as a result the immediate improvement of the industry cannot he looked for. In order to do an exporting husiness, large capital is required; the many small mill companies are compelled to depend entirely on the local market.

"And again, another thing that tends to make the husiness less profitahle here is the large wages paid. The wages paid here to the common laborer ahout a mill, up to the superintendent, are ahout 40 per cent more than in the East. This in a year's time amounts to a hig item; and then again, the machinery required in the mills here is of a much more expensive nature than that used East."—*Seattle Press.*

HOW TO TRANSFER PRINTS FROM NEWSPAPERS TO GLASS.—Varnish glass with gum dammar. Soak print in water. When varnish is nearly dry, rub on the wet print and allow it to dry. When varnish is hard, rub off paper with wet finger.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alpine.

GOLD FIND ON EAST FORK OF CARSON RIVER. Genoa *Courier*, Dec. 20: For years the fine float gold along the East Fork of the Carson river has attracted the attention of prospectors in that locality, but only a few have found gold enough to remunerate them for their labor. Prospectors have scanned the hills from the place where the Carson river emerges from the mountains up as far as Silver mountain, in a vain effort to find the fountain head—the main ledge from which the float gold is supposed to have come. It was something like a year ago that Marshall Willard told this writer that he had his eye on a spot that he believed would lead to the coveted ledge. Mr. Willard says that about two years ago, in company with his partner, J. K. McDonald, and Orson West, he came down the river and camped at Horseshoe Bend. At that point Mr. Willard prospected the croppings of a ledge, and out of 22 horns taken from different places across the ledge he got 20 good prospects. A short time ago Mr. Willard made further prospects, and interested over 20 people in the valley, who joined with him in locating 11 claims, which take in a scope of three miles along the river, Horseshoe Bend being the center. Mr. Willard describes the ledge as running 15 degrees east of south and 15 degrees west of north. The croppings show it to be from 18 to 20 feet wide on the surface, and lying back of a lime formation which contains traces of quartz. The ledge matter consists of iron and quartz mixed, and he believes it will be considerably decomposed when depth is attained. The river cuts entirely through the ledge in places and shaves it at other points. Wherever the river has exposed the ledge, signs of placer mining can be seen a short distance below. The rock closely resembles the croppings of the Willard & McDonald mine, which has been worked with great success.

Amador.

MINING NOTES ALONG THE MOTHER LODE.—*Ledger*, Dec. 20: The South Spring Hill Co. has commenced sinking, with the intention to go 200 feet deeper and explore that portion of the claim adjacent to the shaft. A new shaft is to be sunk between the present shaft and the mill, which will greatly facilitate operations, by avoiding running the rock such a distance underground. It is reported that the company have purchased the Median mine which joins the South Spring Hill on the east. This makes three claims under one management, as the Talisman has been owned by them for years. Another ten stamps have been added to the mill, making 40 stamps in all. The Keystone mill is idle, but is expected to resume operations before long. The Gardner mill started up again last Monday with a full force of men engaged at the mine. The effect of the new developments in litigation concerning the Amador gold mine is a matter of general discussion around Jackson. One object of the suit by the New York parties is to stop the sale of the property under execution. Some of the claims are represented by mechanics' liens. It is thought that these at least will hold, no matter in whose favor the question of title is decided. However, the outlook is that the property will be tied up in the courts for years. The rich vein struck in the Plymouth Consolidated is said to have widened out. Another body of ore, equally rich, and of larger dimensions, has been discovered. The prospects are so encouraging that the mill will likely be started before long.

FROM VOLCANO.—The Volcano Tunnel Co. have received a new engine and are now erecting an additional derrick. Under the able management of Supt. J. Eckart, work is pushed vigorously, and everything is in readiness for the coming rains. The indications for a profitable run this season are bright, provided a sufficient amount of water is at their command. J. Largomasini, whose gravel claim is situated near town, commenced hydraulicing this week with fine prospects of a good clean-up. Mr. Christenson, owner of the French mine, intends to sojourn at the bay this winter, but will return in early spring. We hope that this genial gentleman on his return will commence active operations at his mine and infuse some new life into our town. Forty-nine Flat, about 4 miles north of town, has received some attention from mining men lately. Antone Reale, our newly-elected recorder, who is one of the owners of a claim in that locality intends to work it on a more extensive basis, having met with fair encouragement of late.

Calaveras.

MORE REMAINS.—*Chronicle*, Dec 20: Four more of the entombed miners in the Utica mine were discovered by the rescuing party last Monday and were buried the following day in Protestant cemetery at Altaville. They were followed to their last resting-place by a large number of the employes of the mine, and religious services were held at the cemetery by Rev. Goodsell of Murphys. Three bodies were identified as William Vincent, John Bray, John Segala, the fourth being beyond recognition. Four bodies are still in the mine, 16 being entombed at the time of the accident. It is now thought that the remaining bodies will soon be discovered.

Del Norte.

BEACH MINING.—*Record*, Dec. 18: Messrs. Lhote and Raymond, who have been staying in Crescent City for several weeks, received by the last steamer an engine and machine to work the black sand beach mines in this vicinity. They have secured the rights to work the ground and will have their machine in operation in the course of a week or ten days. The machine has been tried at Santa Cruz, where it proved a success, and they are confident it can be worked to advantage here. They represent a San Francisco company, and if the result is favorable, a revival of beach mining may be looked for in Del Norte county.

Nevada.

GENERAL MINING NEWS.—Grass Valley *Union*, Dec. 19: The west drift in the No. 2 level of the Coe mine is opening up finely, the ore being of good milling quality. The west drift on the No. 5 level has been started. Good-looking ore is beginning to show both in the east and west drifts of the Manhattan mine on the 280-foot level. The south drift on the No. 3, the lowest level of the Hartery mine, shows a strong vein of good ore. The mine is doing well, making a profit regularly over expenses. A large part of the machinery for the extraction works is now on the ground, to be put in place as fast as possible. The Idaho Co. will sink a shaft north of what has hitherto been considered the lode line. It is now a well-established opinion that the croppings indicate the true line of the Eureka-Idaho-Maryland lode. The tunnel at the Delhi is in 1075 feet, being for the last 45 feet of that distance on the ledge formation. At the St. Gothard, which is on a vein parallel with the Delhi and 600 feet to the east, the tunnel which is in 1500 feet last week tapped a five-foot ledge of fine-looking ore; 300 feet of backs can be obtained by this tunnel. At the Enterprise the 100-foot tunnel run to give air has struck the ledge 100 feet below the croppings, and it is a good 2½ feet in thickness.

Mono.

SHIPPING CONCENTRATES.—*Enterprise*, Dec. 20: A carload of concentrates from the Standard mine, Bodie, was shipped hence last Saturday. Superintendent Macy was also a passenger for tidewater. He is much pleased with the future prospects of Bodie.

Plumas.

BROWN'S HILL.—*Mercury*, Dec. 20: The mines in this vicinity are panning out rich, the Brown's Hill Mining Co. having struck dirt that pays $25 to the car. G. W. McMillan last evening picked up a nugget which weighed 5½ pounds—the largest piece ever found in the mine. Wm. Wheeler and W. W. McMillan, two Butte county boys, are partners in a rich claim here, and will soon be two of the wealthiest miners in Plumas county. The Perkins & Higgins mine has closed down for the winter. It is reported that they will work a three-shift crew next summer. The Phelan & Kittrick mine has also closed for the season after a successful run. Operations will soon be commenced on Cammel's Diggings. Stewart and Deburk expect to take out as much of the precious stuff as a mule can carry, in the spring. Jake Moore will have several quartz-mills grinding rock in his mine by spring. A. Ross, of Pinkard creek, is going into the mining business on a heavy scale and he has good prospects, too.

BIG NUGGET.—Greenville *Bulletin*, Dec. 19: At his mine on Rush creek on Sunday last, Chas. Hepler found in a sluice-box, a gold nugget weighing about $195. It was taken from what is called the Edman drift claim. Mr. Hepler and his associates own about a mile of the channel from which this nugget was taken.

San Diego.

THE OUTLOOK.—Julian *Sentinel*, Dec. 19: The mining outlook is brighter to-day, and more substantial work is being accomplished. There are more men employed, more capital invested, more inquiry concerning the camp and more bullion being taken out than at any period in the history of the district. Moreover, the movement of capital this way has only just begun. With the opening of spring will come a rush that will attract the attention of the entire coast. The Gold King Mining Company are rushing their ore down to their new mill, which is nearing completion. They will start the mill about the 1st of January, and another 10 stamps will add their products to the bullion now going out of the camp. We know of 20 more stamps that will soon be pounding away on rich ore.

Shasta.

MINING NEWS.—*Democrat*, Dec. 19: One of the oldest Comstock miners was here this week, and is now traveling and negotiating the purchase of mining property. He cheerfully expressed his opinion as to Shasta county mines. He says he believes the southern slope south of Mt. Shasta will produce, when developed, the best paying mines in Northern California. He expresses his surprise at the excellent prospect the veins have on the surface and that so few ledges are in course of development. The Keystone Company is still pegging away, sinking upon a 3½-foot ledge. Mr. White is taking out some good ore on the east end of the White Oak mine. Harry Paige has discovered a large ledge south of Shasta, on the Richardson road. Some of the ore assays $300 per ton and does not contain a color of free gold. The Gleaves mine, on the same ledge as Paige's, assays from $32 to $1137 per ton.

NOTES.—Shasta *Courier*, Dec. 20: The sale of a group of quartz mines on Dog Creek, near Delta, has given renewed encouragement to ledge-owners in that vicinity. Jos. E. Bell is opening out what promises to be a very rich mine a few miles west of town. Morris Mehon is superintending the work. James Sutherland is working a quartz ledge just west of town, and shipping ore to the Selby Smelting Works at Vallejo Junction.

Siskiyou.

FROM THE MINES.—Yreka *Journal*, Dec. 19: The blue gravel diggings of Lee, Lasb, Perlin & Kenyon, at Greenhorn creek, continue to attract much interest, and may be the forerunner of opening up the creek-bed and surrounding country on a more extensive scale, for reaching the deep underlying blue gravel not yet disturbed on account of the drainage required. The red cement pays good wages and the blue gravel is exceedingly rich, yielding from $10 to $20 per day to the hand. The blue gravel lead extends under a hill, and it is believed this hill is a slide from the high mountains beyond. Parties who have been investigating the course of the blue gravel area, think it extends all through this section between the sandstone formations in Shasta valley and the quartz vein and rock formations of the Humbug and Salmon ranges of mountains along the west side of Yreka and Scott valley, having been found at various points all the way from Jacksonville, Or., to the southern borders of Siskiyou, Trinity and Shasta counties. The Klamath river miners are making arrangements for extensive operations next season, having been unable to do as much successful mining this year as usual, on account of the destruction of the wagon-roads and mining apparatus by last winter's extraordinary floods. The Chinese Co., working the Bentz claim near Honolulu, has undoubtedly taken out considerable gold this season, parties estimating the amount at about $18,000, as the Chinese refuse to tell. The McConnell claim, at mouth of Humbug creek, has paid very well, but the expenses have been very great in rebuilding houses and dams washed away last winter. George Simmons, an energetic river miner, is now procuring a large quantity of lumber for the purpose of operating the old Kanaka claim next season, and the Centennial Co. is also preparing for a long run of successful work next summer. Carrick & Nichols are now sinking down on their rich quartz ledge at Spring gulch, about a mile north of Yreka, which is gradually widening and producing better average paying quartz than the surface croppings. They feel confident of having struck a permanent ledge, and will continue to pound out the rich specimens in a hand mortar, and store away the average quartz for hauling to the mill when sufficient is taken out for a good run of crushing. The Spencer mine at Humbug creek continues to yield good pay, and seems to give promise of being extensive. The quartz is hauled to McCook's mill at the forks for crushing.

NEVADA.

FROM THE MINES.—*Enterprise*, Dec. 18: The Cortez mining property is the most valuable, all things considered, in the State. While the mines are situated three-fourths of a mile in Eureka county, the mill, assay office, blacksmith shop, three large stables, store, and hotel are some 1400 feet in Lander county. It is conceded the monthly profits of the Cortez plant are in the neighborhood of $30,000, and everything is done on a cash basis. The smelter at the Pioche is handling 50 tons of ore daily, turning out five tons of bullion of 800 ounces of silver to the ton, the rest being lead. The gross returns are about $1500 per day. The mining outlook for next season in this section is good. This is independent of the passage of a free-coinage measure, which would make it still better. The Richmond Co. at Eureka, Nevada, recently put ten miners at work on day's pay to prospect during the winter for new ore bodies. There is believed to be some good ground in the mine. Some rich mining strikes have been made near Belmont recently. Some good silver-lead properties on White Pine mountain are for sale. The Eureka Con. will start up another furnace as soon as a full supply of coke is received.

Washoe District.

THE WEEK'S WORK ALONG THE COMSTOCK.—*Territorial Enterprise*, Dec. 20: The south drift from the Chollar incline on the 1200 level is out 637 feet, and the face is in fair-grade ore. This ore is believed to be the downward continuation of the ore being prospected on the 1130 level by the Potosi winze workings. The water level of the Crown Point incline before pumping began was 30 feet above the 1500 level. The water is now 110 feet below that point. But for the extensive timbering and repairs needed in the incline as progress is made, the water could be drained fully as fast again. The water is being drained in the Gold Hill mines from the Imperial on the north to the Alta on the south. The increase in the flow of water in the Sutro tunnel since pumping began is about 30 miners' inches. This is a rough estimate, as miners' inches of water is a very indefinite quantity. The following information has been gathered from the weekly letters of the superintendents:

ALTA.—Stopes yielding usual quality of ore and mill crushing about 315 tons of $18 rock, as per battery samples.

YELLOW JACKET.—Doing extensive prospecting work throughout the mine and milling about 60 tons of $18 ore daily, as per battery samples.

IMPERIAL.—West crosscut No. 2 on 1000 level is out 122 feet, having been advanced 30 feet; face in quartz having no value. This is the only prospect drift being run. Work on the upper levels confined to overhauling old stopes, where are finding some bunches and streaks of fair ore.

CROWN POINT.—Are extracting from the 1800 stope about 15 tons of ore per day that assays from $18 to $20 per ton.

BELCHER.—The 1400 west crosscut is out 29 feet, and the face is in quartz of low grade. Shipped to the Vivian mill during the past week 247 tons of ore, average battery assay of which was $18.52 a ton.

GOULD & CURRY.—200 level: Northwest drift has been extended 15 feet; total length, 135 feet. 400 level: West crosscut No. 1 has been cleaned out and repaired 390 feet; total distance 583 feet. The northwest drift has been cleaned out and repaired 231 feet. All work in the old stopes stopped for the present.

KENTUCK.—The week has been occupied in timbering and repairing the main shaft where it was found necessary. So far 85 feet of the south compartment have been completed in a substantial manner.

OVERMAN.—Extracted 383 tons of ore. Shipped to the Brunswick mill 384 tons 1500 pound of ore. Battery assays average $17.74.

ANDES.—During the past week north drift, 420 level, was extended 17 feet; formation, porphyry, clay and quartz. South drift, 420 level, was advanced 18 feet; formation, clay and porphyry.

SAVAGE.—We have hoisted 594 cars of ore from the 300, 400, 500, 600, 750, and 1300 levels; shipped to the Mexican mill 362½ tons; ore milled, 525 tons; average battery assay, $16.27 per ton. We have commenced sinking in the ore body from the track floor of the 1300 level. A winze started from this level is now down 17 feet in ore of good quality. We are doing the usual amount of prospecting, bulkheading and repairing on the several levels.

POTOSI.—East crosscut No. 2, 100 feet north of the winze, 1130 level, is out 85 feet, and is passing through stringers of ore. East crosscut No. 3, 150 feet north of the winze, 1130 level, is out 10 feet; face in porphyry. North lateral drift from Chollar incline 1200 level, is out 637 feet; face is in fair-grade ore.

ARIZONA.

MOJAVE COUNTY.—*Miner*, Dec. 20: A custom mill has been built at Todd Basin which will benefit local miners, and the mining outlook for the county was never better than now. The mining interests of Northwestern Arizona are specially prosperous. The *Miner* says: The sale of the Mayflower group of mines adjoining the Vekol, to the St. Louis syndicate of which Mr. R. J. Compton is president, is a future deal. It will lead to the development of what is generally considered to be an excellent piece of property.

COLORADO.

PITKIN COUNTY.—Aspen *Times*, Dec. 17: Nearly $100,000 had been expended on the Little Annie, Eureka and Juda, when Mr. Wheeler took up the financial fight and search for pay dirt. Nearly $30,000 has been produced, and the mine will now soon rank with the best. The people of Aspen should own all the stock of this mine.

THE GOOD THUNDER.—The bonanzas recently opened by the Good Thunder are now the wonders of Tourtelotte park. On the north lease, the bins, holding 600 tons, are piled full to the roof, although all of Holbrook's teams have been busy hauling the ore away for ten days. Manager Murphy declares that the ore bodies are the largest he ever saw anywhere. It is all pay and is shipped without sorting.

A FAMOUS SPECIMEN.—Cowenhoven & Brown have in their office a specimen of ore from the Aspen mine, which is one of the finest that ever came from that property. It weighs in the neighborhood of 150 pounds, and will assay between 4000 and 5000 ounces per ton, with perhaps 50 per cent of lead. The dirt that was washed off in cleaning the specimen assayed over 3000 ounces.

A BIG DEAL STOPPED.—It is not generally known, but it is a fact that when the London panic occurred it put an end to negotiations that would have resulted in the biggest mining deal ever known in Colorado. The negotiations were being conducted by Messrs. Hagerman & Davis, and had for their object the sale of a number of the most valuable Aspen mines to an English syndicate. The properties that were embraced in the proposed deal cover nearly all the lower part of Aspen mountain, and if the trade had gone through, some $13,000,000 would have changed hands in the transaction.

LOW PRICE OF LEAD.—Georgetown *Courier*, Dec. 20: The ore market is more complicated. It is probable that the smelters will quit buying lead ores for a time. The drop in the price of lead in the past 30 days is frightful. The only marketable material will be dry ores, and for this the miners can get but 90 per cent with an enormous smelting charge tacked on.

MINING PROGRESS.—Georgetown *Courier*, Dec. 20: An effort is being made to resurrect the Golden Smelting Works. Dan Doyle is pushing developments on the Claybourne with a very promising outlook. H. C. Cowles & Co. had a mill run this week from the Maud S. which returned $51 to the ton. The large Aspen mines will keep their men employed on development work during the panic in the ore market. In the 165-foot level west on the Monitor, a vein of yellow copper ore, 18 inches in thickness, has been opened up which will mill from $100 to $125 to the ton. J. Donaldson & Co. have discovered what is thought to be an extension of the Pennsylvania mine in Peru district. They have stripped a 14-inch vein of solid mineral at grass-roots. The Pueblo *Review* says there is some talk among the buyers of making the silver price 93 per cent instead of 95 per cent cent as heretofore, in view of the fact that only 95 per cent of the white metal is saved by a lead smelter. The shipment of ore from the Silver Glance mine to Pueblo brought better prices than was anticipated. The smelters pay 95 per cent of New York price, and the smelting charge on dry ores is $15 per ton.

IDAHO.

OWYHEE COUNTY.—*Avalanche*, Dec. 18: The mill and concentrators at Flint have now been running nearly a week and appear to be fulfilling all that was expected from them. The first ore run through assayed 17 ounces in silver. An assay of the concentrates shows their value to be $360 per ton. It is scarcely three weeks since Messrs. Longmaid & Co. purchased the Stormy Hill mine, but in that time they have put up a small hoisting works, have piled up a winter's supply of wood and mine timbers, got a boarding-house running and now have a double shift of men busy at work enlarging and retimbering the shaft. The Trade Dollar mine, of which we wrote flatteringly last week, still continues to merit all we said concerning it. It is reported that James Shaw has struck it rich in his Cumberland mine on War Eagle mountain. The mine lies parallel with and only about 100 feet east of the once famous Golden Chariot.

LOWER CALIFORNIA.

ALAMO.—*Californian*, Dec. 18: Not much noise is being made about Alamo, but it is generally conceded that more gold is being produced than at any time in its history. The encouraging aspect of every mine as depth increases has made the development much more rapid. The Princesa Company under Supt. Rodda is forging ahead and some of its properties are now invaluable. The Princesa mine is producing better rock, and at a greater depth, than ever. The Ulises, Indio, and others are being worked in good shape. The hoisting works from the Penelope will, it is said, soon be moved to the San David, which is one of the most promising of the Princesa Company's mines. Outside of the Princesa Company, the most important work is being done by the Aurora Company. Hoisting works are being put up and the new pump put in place, and the mill is receiving some additions and repairs. The shaft in the Aurora mine is steadily sinking, and the proprietors intend to keep on until they have a sufficient ore body assured above their heads to warrant a big mill, which will then be forthcoming. Matias Moreno and Julian Rodriguez followed up a ledge of gold ore which they found near Moreno's house in the Guadalupe valley, and were surprised and delighted to come upon an old shaft that had been abandoned, containing ore showing free gold in abundance. The ledge at the old shaft is about four feet wide and offers rich returns to the finders, who have denounced it and will commence work upon it.

MONTANA.

A GOOD YEAR. — *Inter-Mountain*, Dec. 18: Butte's production this year will be above $25,000,000, and the promise is fairly sure that in 1891 it will go a good deal above $30,000,000. Butte is the greatest mining camp on earth, and it will be several times greater before the next ten years.

SYNDICATE MINES RESUME.—A source of much satisfaction to many is to learn of the resumption of the Syndicate mines. The Mountain and the other three now employ about 1200 men in and around the properties that have for about two weeks been in a state of idleness.

THE BOSTON AND MONTANA.—There has been no reduction in the output at the Boston and Mon-

tana smelter the past week. The mines are in the same condition of affairs, and in all their underground workings they present the best showings of any mine or mines in the district.

THE ANACONDA MINE is employing about 400 miners underground, a force equal to that of eighteen months ago, and the production of ore is, if anything, greater than it was at that time.

THE ST. LAWRENCE is not employing as many men by 200 as the Anaconda, though a vast amount of work is being performed and a full share of ore comes from this mine.

MOUNTAIN VIEW COPPER.—There is no better showing in any copper mine on earth than that on the 1000 of the Mountain View.

NEW MEXICO.

GRANT COUNTY.—*Enterprise*, Dec. 17: Five more stamps are being added to the Key mill and will soon be dropping on ore. The main workings of the Key have now reached a depth of 600 feet, and the mine is in better shape to produce heavily than ever before. Favorable reports continue to come in from Cook's Peak district. It is to-day the heaviest producer in Grant county, and the greater the development the larger the ore bodies.

THE YEAR'S PRODUCT.—*Sentinel*, Dec. 16: In the output of gold, silver, copper and lead, Grant county leads all others in New Mexico. The total of all metals produced reaches the handsome figures of $1,426,903. She is followed by Sierra with $976,686; Santa Fe, $727,654; Socorro, $366,626; Lincoln, $218,459; Dona Ana, $158,356; Colfax, $117,500; Mora, $23,200; Bernalillo, $8500; a total of $4,023,883 for the year.

MINE DEVELOPMENT.—Silver City *Enterprise*, Dec. 19: Mining transactions of importance are becoming an every-day business in the Mogollons. Among the latest reported are the transfer of one-third interest in the Little Fanny mine to the Mogollon Consolidated Mining Company, Captain Frank Vingo receiving therefor one-third interest in the Mogollon Consolidated Mining Company's mill and $10,000 cash. The mill is one of the best constructed reduction plants in the Territory, and cost upward of $70,000 to build. With such a mine as the Little Fanny to produce the ore, the company ought to be on a good dividend-paying basis, and Captain Vingo is in a fair way to become a bonanza king. Another transfer during the past week was the bonding of the Mountain Key claim on the Queen lode, owned by Mader & Buhlman. The mine is bonded to New York parties for the sum of $30,000, a large portion of which was paid cash down. This is another instance of miners abandoning claims without thoroughly prospecting them. This claim was first located by Jno. A. Miller in '79 or '80, and abandoned in '83. It was then relocated by Jo E. Sheridan, who held it for two years, and abandoned it in '85 or '86; relocated by Wm. Burns, one of the pioneers of the camp and a thorough mining man, but he also failed to discover its value, and abandoned it, when it was relocated by Geo. Rowe and others, and again abandoned, when Mader & Buhlman relocated it and discovered several rich ore chutes covering nearly one-half of the whole 1500 feet, and placing it in the front rank as a producer. The New York parties who have now taken hold of it propose to develop it thoroughly and erect reduction works at the mine.

OREGON.

BLUE GRAVEL.—Asbland *Tidings*, Dec. 19: Wm. Huntley Hampton, the Portland assayer and mineralogist, was in town several days last week on his return home from a visit of several days in the Blue Gravel country over about Hornbrook. He has unbounded faith in the eventual development of a great mining industry in drifting and working the great beds of blue gravel which have been proven to exist and to carry gold. How rich the gravel is the future will have to determine, but it is said that none of the people who are working in it have reached a point where it is to be expected the rich part of the ancient water-bed lies. The bedrock is pitching wherever exposed under the gravel, and the distance from the shore-line is not far enough in any place yet worked to lead the miners to expect the returns that are looked for at the line of gold deposit from sources that have fed the gravel deposits; at least that is the case at all the mines yet opened unless it be at the one on Greenborn, near Yreka, where the miners are drifting 80 feet beneath the surface and are reported to be taking out $25 per day to the man. Mr. Hampton represents parties who have located some 300 acres or more of the land supposed to overlie the gravel, and while over there last week he let the contract for the sinking of 50 feet of vertical shaft over one of the claims. This 50 feet is not expected to reach the gravel, and is but the beginning of a shaft which may be 200 feet before the gravel-bed is struck, Mr. Hampton says.

SOUTH DAKOTA.

HOMESTAKE CO.—Deadwood *Pioneer*, Dec. 18: A rumor has been going the rounds ever since the Caledonia shut down, that the mine had been sold to the Homestake Company and would be worked by them. Yesterday this rumor was authenticated by one in a position to know. He says that the recent purchase of the Pierce mine by Tom Bell, who is a director of the Homestake Company, was in the interest of that company, and that the two mines will form a portion of the great Homestake system.

UTAH.

VARIOUS MINING ITEMS.—*Tribune*, Dec. 18: Deep creek is still the absorbing talk with mining men throughout the Territory. A company has been organized in Salt Lake to work the gold placers in Mill Creek canyon. Hydraulics will be used. An extensive deposit of ozocerite, or mineral wax, has recently been discovered in Hurricane Valley, about 25 miles south of Rio Virgin, in Southern Utah. The Ogden *Standard* claims that there are a number of rich lodes of silver lead ore in the Wasatch range, near that city. There are said to be 100 men in Tintic awaiting Jan. 1, 1891, with a great deal of eagerness and anxiety, that being the day fixed on which they expect to make a gun play and rob some poor prospector of his mining claim. Henry Ressor, a reputable miner from Marysvale, came into Beaver yesterday and reported that a wonderful gold mine had just been discovered at the head of Bullion canyon. About six feet of croppings has been removed, all of which contains gold sprinkled through it in size and shape of a pea. A sample of the rock was taken to Tom Ferguson's assayer, which assayed $60,000 to the ton. The vein has every appearance of permanency.

NIAGARA ORE PRODUCT.—The Niagara Co. has two four-horse teams hauling 30 tons of ore per day from the Live Pine mine to the railway depot, and the mine is in shape to keep this up for a long time. The Stewart No. 2 has its mill running on gold ore, and they propose to keep the ten stamps, two pans and one settler going right along. They also have a barrel or Frieberg amalgamator running. The mine is looking spendid. One of the evidences of the growth of mining in Bingham is found in the fact that since last June 160 new locations have been recorded. Dividend No. 7, of $15,000, for December, has been declared by the Centennial-Eureka. A rich strike in the Golden Chain, close to Mammoth, is reported. J. C. Carson has a lease and bond on the ground and will, no doubt, now that he has struck it rich, take up the bond, which is for $30,000.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 25, 1890.

The close of this year is no exception to its predecessors—dullness reigns supreme in all lines. The local money market is shaping itself for general ease. Taxes are paid and the last collection day of the year falls on next Monday, which will be followed the ensuing Monday by disbursements for interest, dividends and payments by the State, counties and cities. These disbursements will extend well into the month. There is a growing feeling of confidence. Long-term loans are more readily obtained, while gilt-edged paper is being sought for by some moneyed men. Eastern advices are confirmatory of returning ease and a gradual shading off in the rate of interest.

MEXICAN DOLLARS—There is a slight demand at 82@83 cts. The next steamer for China sails on January 10th.

SILVER—In the absence of Mint buying, quotations are nominal. The Mint will be in the market on January 2d. Eastern advices are conflicting, but from a careful study of the field we are drawn to the opinion that no free-coinage bill will be passed by this Congress. Partisan legislation, not the country's good, appears to be the aim of the dominant party, and in carrying out their pet political measures, financial and other business legislation will be held in the background. Again the moneyed men, unscrupulous speculators and Shylocks, who skin the many forced to seek accommodations, are opposed to the free-coinage of silver. They recognize the fact that when the latter is secured they cannot carry on their games with the same high hand they have done for years past. To defeat silver legislation, they would undoubtedly spend considerable money to influence Congress. Jay Gould lately sounded the key-note for them. A pool is said to be buying all the silver bullion it can get, in the expectation of selling out at a good profit on the cry of a free-coinage bill being passed by this Congress.

QUICKSILVER—Receipts the past week aggregate 162 flasks and 550 flasks by overland railroad. The market is quiet, rendering quotations nominal.

LIME—Receipts the past week aggregate 4286 bbls, and exports by sea 1350 bbls to Honolulu. The market is quiet, but not dull as it was in December, 1889.

BORAX—Receipts the past week aggregate 220 ctls. The market is quiet. Some buyers claim that commissions are obtainable, but the companies report unchanged quotations.

ANTIMONY—The market is a shade lower. Exports by sea the past week aggregate 11,000 lbs. to New York.

LEAD—The market, after easing off for some time, appears to have touched bottom. At the East a better demand is expected to set in soon after the holidays. European advices report an improving market.

TIN—Imports the past weak aggregate 1770 pigs from Sydney and 5720 boxes of plate from Liverpool. Pig is lower and weak at the decline. Plate continues firm. Eastern advices report an advance for pig for January-February delivery, due to light shipments into England from the Straits, causing an advance in the English markets. London cables report a light demand for plate, but more strength for pig.

COPPER—The market continues on the down grade. London cables to the *Iron Age* under date of Dec. 18th, report as follows: Prices for copper dropped early in the week, owing to pressure to sell by holders and manipulation by the bear interest arising from the unfavorable condition of other markets, and rumors that larger supplies are likely to come from America at probably lower prices. Consumers are still cautious buyers, but speculation has improved somewhat the past few days. English stock of copper has decreased 1410 tons, and the European visible supply 1609 tons during the past fortnight.

IRON—Imports the past week aggregate 450 tons from England. The market is barely steady. Slight concessions are said to be obtainable.

COKE—Imports the past week aggregate 395 tons. The market is steady.

COAL—Imports the past week aggregate as follows: Swansea, 2249 tons; Seattle, 3250; Coos Bay, 600; Liverpool, 2379; Tacoma, 2400; Hull, 1367; Nanaimo, 3319; total, 15,564 tons. The market is easing off for Coast coals, which will be followed next month by foreign coals. Importations of English are coming to hand more freely, while Australian will begin to arrive toward the last of January. Coal vessels on berth at Australian ports are receiving quick dispatch, while the list of vessels loading and to load, steadily increases. At the present writing, everything points to an unusually large wheat crop in this State, which means good outward freights, and to get advantage of it, coal vessels will head this way. The acreage seeded to wheat is the largest up to the last of December, on record.

Mining Share Market.

Mining shares the past week were more active, with attractive fluctuations, particularly in Potosi and Bullion. The moves in these two stocks indicate they are well in band and that the stock-gambling pool is trying to draw in buyers in order to collect the assessment on Potosi and levy one one Bullion at the annual meeting to be held next month, to be followed by assessments by other companies. So far as we are able to learn, large outside dealers are afraid to buy, preferring to sell short on every little spurt.

While the writer has no confidence that the stock-gambling pool will send prices up very high, yet it is safe to affirm that with money easier next month (on and after the 10th), a more vigorous effort will be made to unload at a profit. In order to sell, the moves will probably be attractive, and even a showing of ore may be resorted to. That rich ore, but not to any extent, can be shown up at any time is not denied by the well informed; but to the ring it pays better to mill the ore, peculiar to the Comstock district, by reducing assays and bringing the cost up to cover the value of the bullion turned out. This assertion is based on a qualification, provided the pool has no surplus stock to market at a profit, but if it has more shares than desirable, then some one of the mines is made to do service by paying dividends until the stock is unloaded. Con. Virginia paid dividends until the stock of that and adjoining mine was peddled out. Confidence was made to do service in like manner. After peddling out stocks, nothing has been left undone to get them back at low prices. In this they have been successful, and it is only a question of a short time—one or more months, perhaps less—when a decided up move must be made to again sell out at a good profit. What the manipulation will be in the meantime, we cannot say, but persons who have stock *paid for* can and should stand a decline, well knowing that higher prices will come, enabling them to sell out at a profit. In operating in stocks, the most successful in the long run are those who pay cash (no margin), buy after a severe depression, and hold until the market advances to afford a good profit. It is those who want everything that get left.

The decline in the Comstock shares the past six months averages about 70 per cent, including paid assessments on some.

The points are out for another decline in the Comstocks, after which the stock-gambling pool will start the deal. Many usually well-informed persons are waiting for the lower prices. Stocks selling below $2.50, $1.50 and $1 a share will not go down much, but the higher priced will fall off the most.

J. H. Tingman, vice-president of the Mining Stock Association, has a very savage article in the New York *Engineering and Mining Journal* of Dec. 13th, which that paper indorses. If Mr. Tingman's assertions are wrong, why do not the officials of the Comstock mines prosecute him for criminal libel? This is the best way to clear themselves of such criminal charges.

Eastern Metal Markets.

By Telegraph

NEW YORK, December 24.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday	49⅛	1 07¼	$15 00	4 12½	$20 30
Friday	49⅛	1 06	15 00	4 12½	20 80
Saturday	49⅝	1 04	15 00	4 12½	20 80
Monday	47½	1 02⅝	15 00	4 12½	20 50
Tuesday	47½	1 01½	14 75	4 12½	20 50
Wednesday	....	....	....	....	....

Borax is barely steady. Lead has a firmer tone. Tin appears to be gaining in strength. Copper is weak and feverish under selling pressure. Arizona is 14, common casting brands 13.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

NEW DISCOVERIES.—There cannot be a more indefinite speculation than that as to the era in which the mineral resources of the world will be exhausted, for discoveries of "enormous deposite" of mineral are of almost every-day occurrence, each one apparently outvying the other in importance. Not only have discoveries of gold been made in Canada that are said to be likely to have more brilliant results than even those of Mexico and California, but silver and lead have been found in great abundance in Russia. These deposits exist at the source of the River Konhanc, and the prospecting which has taken place since March shows that the mineral is of considerable richness. More than twenty veins of silver and lead have been discovered, some of them bearing evidence of having been worked centuries ago. These deposits are favorably situated for their exploitation, for not only is there an abundant and rapid current of water in the River Konbsnc, but the railway is in close proximity, and the roads for that part of the empire are good. These discoveries of mineral deposits in Russia are evidently the outcome of the steps that are being taken to develop the resources of the country.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

MECHANICAL PROGRESS

Possibilities of Aluminium.

At the late meetings of the American Institute of Mining Engineers held in New York, one of the chief matters under consideration was the production and possibilities of aluminium, that wonderful metal which promises in the near future to be of vast importance to civilization and the human race everywhere.

At this meeting, and from college professors and mere experimentalists, there were present men whose great interest in metal is to make it of use to them in their business pursuits. Alfred E. Hunt, President of the Pittsburg Commercial Company, which through a new electrical process has greatly reduced the cost of producing the metal, and is prepared to supply it in large quantities, read a paper on "The Properties of Commercially Pure Aluminium." Professor Eggleston of Columbia College gave the result of some experiments he had made, and Professor William P. Blake and several other scientists made statements as to the properties and uses of the metal.

Stripping the subject of technicalities, it appears, according to a report of the meeting which we find in the N. Y. *Standard*, that aluminium, which is as strong as iron, and the best of it is as strong as steel, is only one-third as heavy as iron. It has a bright silver color, and is susceptible of a high polish. It is noncorrodible, is both malleable and ductile to a high degree, and is almost as good a conductor of electricity as copper. It readily unites with other metals, and as an alloy reduces the melting point of steel, a very important thing, and it frees both iron and steel castings from the bubbles or "blows." Silver and copper it hardens. Aluminium's chief use just now is in being mixed with bronze, producing what is known as aluminium-bronze, used in the highest grades of the arts. Among the exhibits of the metal before the institute were rolls of ribbon-like foil, some of it so thin that it could be blown away with a breath. Then there were all sorts of ingots and castings; cups and boxes drawn out of flat pieces; tubs, coils, medallions, pots, saucepans and frying-pans. With regard to the latter, Professor Eggleston said that while recently making an investigation for the New York Board of Health, he had made some experiments with the aluminum cooking utensils, and found that they were not attacked by organic acids, thus making impossible that slow but deadly process of lead or other metal poisoning known under that vague and general name of "malaria." As vinegar is an organic acid, the danger of using ordinary metal utensils is obvious.

Though present in all clay deposits, the difficulty of extracting it has hitherto made aluminium a commercially dear metal. It is not such a long time ago since its price exceeded that of silver, which is $12 a pound. Discovery after discovery simplifying the process of production has steadily brought the price down, until now aluminium is sold for about the same as nickel. There are perhaps a thousand men busy in their laboratories in various parts of the world seeking for some process by which to make the metal cheap and abundant. When they shall have found it, who can calculate the change there will be in the construction of railroads and steamships, the building of houses and bridges, and the making of thousands of things where iron and steel are now used? Take the bicycle for instance. An average "safety" machine weighs between fifty and fifty-five pounds, and the very lightest machine thirty pounds. Imagine machines of the same strength that shall weigh but eighteen and ten pounds respectively! But more important than all these, aluminium seems to have brought aerial navigation a long stride nearer, and who shall say how soon in this aluminium-electrical-single-tax age we shall be sailing the air in ships?

The very latest report of the progress made in cheapening the production of aluminium was given in a telegram of December 16th from New York, which said that a member of the bar in Columbia, S. C., has discovered a process by which aluminium can be produced from kaolin at a cost far below anything heretofore announced. While this statement must be received *cum grano salis*, there can be no doubt but that the progress of cheapening this product will continue to go on until it can be placed in fair competition with any other of the useful metals, especially when its lightness and other superior qualities are taken into account. It is more than likely that aluminium is in reality the coming metal.

Wear of Metal, as Influenced by Its Chemical and Physical Properties.

1. That metal which will suffer the most distortion without rupture will wear best. This quality of metal is usually measured or expressed in figures by the well-known physical data "elongation" or stretch before rupture in the common physical test.

2. The first variable being obtained in satisfactory amount, an increase in tensile strength will add to the wearing-power of the metal. The diminution of tensile strength, which is characterized by the better wearing of metals, according to our data, is not, if we are correct, a desirable quality. It is a concomitant of most metal that as it increases in its power of elongation, or stretch, before rupture, it diminishes in tensile strength. If, on the other hand, a new metal could be found, which, with any given elongation, was characterized by a higher tensile strength than some old and well-known metal with the same elongation, the new metal would, if the theory is correct, wear better than the old one. Wear, as we understand it, is the tearing off of minute particles, and if in one case it requires more force to tear off the particles than in another, the wear in that case will be slower. We have, we think, a little experimental data which point in this direction. The wear of bearings per thousand miles is about three times as fast as the wear of axles; in other words, as has already been stated, the standard phosphor-bronze bearing metal loses about a pound for each 25,000 miles that the bearing moves. The axle under it loses about a pound for each 75,000 miles, but the metal of the axle is from two to three times as strong per square inch, and its elongation is also somewhat higher than the bearing metal alloy.

3. The third variable which enters into wear, as we look at it, is what may perhaps be termed the "granular structure of the metal." This may, perhaps, best be illustrated by saying that, of two metals which have the same tensile strength and the same elongation, the one which is finer in granular structure will wear the slower.—*C. H. Dudley.*

Mountains of Steel.

Nearly four and a half million tons of crude steel were turned out in the United States during the year ending June 30, 1890. The amount produced during the census year of 1880 was a little short of one and one-quarter millions—showing an increase from 1880 to 1890 of 289 per cent. The principal increase was in Bessemer steel—from 985,208 tons in 1880 to 3,788,572 tons in 1890. The product of open-hearth steel was advanced during the same decade from 84,302 tons to 504,351 tons. In 1880 there were but 11 Bessemer steel plants in the United States, while now there are 53.

Steel Rails Not the Chief Cause of this Great Increase.

One of the most interesting things in connection with the large increase in the steel industry is the fact that the steel-rail industry is not increasing. The increase in the number of establishments producing Bessemer steel, according to the census report, has been the result almost entirely of the demand for steel in forms other than rails. All the 11 Bessemer steel plants that were completed in 1880 had been built to manufacture steel for rails, many of them being added to previously existing iron-rail mills. Of the 53 Bessemer steel plants at the close of the census year 1890, only 14 made steel rails during that year, and of the total quantity of rails produced, over 90 per cent was made by ten of these works. Thus, while the production of steel rails has nearly trebled in amounts since 1880, the number of establishments engaged in their manufacture has shown but little change in the ten years, although many of these works have greatly increased in size and efficiency. The competition in the manufacture of Bessemer steel rails has compelled many of the rail-mills to convert a large part of the steel produced by them into forms other than rails, the production of rails to any considerable extent at the present time being possible only in works favorably located for the supply of cheap raw materials and operated under the latest and most improved methods of manufacture.

Open Hearth and Crucible Steel.

The number of plants for the manufacture of open-hearth steel has increased from 25 in 1883 to 58 in 1890, and the production has increased during the same period from 84,302 tons to 504,351 tons. The number of crucible steel plants has increased from 36 to 47 during the decade. Pennsylvania made 64,235 tons of the total for 1890, and New Jersey stands next with 8343 tons.

IRON AND BRICK CHIMNEYS.—According to Prof. H. B. Gale, there is but little difference in the matter of draught between an iron and a brick chimney. There is more radiation from the iron stack, but this is offset by the greater frictional resistance and liability to leak in the brick stack. It is also found, as appears from those investigations, that the amount of difference between the draught from a round and a square chimney of the same light and sectional area is only 2 per cent. It is really much cheaper to build a square chimney.

SKILLFUL IRON ROLLING.—The Otis Steel Co. of Cleveland, Ohio, which has the largest plate mill in the world, recently rolled a 20-inch ingot of 8500 pounds down to three-quarter inch plate with one heat. Some of the members of the British Iron and Steel Institute, who visited these works during their tour of inspection in this country, were surprised at seeing plates rolled direct from the ingots without being hammered or otherwise prepared.

THE ELECTRIC DRILL.—The use of the electric drill in shipyards and construction works is becoming quite common, and it is shown that holes can be drilled in half an hour by the use of the electric drill that would require two men half a day to finish by the usual process.

SCIENTIFIC PROGRESS.

Experiments on Fire-Damp Mixtures.

A commission on colliery explosions, appointed by the French Board of Trade, has published a report on a series of experiments made by Messrs. Mallard, Le Chatelier and Chesneau, mining inspectors and engineers, upon the effect of sparks produced by miners' picks striking hard rocks upon mixtures of air and fire-damp. For this purpose were used mixtures of pure formene and air, and of these mixed with ordinary illuminating gas, which were made by passing the gases through multiple Bunsen burners into a wooden box, placed against granite and porphyry blocks, so disposed that by striking them with a pick the sparks fell into the box. Mixtures of illuminating gas and air were easily exploded by the sparks whenever they were large enough to remain incandescent during an appreciable time, a result obtained with nearly every blow. The sparks are formed of metallic particles burning strongly and forming globules of magnetic oxide. With mixtures of formene and air no inflammation could be obtained, although more than a hundred experiments were made under conditions in which a mixture of illuminating gas and air would certainly have been ignited. This difference is probably due to the inflammation of formene requiring a much longer time than that of illuminating gas, and the sparks becoming cold before it can be effected. Further experiments were made with mixtures of formene, illuminating gas and air; when the mixture contained equal quantities of two gases, explosions were sometimes obtained, but with mixtures containing .75 per cent of formene and 25 of illuminating gas, no explosions took place. As the best analyses of natural fire-damp show it to be composed of pure formene with only 3 to 4 per cent of other gases, the commission concludes that ignition of fire-damp in collieries cannot be produced by sparks from miners' picks. The picks used were both steel and more or less steely iron; but besides these, picks of steel, containing 13 per cent manganese and aluminum bronze, with eight per cent aluminum and 2 per cent silicum, were tested. The former give off hotter and larger sparks than iron picks, and ignite explosible mixtures still more easily, while on the other hand the aluminum bronze picks, whose hardness nearly equals iron, do not produce sparks and could not be made to ignite any of the mixtures. This is rather important, as, although the ordinary fire-damp may consist chiefly of formene, there is no certainty that no other gases may be inclosed in the coal and set free at times; and if bronze picks are absolutely safe they should, by preference, be used. By suitably mixing the alloy or treating it in forging, no doubt sufficient hardness for coal-mining purposes could be produced.—*Iron and Coal Trades Review.*

Reckoning Time.

A correspondent of the New York *Evening Telegram* tells its readers how the time is reckoned at the observatory in Washington, as follows:

The observatory does not reckon its time by the sun, but by the so-called "fixed" stars, which are so far off that their position with relation to the earth does not change appreciably within a few months or years. Star time is the only true time, therefore. The operator looks through a big telescope and watches for a given star that he knows to cross the plane of the meridian. As it crosses he records what moment it does so, as shown by a star time clock with a 24-hour dial. Then he consults a printed table that shows him at just what number of hours, minutes and seconds the star in question must actually have crossed the meridian plane.

The table is right, and by as much as the star-time clock differs from it, the latter is wrong. No attempt is made to set the star clock right, allowance being simply made in subsequent calculations for the error thus discovered, which amounts only to a fraction of a second in some days. Next the corrected time, as taken from the star clock, is reduced to sun time, which requires some figuring, inasmuch as the star year is one day longer than the sun year. A sun time or "standard" time clock stands close by, and the amount that this varies from the truth having been ascertained, allowance is made for the error in sending the noon stroke all over the country.

Regulating Chronometers.

At the observatory all the chronometers made for the navy are tested and regulated before they are sent out on vessels, each of which is supplied with three first-class chronometers, as well as one that is half used up, called a "hack," for carrying about and for rough service generally. It takes 21 weeks of testing to properly regulate and prove a chronometer, and part of the trial consists in subjecting the instrument to the action of cold in an ice-box, and to heat communicated through steam pipes. Each chronometer, when given out, is accompanied by a chart telling just how it will vary under certain temperatures.

ELECTRICAL SCIENCE. — The *Chautauquan* says: The attention of the electrical world has been centered upon electrical business more than electrical research. The progress made has been chiefly in the construction of reasonable or "working" theories to explain the phenomena of electricity. Among these is the theory of electrical transmission along a wire. We must now think of an electric wire as the core or center of disturbances extending all around the outside of the wire. We must not regard electricity as a "current" in the wire. It seems to be of no consequence what is going on in the wire, as all the energy is displayed on the outside, and the wire is probably affected only "skin deep."

Iron-Making in its Picturesque Aspect.

"It is strange," says the *Academy*, "that the rich material that lies ready to the eyes and hands of artists in our great modern iron works has not been more often seized upon for the making of pictures. Every one who has seen the processes of smelting and forging iron cannot fail to have been struck with the many picturesque effects that they yield—effects such as Rembrandt delighted in—of glowing light in surrounding darkness, of mystic beams and strange shadows casting a spell of beauty upon the most commonplace objects. A painting by our rarely seen native painter Wright of Derby was exhibited two or three years ago at the Old Masters' Exhibition at the Royal Academy, which represented the forging of a piece of iron with considerable skill and very fine effect; but, excepting this, we do not remember to have seen any work by an English artist dealing with this subject.

"A German artist, however, has recently recognized its capabilities. In a great picture, called the 'Cyclop's Workshop,' Adolf Menzel has represented the interior of a large iron foundry, with its giant steam-hammer, its blast and puddling furnaces, and its huge cylinders that roll out glowing masses of iron of many hundred-weight as if they were soft paste. One of these glowing masses forms the center around which the interest of Menzel's picture moves. It has passed through the first rollers, and is being taken up with great tongs by the foremost workmen in order to be passed on to the second, a proceeding that involves a prodigious exertion of strength. Other workmen are employed in different processes; some direct the machinery; one in the foreground wheels away a newly forged cylinder on a barrow; others are undergoing a very necessary process of purification and shirt-changing; while others again are seen in a group in the dark background, already beginning their mid-day meal. In the background of all is dimly visible the iron and steam monster that supplies the motive force for all this wonderful work.

"It will be acknowledged that here are splendid materials for a picture, only it wants a Rembrandt at least to deal with them. Herr Menzel is not a Rembrandt, but, according to the Berlin *Post*, from which this description of his picture is taken, he has produced a powerful, realistic work. He has worked for three years, it is said, on this one picture."

These comments will recall to American readers Mr. Wier's picture of "Forging the Shaft," which made its mark at the academy several years ago.

THE TRANS-SAHARAN RAILWAY, from Algiers to Timbuctoo, is said to present no insurmountable engineering problems; in fact, to be less difficult than the construction of our own transcontinental lines. The real difficulty will lie in dealing with the wild tribes of the desert, who control all the routes from Algiers to the Soudan; who are nomads whose only source of revenue is the tribute paid by caravans. The French propose to give them employment; promote village life by sinking wells, etc. But they are so wild that it is difficult to even negotiate with them. With a railway to the Soudan, where commerce is most valuable, it would be possible to reach Timbuctoo in six days from Algiers; or say a little more than a week to pass from Marseilles to the heart of the Dark Continent.

OF INTEREST TO OIL CONSUMERS.—The greatest difficulty encountered in the refinement of oil consists in the trouble experienced in combining in the same brand high gravity, high fire test and free burning qualities. It is universally conceded that the best quality of crude oil which has yet been discovered is found in Washington county, Pa., and the finest well of that locality supplies an oil from which has been produced a superior brand named the "Extra Star" kerosene. This oil is made by only one refinery in the United States. It is perfectly water white, and is said to be the only oil that will stand the "polariscope" test.

A HOUSE FLY is born fully grown and of mature size, and there are no little flies of the same species, the small ones occasionally observed being different in kind from the large ones. The house fly does not bite nor pierce the skin, but gathers its food by a comb or rake, or brush-like tongue, with which it is able to scrape the varnish from covers of books, and it thus tickles the skin of persons upon which it alights to feed upon the perspiration. The fly is a scavenger, and is a vehicle in which contagious diseases are spread. It poisons wounds, and may carry deadly virus from decaying organic matter into food.

ELECTRIC LIGHTING, says M. Fontaine, did not make its appearance until the close of the year 1873. It was in Paris, in November, 1873, in the workshop of M. Gramme, that the first installation on a really industrial scale of electric lighting took place.

ELECTRICITY.

By Balloon to the North Pole.

Two members of the Paris college of aerial navigation—M. Besancon, aeronaut, and M. Hermite, astronomer — propose seriously to reach the north pole hy mesns of a balloon aad havs explained to tbeir colleagues the meane hy which tbey hope to succeed in their object. The balloon in which they are to travsl will be made of twn thicknesses of Chinese silk, oovered with an impenetrable varaish, will bold about 45,000 cabic feet of pure bydrogen gas and carry a weight of over 8000 pounds. Thay will also take with them four small pilot balloons, which will he sent up from the north pole—should they ever reaob that mucb-longad-for spot—to test the air currents prevailing there, aad four buge bags of hydrogen gas to replenish the large balloon shonld wasta occur.

Tbe car in which ths aeronauts will bava to live is to he coated with thin steel, and will contain, in addition to its human occapants and their scientific instruments, eight dogs and a sleigh, a small, nnsinksble canoe, and provisions for a month. In order that tbe balloon may be kept at a ragular distance from the earth it will be furnished with a heavy rope and an anchor to drag along tho surface either of ice or water.

The intention is to eqaip two vessels at a Frenob port and sail to Spitzhargen. Tberc the hydrogon gae will be manufactnrad and the great halloon and its satellites inflatad, the aeronants starting on their voyage of discovery with the first favorable wind. They expect to ha about ten daye in tha air, aod to he ahle to take pbotographa and scientific observations. Where tbey will descend thay heve no idea, hut if all goes well thay bope to reach some civillzed point either in North America or western Asia.

The duration of tbe expedition from Frsnoe and hack is estimated at six months, and tbe oost is pnt down at naarly £23,000, tha larger part of whicb goes for the hire and equipment of the two vessels at Spitzbergan. This will be mainly defrayed by tbe aeronauts themselves, assisted by subsidies thay bopa to receive from hoth English and French scientifio sociatles.

Tbe start will not ha made until May, 1892, the interval being devoted to expariments to ascertain bow long it is possibla to remain in a halloon without descending. The project is attracting mnch attention in scientific circles in Paris.—*St. James Gazette.*

Definition of the Term Volt.

A definition of a "volt," wbich, although somewbet unscientific, may prove suggestive to lay readers, is given in the Chicago *Evening Post* in the following terms: "The volt gives one blow of a specified force. As volts are added tegether, the force of the blow is increased until the endnrance limit is resched. It takes about 25 volts to make a perceptible tingling sensation. Wben 50 volts pass throogh the body the tingling sensation becomes unmistakahle, bnt not strong, while 100 volts feels lively, 200 volts strong, 300 volts powerful, 400 volts, Titanic, and 500 volts will knock a man flat." In tbis connection tbe followiag in regard to

The Definitinn of Ohm

May be of interest. The Boston *Journal of Commerce* says: One is reminded very often that the electric bnsiness is still in its infanoy, and lately by the determination of a new definition of the electrical unit, the ohm. It is now rocommended tbat the ohm be defined by the resistance of a mercury column of one sqnare millimetre section, 106 3 centimeters long, 0° C. The British Association makes tbe definition wbich will probably be adopted by the different governments. In the history of the steam engine it waa a long time before units beceme settled, and not till 1849 that Joule announced the results af his experiments on tbe mechanical equivalent of heat, giving the standard of to-day. In early days pressure was designated by inches of mercury instead of pounds, and many experiments were made to determine the force of steam of different temperatures, in inches of mercury. Steam gauges at that time were mercury gauges, and the pressure designated hy the hight a column of mercnry was raised by the pressure of steam. These also served another purpose of acting as a safety-valve, the excess of pressure blowing the mercury out of the tube into a vessel, and providing an escape for the steam.

ELECTRIC WELDING is getting into a shape where it is practicable. Steam pipes can now he placed end to end and heated to such an extent where they come together that there is nothing to hinder getting a perfect weld, so much so that they can be rolled up into a continuous spiral coil without any regard to the joints, a process that is found to he of great use in the manufacture of ice-making machines. If steam pipes can he united in this manner so perfectly, there is no doubt that cross pipes can he attached as well, and a tubular boiler constructed on the most improved plan, that will he cheap and simple, with no chance to explode, with all the heating surface and steam room that could be asked for.

ELECTRIC ELEVATED RAILWAYS.—The action of the city of Boston in essaying to effect on an elevated railway the same snccessful and profitable developments of electrical traction which it has accomplished on its surface lines, is regarded with much interest by electricians all over the country. One of the greatest objections to elevated railways has always been the use of steam locomotives, with their disagreeable accompaniments of noise and smoke and cinders. With the heavy locomotives, too, required for steam traction, a very cumbrous structure was needed, hut with the use of electricity, cars lighter and of more ornamental construction can be adopted. This new departure of Boston seems likely to inaugarate in city travel an era long desired. It is now mentioned as a fact that a mile an hour hetter time is made in Boston hy the surface electric cars than in New York hy the steam cars of the elevated roads.

USEFUL INFORMATION.

A Singular Fad.

According to a Rochester paper, the "iron man," so well known to the fireman of western New York, is now a member of the Protectives of that city. For the benefit of the ignorant it may be stated that the iron man is an iron figure of a fireman standing nearly three feet high, and belongs to whatever fire company can *steal* him. To whom tha iron man originally heloaged is not known, hut in the last ten years ha bas graosed tha fire-houses of varicus New York aad Csnadian fire companies. Tbe possession of the man is a scuroe of great pride to a company. He is naver given away. He must be *stolen*, and the theft is nevar questioned hy tbe company losing tha mucb-desired trophy. Several years sgo tha iron man was stationed on the engine-house at Niagara Falls, but on the occasion of a tournament there he was stolan hy a St. Catharines ocmpany and taken to Csnada. There he ramained for some time, hut be was not safe from covetous fireman, snd during a convention in St. Catbarines ba was captnred by the Hydrant Hose of Lockport and carried to the latter city, whera he was fastened in front of tha aompany's bouse. For greater safety tbe man was attached to a solid steel rod, tha latter running back into tha bose-house and being fastened close to one of the "bunkers'" quarters.

The iron man had not been long in tha City of Looks before the Warner Chemicsla of Albion cast longing ayes upon him, and one night about four years sgo thay made a quiet visit to tbe Hydrent's headquarters, and after several hours of herd labor filed the steel rod and carried off the man without awakening the "bunkers." Tbe Albion boys hired a steeple-olimber from Rochester to go to that village and put tbe trophy upon tbe very top of the tall hose tower. Here, away up above the busy world, it was the popular belief in Albion, the iron man wonld spend the rest of his days. And for four years be had remained. But when tbe Rochester Protectives went up to Albion recently to take part in tbe annual parade, tbey decided that they wanted that man, and shortly after midnight D. K. Carter scsled the wall of the tower, and at the risk of his life brought tbe iron man cnce more to earth. So fearful was the captor thst the prize wonld he wrested from him that he hired a hack and drove to Rochester with the trophy. On the top of the Rochester Protectives' house is a niche, and here the iron man is placed. The members of the company feel confident tbat there he will he sefe, hut it is likely that not yet has the iron man completed his travele.

WHAT THE WORLD OWES TO CRANKS.—It was to tbe courage and perseverance of a crank that we owe tbe discovery of this great hemisphere. It was a crank that gave us the printing prese, tbe cotton loom, the locomotive, the telegraph. All the great inventors, from Archimedes to Edison, have heen cranks; all the great philosophers, from Plato to Herbert Spencer; all the reformers, from Lycurgus to Lady Hahhertoo; all the great preachers, from Peter the Hermit to Henry Ward Beecher; all the heroes who left their plows standing in the furrow while they went to fight for liberty under Washington.—*Kate Field.*

A CURIOUS FACT in statistics of population is the greater number of people whose age is expressed in decimals of ten. For instance, in the last oensus of Rhode Island there were more than twice as maay people 50 years old as there were 49. So, again, it wes shown that there were in a certain county 2000 colored people 69 years old, 1200 seventy-one, and 19,000 seventy. The fact is a striking illustration of the general fondness of people for round numbers. A man who is 59 or 61 years of age is quite apt to call bimself 60, and in a similar case a woman will call herself 40 or 50.

HOW TO REMOVE OIL-MARKS ON WALLS.—Oil marks on wall paper, where careless people have rested their heads, may be removed hy making a paste of cold water and pipeclay or fuller's earth and laying it on the stains without rubhing it in; leave it on all night, and in the morning it oan be brnshed off, and the spot, unless it he a very old one, will have disappeared. If old, renew the application.

A FIRE was caused in a singular way the other day in Highland Park, opposite New Brunswick, N. J. The handsome country residence of Peter Zimmerman was discovered to he on fire. Tbe flames were first seen in a bay window at tbe east end of tbe third-story ball, where tha sun was shining in. It is concluded tbat the fire was started hy a dimple in the wiadow glass contracting the sun's rays.

GOOD HEALTH.

Electrical Remedies.

A contemporary gives tho followiag: Tbe number of electrical appliancee for wearing upon the human body are almost numbarless. Toore are many paople who beliave that aleotrical helts, brushes, combs, etc., have a stroag curative powar. There are also found people who will carry a piece of potato in their pocket as cure for rhaumatism. The latest fad in this lina is to carry a bit of electric arc-light carbca, that some of the electricity left over from last night's lighting may soak into their hodies and ease up on tha pain a trifle.

All these notions have not the least foundation; a person may stand hetween the poles of the most powerful magnet yet laventod, and stroag enoagh to lift hundreds of ponads of iron, and never feel tha slightest magaetism, either for good or for ill. A theory is in axistence that tbe magnatism attracts the iron in the hlood snd thus starts up a better circulation. All tbe iron that exists in the human system is combined with hydrochloric (muristic) acid and is in the form of the oxida of that metal, snd in this form the magnet has no power over tbe oxida of iron; and if a person's blood does not oirculate until it is started up by magnetic effect npon iron contsined therain, it would not oirculate more than nnce during the coming century.

There is a great deal in tbe use and abuse of imaginstion, and people who are taken violently ill after ridlng a few blocks on electric cars ara ready to be reted as first-class cranks as far as imagination is concarned. A current of *electricity* passing through the body may benefit hy agitating and perhaps decomposing certain portions of the tissue, hut *magnetism* has no effect whatever npon the human syatem.

A little electricity goes a great way in this respect; physicians, in giving alactrical treatment, usa from one to five one-thousandths of an ampera. From two to four amperes passed throagh tbe vital parts of the humau body is sure death. Tha tissues cannot staad so violent an agitation. Tha resistance of the hody is so great that hundreds snd perhaps a thousand volts nressnre is necessary to force this amount of current through the body.

When mesning to take a little magnetism or electricity for the hody's good, it might be well to have the electricity applied hy a responsible physician, hut do not go to the trouble of taking your ride on the field magnet of a light dynamo, or sandwich yourself between the poles of a big alternating current machine.

HEALTH OF THE STATE.—The report of tbe State Board of Health gives mortality reports for November from 103 localities, with an estimated population of 752,739. It shows an annual mortality at the rate of 18.60 per thousand, which is the largest death rate we have had for many months. This increase is due to the increased area of country in which diphtheria, typhoid fever and acute palmonary diseases have been present. The mortality from pneumonia, for instance, just doubled that for October, and the deaths from diphtheria and croup were also largely in excess over the preceding month. Consumption caused the death of 157 persoas—an increase over last month. Pneumonia was fatal in 110 instancee, bronchitis caused 24 deathe, congestion of the lungs was fatal in 19 cases, and whooping cough caused two deaths. Diphtheria is credited with 58 deaths, which is a largely increased mortality over last report. Thirty-seven of these deaths occurred in San Francisco.

DANGER FROM MUSICAL INSTRUMENTS.—A French military surgeon has been making researches on wind instruments which had been used hy phthisical handemen, and warns musicians of the importance of disinfection. He recommends that instruments should be filled with a five per cent solution of carholic acid, or, in tbe case of metallic instruments, that they should be dipped into hoiling water. These precautions are of the utmost importanoe when phthisical persons have used the instruments; for it wss found in such cases that liquids used to wash them ont presented a virulence similar to that of a pure culture of tuberculosis. Happily, the danger is small as long as the interior is thoroughly moist, which of conse it usually is; but when an instrument bas heen lying hy for some time, so that the interior has hecome dry, there is real danger of air containing dried germs of the disease being drawn into the lungs of the person who next plays upon it.—*New York Ledger.*

SCIENTIFIC STUDY OF DRUGS —Bnt little is known of the action of drugs on the human body in health. For a number of years an English hiologist, W. Sharp, has heen experimentlog to determine this action, using different quantities of the same drug, and he has reached some interesting conclusions, including the following: The smallest doses used in these experimente have power to act upon the human body; the commonly received opinion that the action of drnga is simply increased in degree and not altered in character by increasing the dose, is an error; the actions of drngs are sufficiently distinct to admit of classification.

ENGINEERING NOTES.

Engineering Progress.

The *Stationary Engineer*, in urging tbe necessity of study upon youag engineers, says:

Granted that owners are sometimes short-sighted and are over-inclined to value your services in inverse ratio to the money you demand for them. Do you intend always to work in the same place? Do you not rather cherish the honorable ambition to better your condition whenever opportunity offers? Do you ever stop to consider the great changes which have taken place in the character of tha steam plants of this country, and that the change is still going on in a constantly accelerating ratio? Some one has well said that there is always room at the top; and in the stationary engineer's trade this room at the top is growing larger all the time. Think the matter over, and you will soon he convinced that not one of the mechanical trades has in it more of possihilities for tha future, or offers more encouragemant to hard study, patient industry aed steady application than the one you have chosen.

It is not so very many years since tha old-fashioned slide-valve aagine, with its box-bed and trotting governor, was to ha found in nearly every engine-room. Now it is hardly thought of except for the smallest and cheapest plants. It is scarcely a dozen years since tha first successful attempt was made to build Corliss engines in tha West. To-day there are dozens of hnildare of this and other types of high-duty engines. The automatic cut-off engines have driven the slide valve nut of tha market, except for small powers. Compound engines are common, and tripla and quadruple engines are not only heing talked of, but are being placed in operation, and will undonhtedly be as generally used in stationary practice as they are now in marine engineering. Thousands of first-class plants are in daily service, and the demand is growing steadily. Every one that is put in service calls for skilled attendanca and farnishes work for a good engineer.

The signs of the times all point to a continuance of the attempt at still further improvement in the economy and efficiency of the modern high-duty steam plant. As a natural result the demand for skillful, educated engineers is increasing. Not only this, hut the nnmber of first-class power plants is rapidly increasing to meet the manifold requirements of our later-day civilization. Naturally, the engineers who study tbe hardest, and are the most thoroughly posted in the practical details of tbe trade, will get the best positions, and the best positions are worth working for.

THE CORINTH CANAL.—The Corinth canal, which will sever the Peloponessus from tbe mainland of Greece, and will permit the largest ships to pass directly from tbe Gulf of Athena to the Gulf of Corinth, is said to he rapidly approaching completion. A recently published account gives some interesting particulars concerning the undertaking. The work was begun some eight years sgo by a French company. It was to have been finished in 1887, hut various troubles delayed it, and now 1895 is named as the earliest date on which it can he opened for traffic. The canal will have no locks, but is level from end to end and perfectly straight. It is to he 96 feet wide and 36 feet deep. At the Corinth end it is crossed by a railroad hridge 164 feet high, nnder which the tallest ships may pass without lowering their topmasts. With the exception of about 200 yards in the center, the channel, it is said, has already been excavated down to the sea-level, and water has heen admitted for about half a mile at the Corinth end and half that distsnce at tbe other. The total cost of the canal is reckoned at $14,000,000. It is assumed that about 300 vessels from Trieste and Fiume, and es many from Italian ports, will pass through the canal annually, while it is calculated tbat 730 Greek ships will use the canal. This would give a total of 1230 vessels annually, of an average tonnage of 1500 each. It is proposed to levy a toll of 20 cents per ton on vessels comiag from the Adriatic, and 10 cents on all other vessels, hesides 20 cents for every passenger. This is estimated to yield an annual revenue of $300,000.

MASONRY IN ENGINEERING.—Fuel, heat and power are hardly more essential in the work of civil engineering than the perfection of masonry in connection with all important enterprises, as it lies at the foundation of nearly every class of construction, and so much of stability and adaptetion are involved in a true understanding of its principles. Every bridge, culvert, viaduct, squeduct, tunnel, seawall or edifice is dependent upon its correctness of structure, and in view of this importance it necessarily hecomes a study in intimate relation with architecture and the conservation of mechenical appliances.

THE LATEST PROJECT IN INDIA of railway extension consists of a line of railway running parallel with the east coast, connected with the Bengal-Nagpur railway, affording to the southeastern districts of the central provinces direct means of access to the sea. The Ceylon railway authorities are laying down a line of railway in Colombo, which will probably be continued to Matwal.

Passing Events.

The past week has come and gone without impressing itself deeply on the mining history of the country. It brought with it no startling incidents or events to record, the which is perhaps matter for thankfulness. Better a tame week than one marked with disasters, and these we as a community have fortunately been spared. Christmas found us a generally prosperous and happy people. Our affairs, public and private, are calculated to inspire us with profound gratitude, the conditions of life in California being so incomparably better than in any other country, even the most favored. We experience here no pinching cold, no oppressive heat, no dire want. We enjoy a large aggregate of comforts, far more than the average of mankind. With us the general health is good and the death rate low. Appreciating these and numerous other blessings, the popular heart was inspired with devout and grateful feelings on this natal day of the Redeemer.

WILL APPEAR NEXT WEEK.—Another number (24) of the series of articles on San Bernardino county, prepared for the PRESS by James H. Crossman, will appear in our next issue, it having been unavoidably left over by reason of the overcrowded state of our columns of late.

The Real Death Valley and the Mythical.

There appeared in the last issue of the PRESS a somewhat lengthy description of Death valley, an arid and forbidden locality situated on the easterly border of this State. In reproducing that article from one of our metropolitan dailies, we did so, not with the intention of indorsing its correctness, but the rather with the purpose of pointing out certain of its inaccuracies and rectifying the same, these being altogether mythical and misleading. In so far as the writer of that article deals in mere generalities, surmises and impressions, these may be allowed to go for what they are worth. But when it comes to statements of facts, these, where wide of the truth, would certainly seem to call for correction.

Before proceeding to act the critic, it is proper to premise that we have undertaken this task reluctantly and not in a spirit of censoriousness, having been constrained thereto purely in the interest of truth and science. If this Death Valley region is not the dangerous and dismal waste generally represented, it is proper the Government, in preparing an expedition to explore it, should be advised of that fact, to the end that no uncalled-for expense be incurred in fitting out the same; and so, for the same reason and in like manner, should the expeditionists themselves be saved from providing what might afterward be found a useless incumbrance. Moreover, it is the case that the prospector and the miner should not be allowed into a country difficult to be reached and of doubtful mineral wealth through the extravagant stories related by mere Bohemians and romancers.

How necessary are the above precautions will be made apparent when we come to examine a little more closely the article in question. For example, we find therein the following statement during the mining fever extending from 1872 to 1873: "Hundreds of people perished in attempting to get across this valley." What fever the writer alludes to is more than we know. If he means to convey the idea that there ever prevailed an excitement that caused any large number of people to visit Death valley, or that several hundred or any other considerable number of lives were there lost during that period, we think he is laboring under a misapprehension. We never heard of any such movement, nor do we believe any ever occurred.

As to the number of persons who have been lost in this locality, it does not probably exceed 30 all told, the most of these consisting of the immigrant party who, to the number of 13, perished there in the summer of 1849 while attempting to make a cut-off on their way to California. If as many more lives have since been lost there, we have no authentic record thereof. This immigrant party, composed largely of women and children, were no doubt the first whites to succumb to the heat and want of water in that fatal spot. That none of the aborigines ever fell victims to either, it is useless to state.

It becomes imperative, says our informant, that adventurers into that region make provision for taking along an abundance of water, the necessity for this being enforced with the remark that three gallons daily per head is as little as will suffice to sustain life; with less, the blood of the unhappy individual "becomes thickened, the features grow thin and peaked, dreadful constipation sets in and fever threatens madness." When crossing Death valley several years ago, we found a much less quantity of water than this quite enough to satisfy the cravings of thirst, nor when, as occasionally happened, the supply ran a little short, did such extreme suffering, with the dire results here described, at once ensue.

This is not to say that parties contemplating a trip into this notable depression can safely disregard the precaution suggested, unless, to be sure, they know the sites of the springs in the mountain canyons adjacent or have with them some one conversant with their location. If they possess this knowledge or will take care to pick up an Indian in the neighborhood to act as guide, they need never load down their animals with more than one day's supply of water, or two at the most. As there is water, so is there wood and grass to be obtained in the mountains, close by on the east but from 10 to 15 miles distant on the west, none of these prime necessities being, even in the mountains, overabundant. There is always there grass enough to subsist the animals and wood enough for camp purposes, but the springs, never copious, are found in only a few of the canyons, all of the watering-places being, however, known to the Indians residing anywhere near.

But while enough of these indispensables, suitable precautions being taken, can be found to meet all needs, he who hazards into this hot and drought-y realm may not presume on local resources for other supplies. Both animal and vegetable life are now notably absent, their dearth being nearly as great as that of wood and water. The animality of the district includes little more than lizards, rattlesnakes and horned toads. The Government, we are told, is anxious to ascertain and catalogue both the fauna and the flora of this vast receptacle of sand, soda and salt. It is a commendable if not very formidable undertaking. If now the Government, moved by such laudable ambition, will consult some of the earlier reports of the United States Geological Survey it will find there recorded and ready for its use about all the data extant or procurable on that subject. If these reports shall be found a little difficult, it must be remembered that the collection of the facts therein contained was a case of the "pursuit of knowledge under difficulties."

In regard to the rich gold finds reported as having at various times occurred in Death valley and vicinity, these are quite as apocryphal as the high death rate assigned that delectable locality. There are, in fact, no well authenticated cases of the kind; they are mostly myths, pure and simple, and it is to be hoped that our miners will not be induced to go in search of these reputed finds by reason of this renewed attempt to give them unmerited notoriety.

Pioneer Gold Mining.

Handicapped by Many Disadvantages.

It has generally been supposed that the business of gold mining in California was inaugurated under circumstances especially favorable to the growth and early perfection of that industry; this is the theory held by most early residents of the State, and the historical view taken of that event. To suggest the contrary would be held by the average pioneer a grievous heresy. It has, in fact, been the wont of our people to congratulate themselves on the auspicious conditions under which gold gathering was here first carried on. And yet this view of the situation is clearly untenable. Our great industry was, at its inception, handicapped by the worst possible surroundings—surroundings so bad that it was sadly stunted in its growth, the effects of that dwarfage being seen and felt to this day.

Gold during the first decade was, to be sure, plentiful and easily obtained; and right here lay the trouble. The early miner, because he could earn big wages with little exertion, soon became improvident and careless. This stage reached in his downward course, it was but a step farther to idleness and dissipation, the end of which was early and absolute ruin. This, of course, was not the fate of all, or even of a majority, but it was of a great many, such condition of things having proved generally hurtful and demoralizing. Habits of this kind contracted during the flush times adhered to the individual after these were over, leaving him a moral and a physical wreck.

But the facility with which gold could at first be obtained, while it so tended to demoralize the miner, worked to the detriment of mining as well. When the quartz veins and the deep-lying placers came to be opened, the shallow diggings having been exhausted, our miners had as little stomach for this more arduous kind of work as they had money to pay for its performance. Hence, this class of deposits was neglected or attacked in only a faint-hearted sort of way, such of these men as had sufficient means either leaving the mines or emigrating to other countries in search of virgin placers.

How different probably would all this have been had there been found in California only vein mines or deep placers at the start! With such deposits only to deal with, there would have been little to induce dissipation, idleness and unthrift. Their development requiring capital, skill and good management, the malign influence and conditions that so obtained in the early days would have been largely if not wholly absent. The bulk of laborers, everything considered, would have fared equally as well as they did, while the business of mining would have been immeasurably further advanced than we now find it. So far as solid progress is concerned, fully a third of the time that has elapsed since the discovery of gold in California has been virtually lost.

During the first decade of the gold era, there was to be seen here only a wild scramble after pelf, nothing but adventurers swarming in from other lands all intent on that one object, but careless of everything else besides; California during all these years having been converted into a sort of "grab-bag" for all the world. Never could mining in this country have met with large development, nor could any other substantial industry have obtained here an enduring footing had this condition of things continued to prevail.

A nomadic people can never make rapid progress in civilization, nor are they apt to attain to a high morality. They must themselves become permanent before they can establish permanent institutions and industries. Intelligence must be combined with labor, brains with brawn, before useful callings can prosper or other solid advancement be made. Ready to pack his blankets and scurry away in search of new diggings on the slightest intimation that such had been found in some distant locality, the early miner would never have done much towards making California what she is to-day. The home of the miner was then hardly more than a Gypsy camp, his hold on society as slight as that of a Bedouin of the Desert. The digging of gold in the primitive times here alluded to called for hardly more skill or labor than the digging of potatoes—not half as much of either as is required for the successful cultivation of that useful tuber.

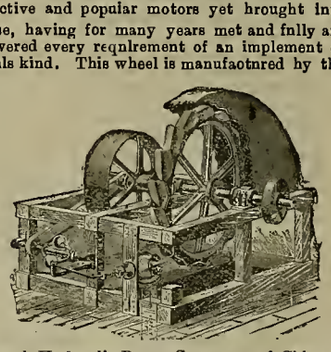
The pioneer miner was a man of many good qualities, brave, generous, hardy and industrious enough when there was big pay in sight, not often otherwise. He was a pathfinder and an explorer. He was a man to discover good places for homes, but not to make a home for himself. The country and the world owes much to him, and we would be the last to disparage his virtues or depreciate the value of his services.

But it seems to us the day has come when we may properly cease to deplore the passing away of those flush times about which we hear so much, and so many, in their ignorance, would gladly see restored. Their advantages, such as they were, have been greatly overrated, partly because they have been sung so much and partly because they have been so widely lamented.

Let, then, the present generation, be advised that they have lost but little in not having lived in the wild and wasteful period here commented upon, and let the California of to-day be advised that it gained less through the existence of that period than has generally been supposed.

The Tuerk Mining Wheel.

The above cut represents what is known as the Toerk Mining Wheel, one of the most effective and popular motors yet brought into use, having for many years met and fully answered every requirement of an implement of this kind. This wheel is manufactured by the



Tuerk Hydraulic Power Company, of Chicago, and by them supplied with their automatic governor, which materially increases the efficiency of their motors for dynamo and all other work calling for close regulation of speed. The mechanisms of this company are said to be gaining favor both with the mining and manufacturing public.

OUR ARTICLE ON CHLORINATION.—We reproduce in this week's PRESS an article on chlorination, prepared by Wm. Irelan, Jr., State Mineralogist, and published in his annual report for 1886. We do this because there has been much inquiry for that report, which, being out of print, can no longer be had. This article is suggestive rather than exhaustive, dealing with the subject treated of in a general way. It was made short that it might be conveniently reproduced by the mining press, as it probably will be quite generally, now that the volume in which it originally appeared is difficult of obtainment. An additional reason for the brevity of this article is found in the fact that several works on chlorination had appeared or were about to do so at the time of its preparation, to some of which Mr. Irelan had himself contributed.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 16, 1890.

443,064.—GOVERNOR FOR GAS ENGINES—Barrett & Daly, S. F.

443,083.—SYRINGE—E. Bartsch, S. F.

442,939.—WAVE-POWER—J. Beermaker, Santa Barbara, Cal.

442,700.—CAR BRAKE AND STARTER—E. Chaffey, Santa Monica, Cal.

442,961.—FIRE-ESCAPE—E. W. Dixon, Forest Grove, Or.

442,963.—ROTARY GAS ENGINE—J. H. Eichler, S. F.

442,692.—MACHINE FOR MAKING ROCK-DRILL BITS—S. C. Lewis, S. F.

442,814.—CAR COUPLING—J. E. Marshall, Martinez, Cal.

442,815.—MACHINE FOR REDUCING BITUMINOUS ROCK—W. Meakin, S. F.

442,906.—DISH-WASHER—Addie D. Miller, Portland, Or.

442,779.—VEHICLE WHEEL—V. F. Mogk, Seattle, Wash.

443,002.—DOUBLE CUTTER-BAR FOR HEADERS—Plumtree & Tonnett, Spokane, Wash.

442,780.—WHEEL FOR ROAD ENGINES—R. B. Page, Oakland, Cal.

442,644.—FOUNTAIN PEN—P. B. Smith, Alameda, Cal.

442,762.—VAPORIZING SPRAY NOZZLE—W. Wainwright, S. F.

442,837.—PIPE COUPLING—H. B. Ward, San Diego, Cal.

442,652.—STREET RAILWAYS—Watriss & Heynemann, S. F.

442,838.—NAIL HEAD—O. F. Wegener, Seattle, Wash.

442,845.—ANIMAL TRAP—White & Murphy, Pomoca, Cal.

442,835.—ENGINE—J. C. H. Stut, S. F.

The following brief list by telegraph, for Dec. 23, will appear more complete on receipt of mail advices:

California—George B. Allen, San Leandro, baling press; Fay Butler, Oakland, bitt file; Thomas C. Hope, San Francisco, combined and adjustable screen and window-shade fixture; Charles C. Davis, Los Angeles, device for inducing full respiration; Bert Franken, Pomona, lawn sprinkler; Thomas B. Jordan, Los Angeles, fruit-pickers' knife; Lewis M. Lloyd, San Buenaventura, wave and tide motor; John McMullen and H. S. Wood, San Francisco, and H. Krusi, Alameda, canal-digging machine; John Schroeder, assignor of one-half to H. L. Raschen, San Francisco, propulsion of vessels; James Tulloch, Angel Camp, ore concentrator. Oregon—Matthias Jensen, assignor of one-half to Jensen Can-Filling Machine Company, Astoria, seaming machine; Andrew C. Mack, Portland, millinery hat or bonnet box; Levi M. Sharps, deceased, Lake View, by W. M. Sharps, administrator, water wheel.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

VIEW OF MT TACOMA FROM AMERICAN LAKE.

EASTERN VISITORS TO CALIFORNIA IN SECTION OF BIG TREE AT VISALIA, CAL.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ANIMAL TRAP.—Frank White and Frank J. Murphy, Pomona, Cal. No. 442,845. Dated Dec. 16, 1890. This invention is a trigger for those traps which have spring-controlled jaws, and are usually made of wire. The trigger consists of a notched plate having inner and outer shoulders at its base for pressing against the jaw stems to hold the jaws open and a flange at each side resting on said stems, the flange on one side extending forward and the flange on the other side extending backward. These flanges serve as levers to disengage the shoulders when the plate is tilted in either direction.

ENGINE.—John Ch. H. Stut, S. F. No. 442,835. Dated Dec. 16, 1890. The invention consists in certain constructions whereby a series of engines connected with a single driving shaft may be coupled together in such a way that any one or more of the engines may be uncoupled and the others coupled together, in order to be used while the disconnected engine or engines is or are out of use. The patent shows a triple expansion engine driving a common shaft, and a series of pass pipes and valves by which the result may be effected of temporarily cutting out one or more of the engines, leaving the others operative. A similar arrangement may be had for more than three engines.

A Large Tree.

The cut herewith presented shows what is left of one of California's big trees. Although these remains show little more than the bark, this sufficiently denotes what was originally the size of this monster of the forest, its diameter having been something over 20 feet. This tree grew in the reservation in Tulare county, where one of these sequoia gigantea of much larger size is reported to have lately been found. According to accounts, this late find measures 124 feet in circumference. Among the California big trees, none has shown a larger girth than this, though many have short equaled it.

A Washington Scene.

Mt. Tacoma, as seen from American lake, is one of the grandest sights of the Northwest. Rising abruptly to a hight of many thousand feet, and crowned with a chaplet of snow, it forms one of those periods of Nature which leaves an indelible impress upon the beholder. The placid surface of the lake is covered with small verdure-clad islands, and forests stretch away from its shores.

A Great Repository of Practical and Scientific Information.

One of the Fullest, Freshest and Most Valuable Handbooks of the Age. Indispensable to Every Practical Man.

NOW READY.
Price $2.00.
Free of postage to any address in the world.

THE TECHNO-CHEMICAL RECEIPT BOOK;

Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Elsner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling, with additions by Wm. T. Brannt, Graduate of the Royal Agricultural College of Eldena, Prussia, and Wm H. Wahl, Ph. D. (Heid.), Secretary of the Franklin Institute, Philadelphia, author of "Galvanoplastic Manipulations." Illustrated by 78 engravings, one volume, over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price $2.00, free of postage to any address in the world.

☞ *A circular of 32 pages, showing the full Table of Contents of this important Book, sent by mail free of postage to any one in any part of the world who will furnish his address.*

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from ¼ to 3 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, **Railroad and Merchant Iron,** Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

☞ Orders will have prompt attention. Send for Catalogues. Address

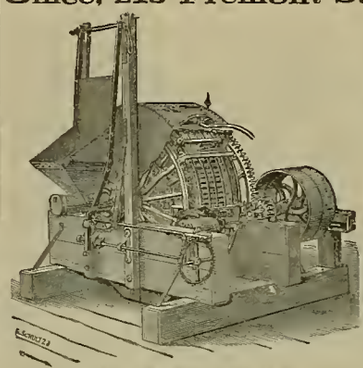
PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS,

HINCKLEY, SPIERS & HAYES, Proprietors.

[ESTABLISHED IN 1855.]

Office, 213 Fremont St., San Francisco.



TUSTIN'S PULVERIZER.

—MANUFACTURERS OF—

MARINE ENGINES AND BOILERS.—Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

Tustin's Pulverizer
WORKS ORE WET OR DRY.

ENGINES AND BOILERS
OF ALL KINDS,
Either for use on Steamboats or for use on Land.

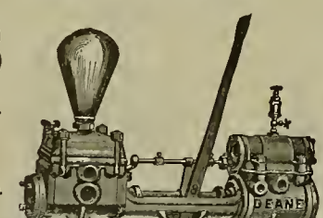
Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries
OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:
Corliss Engines and Tustin Ore Pulverizers.
Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.



DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safe in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist,

718 MONTGOMERY ST., - SAN FRANCISCO.

☞ Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

MINING ENGINEERS.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest Coast.

Having the largest permanent brick assay furnaces, chemical laboratory and mining office on the Northwest Coast, with a collection of about 4000 samples of the ores of Alaska, British Columbia, Oregon and the Northwest Territories; and having made personal examinations of nearly every mining camp on the Pacific Slope, from California to Alaska, I am prepared to do any class of legitimate and honest mining work, such as EXAMINING, ENGINEERING, SAMPLING AND REPORTING ON THE VALUE OF ALL MINERAL, COAL AND FIRE-CLAY PROPERTIES, BUILDING STONES, EARTHS, ASSAYS AND ANALYSIS OF ORES, WATERS, CHEOK, SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS" WORK, and in fact any work connected with the office of a first-class mining geologist and chemist. Any information mining men may desire to know relative to the MINERAL OR COAL RESOURCES of the entire Pacific Northwest will be honestly given. Address **Dr. Willis E. Everette,** Consulting Mining Geologist and Chemist, 1318 E Street, Tacoma, Wash.

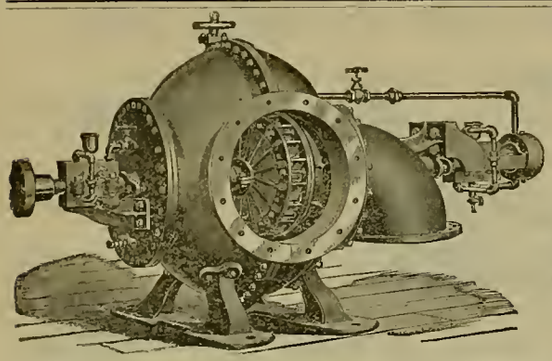
SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.



JAMES LEFFEL'S

Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by bolts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to W. M. SMITH, 526 Jones St., San Francisco.

Don't Fail to Write.

Should this paper be received by any subscribor who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

The German Savings and Loan Society.

526 California Street.

Stationary and Compound Engines, Flour, Sugar, Saw and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description

ALL WORK TESTED AND GUARANTEED.

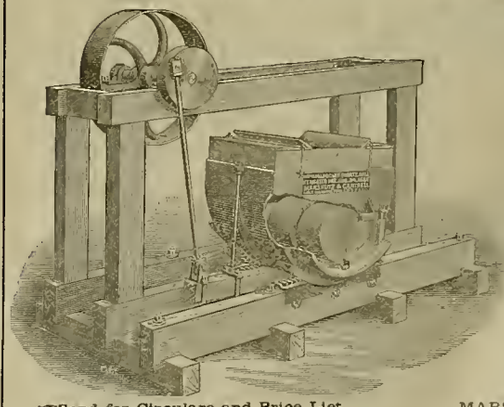
IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.



The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL.

WATER MOTORS and VENTILATING FANS

OF EVERY DESCRIPTION.

AUTOMATIC GOVERNOR MOTORS our Specialty, for Electric and other fine regulation work. Our new MINING WHEEL with GOVERNOR a great success. Send for new Catalogue.

IMPORTANT TO GOLD MINERS!

SILVER-PLATED AMALGAM PLATES for SAVING GOLD

IN QUARTZ, GRAVEL AND PLACER MINING.

PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts

San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.

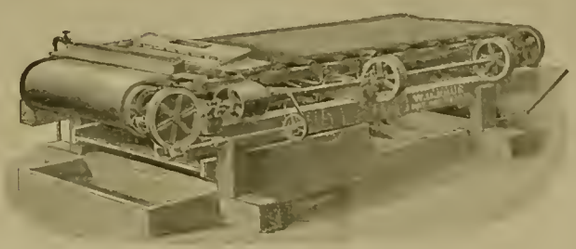
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, $825, f. o. b.
Price of Plain Belt Frue Vanner, $575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.



Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

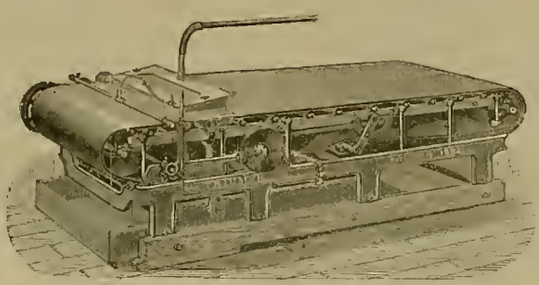
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Trinmph" Ore Concentratore, the "Frue" Vanners and other forms of concentrating devicee, do not warrant the assertion that the "Frue' Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Trinmphs;" for, when desired, they (the "Triumphe") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - - $650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - - - $550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.



JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Trimmph Ore Concentrators, that four (4) of them were placed in the mill of the Original Emipre Mill and Mining Company in April, 1884, and a thorough test made of their practical oper tion; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vannors or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

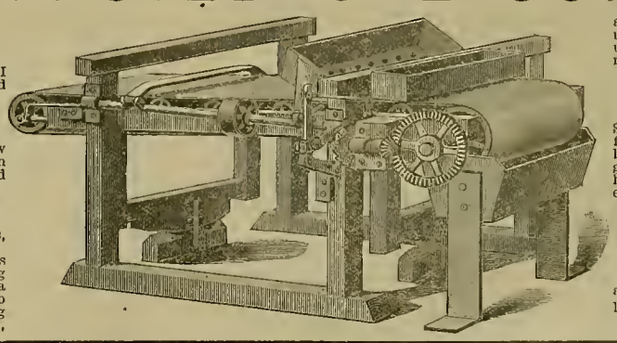
N. B. When the stamping capacity of the two above named mills was increased, more "Trimmph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

TULLOCK IMPROVED ORE CONCENTRATOR.

Patented October 8, 1889, and December, 1890.

ANGELS, CALAVERAS COUNTY, Nov. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: I am pleased to state that I have used two (2) of your Sulphuret Concentrators in the Gold Cliff Mill, since the first day of last May, and that they have given entire and splendid satisfaction, concentrating the sulphurets from 60 tons of ore every 24 hours. Your Sulphuret Concentrators are superior to any that I have seen, being simple in action, positive in effect, admirable in construction, of few mechanical parts, and admirably adapted to the concentration of any kind of sulphurets. I therefore cheerfully recommend them to the mining fraternity. Respectfully yours,
WOODSON GARRARD, Supt. Gold Cliff Minc.

HELENA & IDAHO GOLD MINING CO, SUPERINTENDENT'S OFFICE, GIBBONSVILLE, IDAHO, Oct. 6th, 1890.
MR. JAMES TULLOCK, Angels, Cal.—Dear Sir: Mr. Arnold was saying the other day that you were talking something of coming up this way, and I have thought that perhaps you might be a little uneasy about your concentrators. You need have no anxiety about them whatever, as the one we set up is running all right and has not given a minute's trouble since starting,



and the other one is all ready to start. They were so easy to set up and run that I forgot all about the "letter of instructions" until they were set up and running and you recalled to my mind your letter and instructions. Yours truly,
MYRON K. RODGERS, Supt.

ANGELS, CALAVERAS CO., Nov. 22, 1890.
JAMES TULLOCK, ESQ.—Dear Sir: We have used two of your Sulphuret Concentrators in the Madison Mill, (10) ten stamps, for over six months last past, and I hereby testify that they have given every satisfaction, and in every sense fulfilled the great opinion I had formed of their superiority. They are easily handled, readily kept in order, require but little watching, are exceedingly simple in construction and absolutely positive in their work. In my opinion, they are superior to any other in the market, doing effective work in the treatment of large quantities of sands. Sincerely yours, T. M. LANE,
Supt. Madison Mine.

Price, $350, delivered at Factory, Angels, Calaveras Co., or at Milton railroad station free of charge. For further particulars, address

MINING
—AND—
Ore Dressing Machinery.

By C. G. WAMFORD LOCK.

CONTENTS.—Motive Power—Transmission of Power. Quarrying—Prospecting, Shaft-sinking, Coal-cutting, Pumping, and Ventilating Machinery—Lighting—Hauling and Hoisting Transport—Reducing—Dressing—Miscellaneous.

Price $21.00. Circulars and Catalogues on application.

E. & F. N. SPON, Publishers,
12 Cortlandt St., New York.

FRANCIS SMITH & CO.
Manufacturers of
Sheet Iron and Steel
PIPE!
ALL SIZES.
130 Beale Street, San Francisco, Cal

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

GRANGER'S ROLLER STAMP MILL
Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

"A RIGID EARTH," being devoted to Geology as Applied to Mining. By STEPHEN BARTON. In this work the author addresses himself to intelligent Miners who have, to some extent at least, familiarized themselves with the accepted theories of elementary geology. He has grouped together numerous observed facts tending to d sprove the ferneous theory, and to establish the proposition that below the action and influence of the atmosphere all fissures grow narrower with depth—that metal-bearing veins are produced by causes acting near the surface; and that the realm of successful mining never penetrates the earth one mile. PRICE $2.00. J. C. WARD, General Agent, 69 Main Street, Visalia.

ATTENTION, MINERS!
— A FIRST-CLASS —
Union Rock Breaker
For Sale Cheap.
2500 MISSION ST., SAN FRANCISCO

JAMES M. HAVEN. THOMAS E. HAVEN, Notary Public.

Telephone No. 1746 SAN FRANCISCO, CAL.

THE RUSSELL PROCESS.
For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to
THE RUSSELL PROCESS CO.,
Park City, Utah.

INVENTORS, TAKE NOTICE!
L. PETERSON, MODEL MAKER,
258 Market St., N. E. cor. Front (up stairs), San Francisco
Experimental machinery and all kinds of models. Tin and brasswork. All communications *strictly confidential.*

A GOLD-MILL SUPERINTENDENT
Of long experience, assayer and practical chemist, desires an engagement, particularly in a mill where gold and amalgam is wasted. The best of references given. Address E. W., 1278 Tenth Avenue, East Oakland.

COAL MINES OF THE WESTERN COAST.
A few copies of this work, the only one ever published treating of Pacific Coast Coal Mining, have been obtained, and are for sale at this office for $2.50 per copy. It was written by W. A. Goodyear, Mining and Civil Engineer, formerly of the California State Geological Survey.
